APPARATUS FOR STRIPPING ELECTRIC CABLES

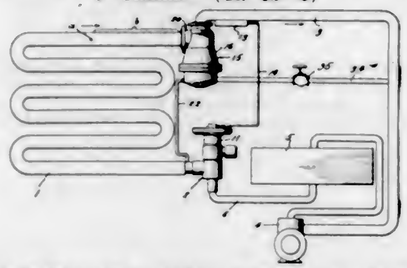
Charles Percy Seckham, Wakefield, England

Application September 29, 1934, Serial No. 746,261

In Great Britain October 19, 1933

5 Claims. (Cl. 164—61)

1. A cable stripping machine comprising in combination, a cutter member, a work sustaining member arranged in opposition to the cutter and between which and the cutter the work is adapted to be forced, separate carriers for said cutter and work sustaining members, means for adjusting at least one of said carriers toward and from the other, and a spreader member carried by said adjustable carrier and disposed in the path of the severed portion of the work as it leaves the cutter member for spreading the same, said spreader member being adjustable relative to the cutter member and said spreader member being wedge-shaped and having a pointed entrant end and a flared rear end whereby the latter will spread the cable covering to substantially expose the cable therein which is to be removed.



2,099,085

SUPERHEAT CONTROL FOR REFRIGERATION SYSTEMS

John L. Shrode, St. Louis, Mo., assignor to Alco Valve Company, Incorporated, St. Louis, Mo., a corporation of Missouri

Application June 8, 1936, Serial No. 84,203

9 Claims. (Cl. 62—3)

1. Refrigeration system including an expansion valve, an evaporator and a thermostatic control device for said evaporator, serially arranged, and means between the suction end of said evaporator and said thermostatic element, preventing the temperature of refrigerant in liquid state directly affecting said thermostatic element, by arresting refrigerant in liquid form which may be entrained in the effluent refrigerant gas from said evaporator.

2,099,086

LAMINATED GLASS

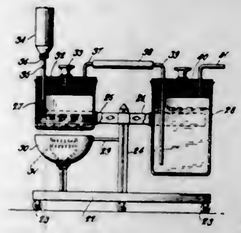
John S. Tinsley, New Brunswick, N. J., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application September 17, 1934, Serial No. 744,366

4 Claims. (Cl. 49—92)

1. A laminated glass including a layer of substantially optically clear plastic comprising a hydrolyzed mixed ester of cellulose produced by heating the mixed ester, after its formation and after neutralization of the acid catalyst employed in its formation, in the presence of an acid corresponding to an acid radical of the mixed ester.

2,099,087



APPARATUS FOR EFFECTING SEPARATION OF THE PARTS OF DENTURES

Alva James Vance, Beverly Hills, Calif.

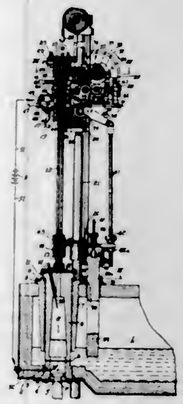
Application July 17, 1936, Serial No. 91,243

3 Claims. (Cl. 32—1)

1. A dental apparatus for effecting separation of the parts of denture assemblies, comprising a support, a closed receptacle mounted on said support, a body of acid in said closed receptacle in which a denture assembly may be completely immersed, heating means supported in said base adjacent said closed receptacle whereby said acid bath is heated, a second closed receptacle mounted on said support adjacent the first closed recep-

tacle, a neutralizing bath in said second receptacle, and means for conducting fumes from said acid bath to a point beneath the surface of said neutralizing bath so that such fumes will be discharged in said neutralizing bath to be neutralized thereby.

2,099,088



METHOD AND APPARATUS FOR FEEDING MOLTEN GLASS

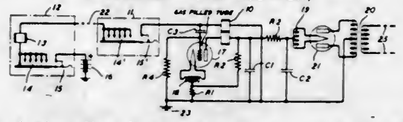
Frank L. O. Wadsworth, Pittsburgh, Pa., assignor to Ball Brothers Company, Muncie, Ind., a corporation of Indiana

Application June 25, 1934, Serial No. 732,216

Renewed January 14, 1937

22 Claims. (Cl. 49—55)

1. A feeder for delivering successive mold charges through a submerged orifice, comprising a reciprocable bell above said orifice, means for reciprocating said bell, means responsive to the movement of the bell away from said orifice for connecting the interior thereof to a source of subatmospheric pressure as the bell approaches the upper end of its stroke, means responsive to the movement of the bell toward said orifice for connecting the interior thereof to a source of super-atmospheric pressure at the end of its downward stroke, and means for maintaining such latter connection at the beginning of the upstroke of the bell to trap a quantity of said super-atmospheric pressure in said bell and prevent the retarding of flowing material through the orifice.



2,099,089

RELAY

Allan Weaver, Port Washington, N. Y., assignor to American Telephone and Telegraph Company, a corporation of New York

Application December 4, 1935, Serial No. 52,928

7 Claims. (Cl. 178—88)

1. A signaling line relay, a line circuit including circuit closing means, a line winding wound upon said relay and connected to said line circuit, an auxiliary circuit including a single gaseous discharge device, an operative connection between said auxiliary circuit and said relay for controlling said discharge device and for supplying additional energy to aid in the operation of said relay when said line circuit is closed.

2,099,090

PROCESS OF MAKING HYDROCARBON RESINS

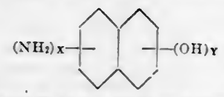
William L. Webb, Chicago, Ill., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application February 7, 1936, Serial No. 62,816

6 Claims. (Cl. 260—2)

1. In the process of making high molecular weight products from reactive olefins by polymerization of mixtures of the desired iso-olefin hydrocarbons with other olefins, in the presence of a metal halide catalyst hydrolizable by water, the temperature of said polymerization being maintained sufficiently low to permit the polymerization of the desired iso-olefins and substantially prevent the polymerization of other olefins, the improvement comprising deactivating said catalyst at a temperature below 0° F. after the desired polymerization reaction is substantially complete and before the temperature is allowed to rise to a point where the polymerization of other olefin hydrocarbons occurs.

2,099,091



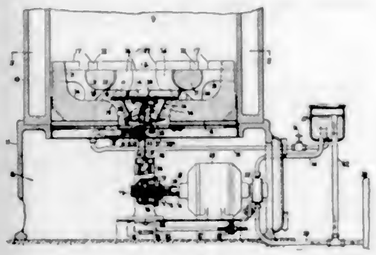
PRINTING AND DYEING COMPOSITIONS AND PROCESSES

Frithjof Zwilgmeyer, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application October 10, 1935, Serial No. 44,329

20 Claims. (Cl. 8—5)

4. The method which comprises mixing the diazoimino compound, of a diazotized primary arylamine free from water-solubilizing groups, in a non-acid medium with an hydroxy arylamine of the naphthalene series represented by the formula:



in which X and Y are each 1 or 2, impregnating a material therewith, and acting thereupon with acid until the color is formed.

2,099,092

LIQUID FUEL BURNER

Edwin E. Arnold, Pittsburgh, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application March 24, 1934, Serial No. 717,137
7 Claims. (Cl. 158—4)

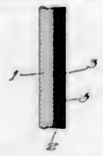
1. In liquid fuel burning apparatus, the combination of a furnace having a combustion chamber therein, a hearth arranged at one end of the combustion chamber and including a wall defining an end of the combustion chamber and an annular structure disposed in said combustion chamber and spaced from the wall, said wall and annular structure having surfaces opposed to each other and forming a passageway which converges and diverges from adjacent a central portion of the hearth toward the periphery thereof, and a rotatable head disposed adjacent the center of the hearth for projecting atomized fuel and air directly into the converging portion of said passageway.

2,099,093

ROOF COMPOSITION AND METHOD OF PRODUCING THE SAME

Henry C. Avery, New Brunswick, N. J., assignor, by mesne assignments, to The Patent and Licensing Corporation, New York, N. Y., a corporation of Massachusetts

Application March 28, 1932, Serial No. 601,702
Renewed June 25, 1935
4 Claims. (Cl. 91—70)



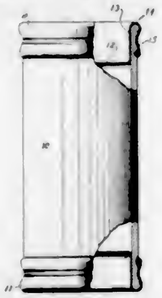
1. The method of making roofing of the character described which comprises coating a roofing base with molten bituminous waterproofing material having a relatively high melting point, applying to the coated sheet a secondary coating of bituminous waterproofing material of relatively low melting point dispersed in an aqueous medium, while the first named coating is at an elevated temperature whereby to effect a heat interchange between said coatings, and permitting the secondary coating to dry and become united with the first named coating.

2,099,094

ROOFING

Henry C. Avery, New Brunswick, N. J., assignor to The Patent and Licensing Corporation, New York, N. Y., a corporation of Massachusetts

Original application March 28, 1932, Serial No. 601,702. Divided and this application May 9, 1934, Serial No. 724,721
1 Claim. (Cl. 91—68)



Roofing of the character described comprising a suitable foundation having on the surface exposed to weather a composite layer of waterproofing material, said layer having an inner stratum of waterproof material and an overlying layer of coalesced asphalt united integrally with the first named asphalt, said overlying layer being resistant to flow at temperatures in excess of the melting point of the first named asphalt therein, and grit interlocked by both layers of asphalt.

2,099,095

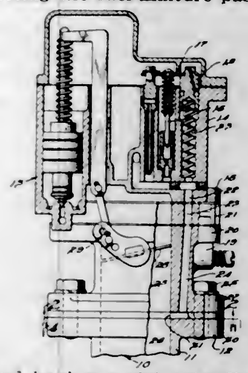
CONTAINER CONSTRUCTION

H. Chester Aument, Long Island City, N. Y.

Application April 13, 1935, Serial No. 16,131
2 Claims. (Cl. 229—5.5)

1. An end seal for a container presenting in section an end wall and a generally U-shaped channel portion projecting from the edges of said wall and perpendicular with respect to the same, said portion in section including an inner plane arm to lie in flat face-to-face contact with the wall of a container with the edge of said wall lying within the crotch of such portion, the outer arm of said portion being of a height less than the inner arm and presenting a plurality of inwardly and outwardly curved surfaces to lie in intimate contact with the outer face of said container body.

2,099,096



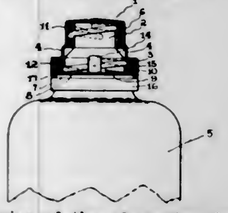
INTERNAL COMBUSTION ENGINE FUEL SYSTEM

Thomas M. Ball, Detroit, Mich.

Application October 12, 1936, Serial No. 105,234
8 Claims. (Cl. 261—1)

1. In an internal combustion engine fuel system comprising a fuel mixture inlet branch, a carburetor including a throttle valve, and a governor body insertable between said carburetor and said inlet branch and including a governor valve,

said carburetor and governor body having registerable fuel mixture passage sections and registerable suction passage sections for establishing communication between the fuel mixture passage of said system and suction operative parts of said carburetor, means for alternatively connecting said carburetor directly to said inlet branch and indirectly thereto through said governor body respectively comprising flanges on said inlet branch, carburetor and governor body, and a pair of gaskets, one insertable directly between said carburetor and said inlet branch having an opening for connecting the fuel mixture passage sections



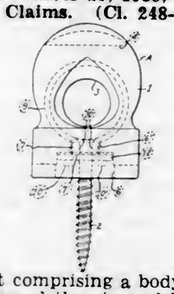
thereof and having a slot extending from said opening and registerable with the suction passage section of said carburetor for connecting the same to the fuel mixture passage of said system at the junction of said carburetor and inlet branch, the other gasket having an opening for connecting the fuel mixture passage sections of said inlet branch and governor body when the latter is employed and having a port registerable with the suction passage sections of said governor body and carburetor for connecting the same to the fuel mixture passage of said system on the suction side of said governor valve.

2,099,097

MEANS FOR SEALING CONTAINERS

Warren H. Belder and Thomas M. Cunningham, Passaic, N. J.

Application October 24, 1935, Serial No. 46,514
3 Claims. (Cl. 215—7)



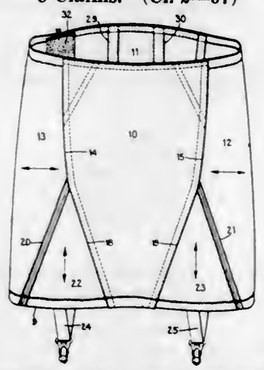
2. In a device of the character described, the combination of a container, a longitudinal groove in the wall of the said container and a shoulder on the said container, a threaded cap on the said container and having a marginal rim seated on the said shoulder, said cap comprising a top section and a collar section and a frangible web between the said sections, means for locking the said cap against reverse rotation, said locking means comprising an annular plate having an internally disposed lug seated in the said groove in the wall of the container and a spring tongue engaging the collar section of the said cap, and a plate in the said marginal rim of the cap protecting the said locking means.

2,099,098

BRACKET FOR ELECTRICAL WIRES

William J. Binkley, Warrenton, Mo., assignor to James R. Kearney Corporation, St. Louis, Mo., a corporation of Missouri

Application November 29, 1935, Serial No. 52,137
5 Claims. (Cl. 248—71)

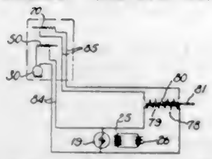


1. A bracket comprising a body portion having an opening formed therein and having a portion surrounding said opening, an element for securing said body portion to a support, said element being provided with a shoulder, and means for attaching said securing element to said body portion, said means comprising an annular member provided with substantially parallel end portions movable from each other to spread the annular member, said annular member being arranged in embracing relation with respect to the portion of said body portion that surrounds the opening therein, and means for connecting said end portions of said annular member to said securing element, said means comprising a member arranged in contact with the shoulder of said securing element through which member portions of said annular member extend and with respect to which the end portions of said annular member are bent, said member being disposed within said body portion.

2,099,099

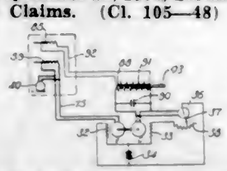
APPAREL GARMENT

Raymond W. Bissell, Milford, Conn., assignor to The Strouse Adler Company, New Haven, Conn., a corporation of Connecticut



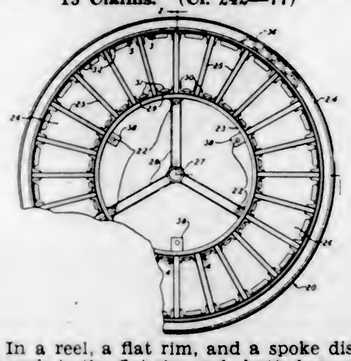
Application April 25, 1936, Serial No. 76,315
8 Claims. (Cl. 2—37)

1. A garment of the class described having in its back portion material substantially nonelastic in at least the vertical direction extending



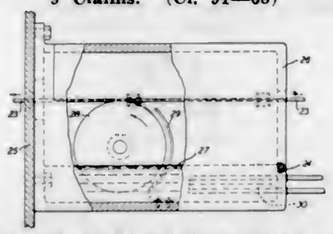
from the lower edge of the garment upwardly at both sides of the centerline of the back to restrain posterior portions of the wearer and the side boundaries of which material, at at least its lower part, extend downwardly and toward the centerline of the back of the garment, and also having in its back portion, at each side of said vertically-non-elastic material, material that is elastic in at least the vertical direction and that is connected to the adjacent boundary of said substantially non-elastic material, at least at the lower part of the latter, so that vertically-elastic material is located between said substantially non-elastic material and the lower edge of the garment.

2,099,100
VALVE CUT-OFF INDICATOR FOR LOCOMOTIVES
Alexander R. Bond, Plainfield, N. J., assignor to William Bell Wait, New York, N. Y.
Application April 9, 1934, Serial No. 719,661
7 Claims. (Cl. 105—48)



1. The combination with the operating gear for the cut-off valve of a locomotive, of an electric generator driven by a track wheel of the locomotive and adapted to generate alternating current varying in potential in proportion to the speed of the locomotive, a movable needle, a solenoid adapted to move the needle, a transformer, electrical conductors connecting the generator and the primary coil of the transformer for energing said coil, electrical conductors connecting the secondary coil of the transformer and the solenoid for energizing the latter, a movable core in the transformer, and means for moving the core in accordance with the cut-off setting so as to vary the current in the secondary and hence the position of the solenoid thereby bringing the needle to a zero position at any speed of the locomotive when the cut-off is adjusted for maximum draw bar pull at such speed.

2,099,101
SPEED AND CUT-OFF INDICATOR FOR LOCOMOTIVES
Anthony J. Porskievies, Atlantic Highlands, N. J., assignor to William Bell Wait, New York, N. Y.
Application September 28, 1934, Serial No. 745,863
6 Claims. (Cl. 105—48)

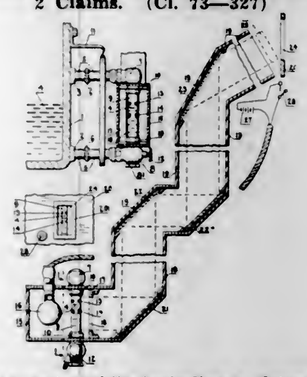


1. The combination with the operating gear for the cut-off valve of a locomotive, of an alternating current generator driven by a track wheel of the locomotive, means constructed and arranged to maintain such current at substantially constant potential, a movable hand, a solenoid adapted to move the hand, a transformer, electrical conductors connecting the generator and the primary coil of the transformer for energizing said coil, separate electrical conductors connecting the secondary coil of the transformer and the solenoid for energizing the latter, a movable core in the transformer for varying the inductive linkage between the primary and the secondary, and means for moving the core in predetermined relation to the instant setting of said gear to control the pull of the solenoid and thereby control the position of the hand correspondingly.

2,099,102
REEL
Alfred B. Brown, Essex Fells, and Claude T. Siebs, Fanwood, N. J., assignors to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application October 11, 1933, Serial No. 693,060
15 Claims. (Cl. 242—77)

11. In a reel, a flat rim, and a spoke disposed at an angle to the flat rim and abutted at one end thereof against the rim and formed with integral projections disposed at an angle to the spoke and secured directly to the flat inner face of the rim.

2,099,103
METHOD OF COATING ARTICLES
Thomas King Cox, Baltimore, Md., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application July 12, 1934, Serial No. 734,711
9 Claims. (Cl. 91—68)



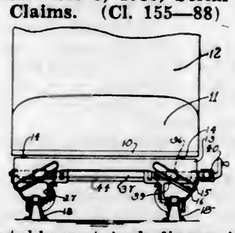
3. The method of insulating an electrical conductor with an insulating material, which includes depositing upon the conductor a film of a mixture of an ingredient tending to resist adhesion between said conductor and said insulating material, said ingredient being selected from a group consisting of oils and paraffin waxes, and another ingredient tending to promote adhesion between said conductor and said insulating material, said second named ingredient being selected from a group consisting of formic, acetic, oleic and palmitic acids, said adhesion resisting ingredient being capable of forming a solution or an emulsion with said adhesion promoting ingredient, and thereafter forming on said conductor and film a coating of an insulating material, the proportions of the adhesion resisting and adhesion promoting ingredients being relatively variable to vary the degree of tenacity of adhesion between the conductor and the insulating material.

2,099,104
PRINTING AND DYEING COMPOSITIONS
Miles Augustinus Dahlen, Wilmington, and Frithjof Zwilgmeyer, Arden, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application October 10, 1935, Serial No. 44,328
10 Claims. (Cl. 8—5)

1. A textile material dyed with a color formed by coupling thereon a compound from the class consisting of $(NH_2)_X$—Aryl, $(HO)_Y$—Aryl, $(NH_2)_X$—Aryl—$(OH)_Y$, in which X and Y are each 1, 2 or 3, with a diazotized primary arylamine free from water-solubilizing groups.

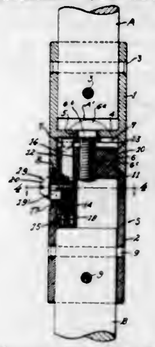
2,099,105
INSTRUMENT PANEL OIL LEVEL INDICATOR
Frederick William Dippel, Milwaukee, Wis.
Application January 10, 1936, Serial No. 58,546
2 Claims. (Cl. 73—327)

1. In an automobile including a driver's position, an engine having an oil reservoir, and an apertured partition between the engine and the driver's position, an oil gauge and periscope unit supported from and secured in its entirety to the engine, said unit being movable with the engine when the engine moves relative to said apertured partition, said unit including an oil gauge in connection with said reservoir and visible at the engine, and a periscope comprising a tubular casing having its lower end in communication with said gauge and extending substantially upwardly therefrom, said casing having its upper end positioned so that the gauge may be viewed through the aperture in said partition and with the upper end movable relative to said apertured partition.



2,099,106
CARBURETOR SPRING
William M. Ewart, St. Louis, Mo., assignor to Carter Carburetor Corporation, St. Louis, Mo., a corporation of Delaware
Application May 9, 1934, Serial No. 724,741
1 Claim. (Cl. 267—1)

A spring element for a carburetor metering pin comprising an intermediate coiled portion having at one end an elongated arm with a pliable extremity extending therefrom and medially across the adjacent coiled portion and another



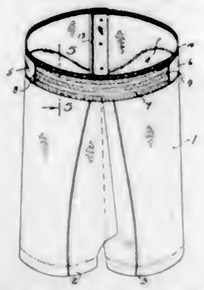
arm extending from the opposite end of said coil, the axis of the later arm being tangential of the coil and terminating in a hooked portion.

2,099,107
ADJUSTABLE SEAT
Alexander M. Fleming, Detroit, Mich., assignor to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware
Application December 5, 1935, Serial No. 52,946
5 Claims. (Cl. 155—88)

1. An adjustable seat including a base structure, a pair of longitudinally spaced channel members on the front and rear edge portions of said seat respectively, each of said channel members including a pair of downwardly extending flanges having registering inwardly inclined slots therein, a nut member disposed between the flanges of each channel member and having projections extending into the slots thereof, a shaft journaled in said base structure and in threaded engagement with the nuts at the edge portions of said seat respectively, and means rotating each of said shafts for independently varying the elevation of the front and rear portions of said seat.

2,099,108
POLE SPLICE
Charles Adin Fox, St. Louis, Mo., assignor to James R. Kearney Corporation, St. Louis, Mo., a corporation of Missouri
Application August 7, 1935, Serial No. 35,085
2 Claims. (Cl. 287—125)

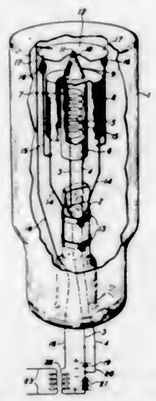
1. A splice for connecting a pair of pole sections comprising a pair of members fixed to said pole sections, a screwthreaded element carried by one of said members, said screwthreaded element



being provided with an enlarged head portion which is confined between a part of the member with which said screwthreaded element is associated and an end face of the associated pole section whereby longitudinal movement of said screwthreaded element is prevented, means for preventing rotary movement of said screwthreaded element with respect to the member with which said screwthreaded element is associated, said screwthreaded element being screwthreadedly received by a screwthreaded opening formed in the other of said members so as to connect said pair of members and the associated pole sections together, and releasable means carried by one of said members and engageable with the other of said members to prevent unintended relative rotary movement of said members in the unscrewing direction.

2,099,109
PROCESS OF OBTAINING PARA-CRESOL FROM TAR ACID MIXTURES
David F. Gould, Riverton, N. J., assignor to The Barrett Company, New York, N. Y., a corporation of New Jersey
No Drawing. Application November 5, 1935, Serial No. 48,338
11 Claims. (Cl. 260—154)

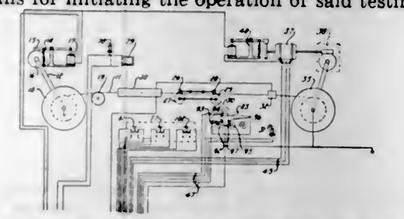
1. A process of purifying para-cresol-oxalic-acid addition compound contaminated with tar acids other than para-cresol, which comprises slurrying said impure addition compound with a non-aqueous solvent for said other tar acids at an elevated temperature such that substantial dissociation of the addition compound takes place, cooling the heated mixture and separating purified crystalline para-cresol-oxalic-acid addition compound therefrom.



11. The method for obtaining para-cresol from crude para-meta-cresol mixtures, which comprises forming a para-cresol-oxalic-acid addition compound with said para-cresol, washing said compound with xylene, slurrying said compound with about twice its weight of xylene at a temperature of about 70° C., cooling said slurry to not less than 15° C. to reform the para-cresol-oxalic-acid addition compound while agitating it, and recovering para-cresol from the para-cresol-oxalic-acid addition compound thus reformed.

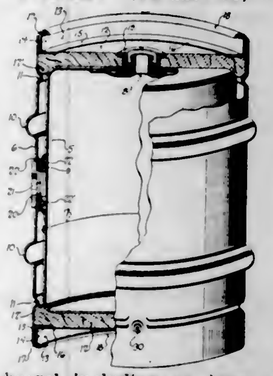
2,099,110
UNDERGARMENT AND THE LIKE
Vernor E. Green, Little Falls, N. Y., assignor to Little Falls Manufacturing Company, Inc., Little Falls, N. Y., a corporation of New York
Application October 22, 1935, Serial No. 46,063
1 Claim. (Cl. 2—237)

A garment of the class described comprising a body portion of knitted material having wales extending vertically and adapted to cover the lower body portion and crotch of the wearer, a double walled waist band, the walls of which are stitched to each other throughout the upper and lower edges thereof, the front section of said waist band comprising superimposed plies of knitted material, one ply having its wales extending vertically, the other ply adjacent the front of the garment having its wales extending horizontally whereby to confine the said first named ply and to render the front section of the waist band inextensible, the back of the waist band comprising a horizontally extensible ply of knitted material and an elastic member superimposed thereon, said elastic member being secured at its ends to the inextensible front section, whereby to provide a back section, the outer wall of which is elastic and the inner wall extensible, the elastic member being at least as long when contracted as the portion of the inner wall on which it is superimposed thereby to provide a smooth and unwrinkled inner wall.



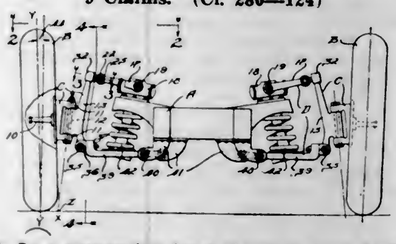
2,099,111
GASEOUS DISCHARGE DEVICE
John R. Hefele, Brooklyn, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application March 9, 1935, Serial No. 10,239
10 Claims. (Cl. 176—124)

1. A gaseous discharge device comprising electrodes determining a discharge path between said electrodes, a discharge directing member between said electrodes, means for heating one of said electrodes to electron emission temperature, and means for supplying to said heating means constant current, one terminal of said heating means being connected to the heated electrode and the other terminal being positively polarized with respect thereto.



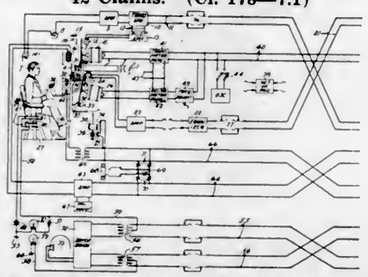
2,099,112
APPARATUS FOR TESTING INSULATION
Walter M. Hill, Randallstown, Md., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application October 29, 1931, Serial No. 571,811
Renewed January 26, 1937
8 Claims. (Cl. 175—183)

2. In a testing apparatus, electrically operated power means for passing an insulated conductor through the apparatus, electrical means for testing the insulation of said conductor as it passes through the apparatus, and electrically operated means for initiating the operation of said testing



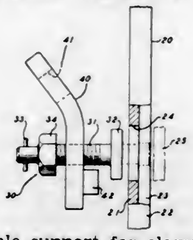
means and subsequently and automatically initiating the operation of said power means.

2,099,113
BARREL
Theodore C. Hollnagel, Milwaukee, Wis.
Application June 29, 1934, Serial No. 733,014
3 Claims. (Cl. 220—10)



1. In a barrel including an inner container and an outer protecting shell, a removable head for the shell engaging the container and holding the same against shifting with respect to the shell, means to removably secure the head in the shell comprising, an inwardly directed flange on the end of the shell, a contractible hoop confined between said flange and the adjacent portion of the head, said flange having a rim on its inner portion past which the contractible hoop snaps during application and by which the hoop is held against accidental contraction.

2,099,114
VEHICLE WHEEL SUSPENSION
John R. Holmes, Highland Park, Mich., assignor to Chrysler Corporation, Detroit, Mich., a corporation of Delaware
Application July 12, 1934, Serial No. 734,720
9 Claims. (Cl. 280—124)



1. In a suspension for a steering ground wheel of a motor vehicle having a frame structure, wheel supporting means including a substantially vertically extending arm, upper and lower linkages intermediate said frame structure and said arm, an adjustable connector between said arm and one of said linkages, said connector having a threaded stem supported by the last said linkage, and a nut threaded on said stem adapted to adjust said stem laterally of the vehicle to vary the wheel camber.

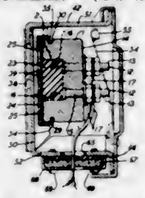
2,099,115
COMMUNICATION SYSTEM
Herbert E. Ives, Montclair, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application April 8, 1930, Serial No. 442,503
Renewed June 5, 1936
42 Claims. (Cl. 178—7.1)

1. A terminal apparatus for two-way television comprising fixed transmitting means for scanning an observer, means for producing an image of a distant person in a predetermined position with respect to said observer, and means, comprising a support to be occupied by said observer and a barrier in front of and above said support, for limiting the movement of said observer to maintain him in a position where he may be scanned by said transmitting means and simultaneously see an image of the distant person.

2,099,116
CLAMP
Lloyd R. Kalmbach, West Englewood, N. J., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application May 7, 1936, Serial No. 78,413
2 Claims. (Cl. 294—67)

1. A detachable support for clamping attachment to an object having an elongated slot, the said support comprising a member having an elongated overhanging head formed to pass through the slot from one side of the object when in one position relative to the slot and not when rotated into another position, a support member movably mounted on the body of the first member and provided with a lug formed to enter the slot from the same side of the object only beside

the body of the first member and to stand beside the head of the first member when in the second position of the head to prevent the first member from rotating from its second position and to prevent the support member from rotating, means formed integrally on the support member whereby the same and therewith both the first member and the object may be supported, and adjustable means to force the support member to move on the first member toward the head of the first member to clamp the object between the head and the support member.



2,099,117

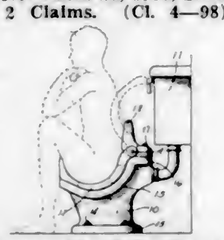
TERMINAL MOUNTING

Le Roy W. Kelsay, Summitt, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application November 13, 1936, Serial No. 110,647

4 Claims. (Cl. 247—7)

1. A terminal mounting comprising, in combination, a block of insulating material, a recessed portion in said block, spaced terminals supported in said block, end portions of said terminals extending into said recessed portion, insulating compound filling said recessed portion and surrounding said end portions of said terminals, a strip of metal foil covering said recessed portion and adhering to said insulating compound, a cushion of compressible material covering said strip of metal foil, and a plate of metal covering said cushion and engaging said block of insulating material to clamp said cushion against said strip of metal foil.



2,099,118

TOILET ASSEMBLY

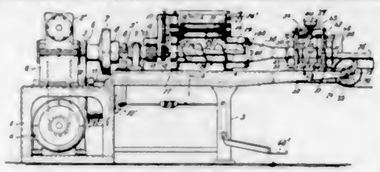
George Winter Kennedy, Philadelphia, Pa.

Application November 28, 1936, Serial No. 113,148

2 Claims. (Cl. 4—98)

1. A toilet assembly of the character described comprising a toilet bowl formed with an upper edge curved from the front to the rear, a toilet seat conforming in curvature to the upper edge of the bowl, and a back member carried by the bowl.

2,099,119



YEAST MOLDING AND CUTTING MACHINE

Harold L. King, Glen Ridge, Albert Sharp, Bayonne, and Karl Schnorr, Belleville, N. J.

Application March 14, 1935, Serial No. 11,018

11 Claims. (Cl. 107—20)

1. A plastic-handling machine, comprising means for receiving loose plastic, means for conveying and compressing same, means for dividing the compressed plastic, and means independent of

the movement of the plastic but cognate with the dividing means for automatically stopping the conveying-means before dividing the plastic.

2,099,120

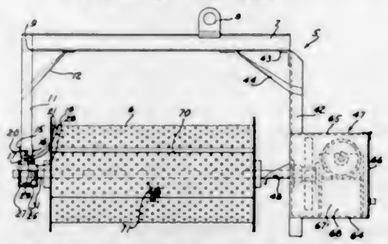
FLOTATION PROCESS

James Emory Kirby and James Herbert Werntz, Wilmington, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application October 15, 1936, Serial No. 105,676

10 Claims. (Cl. 209—166)

1. In the froth flotation process of treating ores, the step which comprises utilizing as a flotation agent a water-soluble salt of an organic dicarboxylic acid having one carboxyl group esterified by an alcohol selected from the group consisting of long chain primary aliphatic alcohols having from eight to eighteen carbon atoms and alicyclic alcohols formed in the carboxylic reduction of a naphthenic acid or a natural resin acid.



2,099,121

MATERIAL HANDLING APPARATUS

Ray C. Kivley, Oak Park, Ill., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York

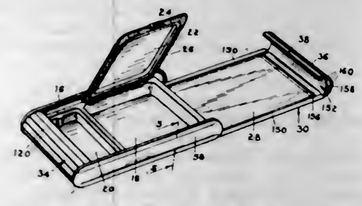
Application September 19, 1936, Serial No. 101,587

9 Claims. (Cl. 266—7)

1. A material handling apparatus, comprising a framework provided with an eye adapted to receive a crane hook whereby it is transportable, a barrel rotatable in said framework, and a driving mechanism mounted upon said framework, said framework having a pair of members fixed thereto and a member pivoted thereon to a limited extent for supporting the framework on the sides of vats to hold the barrel in treating baths in the vats.

2,099,122

ROLL TOP CONTAINER



Jacques Kreisler, New Rochelle, N. Y.

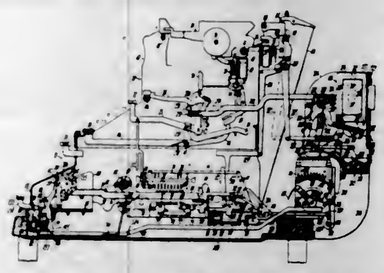
Application August 16, 1935, Serial No. 36,451

24 Claims. (Cl. 132—83)

1. A container having a bottom, a top, and opposed spaced side walls curved at their ends, said side walls having grooves extending along

the top of the container and said end and bottom thereof, and a closure having a flexible portion guided for movement in said grooves and a rigid portion also guided for movement in said

grooves connected to said flexible portion extending along said bottom and arranged to travel with said flexible portion while the latter moves to open and closed positions.



2,099,123

COMBINED TYPEWRITING AND COMPUTING MACHINE

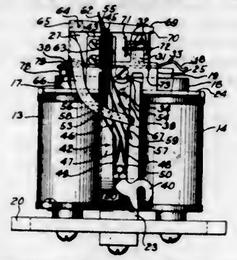
Alfred G. F. Kurowski, Brooklyn, N. Y., assignor to Underwood Elliott Fisher Company, New York, N. Y., a corporation of Delaware

Original application March 15, 1933, Serial No. 660,830. Divided and this application January 27, 1937, Serial No. 122,496

3 Claims. (Cl. 197—13)

1. In a typing machine having a set of types and a letter-feeding carriage, the combination of a set of power-driven actuators for operating said types consecutively in predetermined order in correlation to the carriage-steps, and means, cooperating with said carriage and including an oscillatory weight, for controlling the intervals between the consecutive type-operations, said means and weight being arranged so that said intervals depend on and therefore coincide with the natural period of oscillation of said weight.

2,099,124



COIN COLLECTOR APPARATUS FOR USE AT TELEPHONE PAY STATIONS

Morton L. Landreth, Elmhurst, Ill., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York

Application January 9, 1936, Serial No. 58,315

6 Claims. (Cl. 194—16)

1. In an electromagnetic device, operating windings, an armature having a normal position and operative positions on opposite sides of said normal position, means for holding said armature in normal position comprising a pair of leaf springs and an abutment carried by the armature and extending between said springs, a fixed bifurcated strip between said springs serving to stop them in normal position, and spring contacts arranged to be closed respectively by

said first mentioned springs when they are flexed away from said bifurcated strip.

2,099,125

PIPE CLIP

Esther A. S. Langslow, New York, N. Y.

Application September 26, 1936, Serial No. 102,781

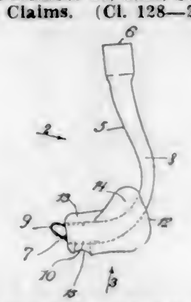
2 Claims. (Cl. 131—12)

1. As an article of manufacture, a pipe supporting stand of the type in which a pipe may be freely inserted and removed, and held by friction holding members, and characterized in that the pipe may be held with the stem extending vertically upward, horizontally, or at any desired intermediate angle; comprising a base, upwardly extending resilient holding members, positioned to correspond with the opposite sides of the bowl of a pipe, that may be inserted therebetween, and knob shaped members on the said upwardly extending members, and mounted therein, and further characterized in that said knob shaped members, being adapted to yield, move outward around the bulging portion of the bowl of a pipe, and inward as the bowl is moved downward on the stand, fitting snugly over the relatively smaller upper portion of either the side or top of the bowl, resiliently holding said bowl against the base in substantially any position, said knob shaped members being arranged in pairs and rotatable, and providing relatively snug holding means to prevent slippage of the bowl, with the pipe in any position, each pair of said knob shaped members being mounted by pins at the upper ends of said upwardly extending holding members.

2,099,126

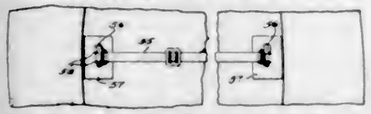
METHOD OF FORMING TUBES

Gabriel Larsen, Springfield, N. J., assignor to L. E. Waterman Company, New York, N. Y., a corporation of New York



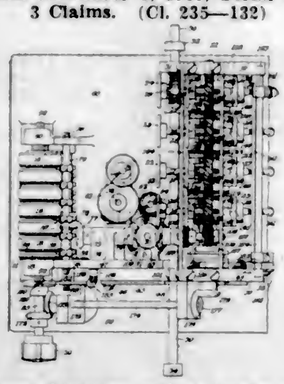
Application April 27, 1935, Serial No. 18,701

3 Claims. (Cl. 41—35)



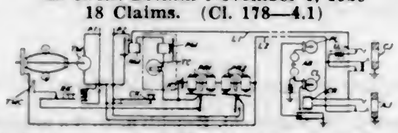
1. The method which comprises forming two tubes of contrasting appearance and of substantially equal diameter, cross-section and wall thickness, forming recesses in the wall of one of said tubes and correspondingly located and substantially identically shaped recesses in the wall of the other tube, and securing in the recesses in one tube the material removed from the other tube in forming the recesses therein.

2,099,127
PHARYNGEAL BULB GASWAY
Beverley C. Leech, Regina, Saskatchewan, Canada, assignor to The Foregger Co., Inc., a corporation of New York
Application December 30, 1936, Serial No. 118,213
6 Claims. (Cl. 128—208)



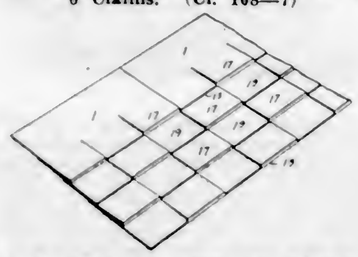
1. As an article of manufacture a curved pharyngeal airway tube, a bulb of resilient material secured to the tube at its lower end, said bulb having the contour of an average adult pharynx, said tube having two metal loops extending forwardly from its lower end.

2,099,128
HAT FASTENER
Sarah Lipton, New York, N. Y., assignor to Ruby Lipton, New York, N. Y.
Application March 31, 1936, Serial No. 71,828
6 Claims. (Cl. 132—58)



1. A chin strap for hats comprising a chin band, fabric tabs at the opposite ends of the bands, each having a plurality of eyes therein, and safety pins attached to the ends of the band and detachably connecting the band to the tabs through the eyes, the arrangement being such that the tabs may be stitched to the hat to form connectors for detachably mounting the band.

2,099,129
FLUID DISPENSING APPARATUS
Carlton L. McMullen, Llanerch, Pa.
Application November 5, 1935, Serial No. 48,275
3 Claims. (Cl. 235—132)

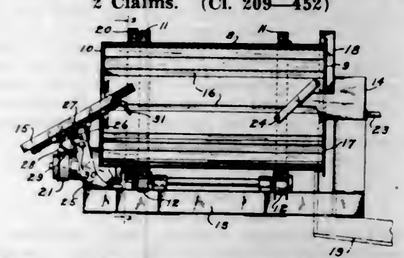


1. The combination with a shaft; of adjustable tripping mechanism for predetermining a number of revolutions of said shaft, including a manually rotary member which must be moved axially to free it for rotational movement to set it with reference to a series of numerals, detent means for temporarily detaining said manually rotary member in any selected position in which it is set, and means for automatically releasing said manually rotary member and permitting it to move axially toward its original position after the predetermined number of revolutions of said shaft.

2,099,130
PRINTING TELEGRAPH MANUAL EXCHANGE SYSTEM
Eric Malcolm Swift McWhirter and James George Flint, Aldwych, London, England, assignors to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application October 25, 1930, Serial No. 491,114
In Great Britain November 6, 1929
18 Claims. (Cl. 178—4.1)

1. In a motor controlling arrangement, a motor, a line connected to a distant source of current, means including a source of power and a circuit changing device responsive to a flow of current in said line for starting said motor, a condenser for obstructing current in said line, and remote control means for short-circuiting said condenser.

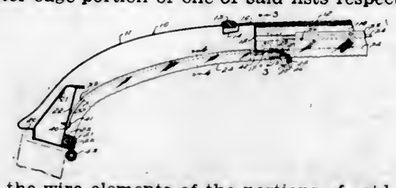
2,099,131
THICK BUTT SHINGLE
Stuart P. Miller, Scarsdale, N. Y., assignor to The Barrett Company, New York, N. Y., a corporation of New Jersey
Application February 27, 1934, Serial No. 713,093
6 Claims. (Cl. 108—7)



5. A light weight thickened butt shingle comprising a flexible fibrous base having a coating of light weight bituminous mastic material thereon, said mastic coating imparting a thick butt appearance to a portion of the exposed butt edge of said shingle, another portion of said exposed butt edge being relatively thin, both said thick and thin butt edge portions being relatively wide to simulate the butt edges of relatively thick and relatively thin shingles respectively as distinguished from spaces between shingles.

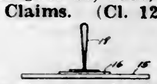
2,099,132
PROCESS OF MAKING CLUTCH FACINGS, BRAKE LININGS, AND LIKE PRODUCTS
Stuart Parmelee Miller, Scarsdale, N. Y., assignor to The Barrett Company, New York, N. Y., a corporation of New Jersey
No Drawing. Application March 24, 1936, Serial No. 70,715
1 Claim. (Cl. 91—70)

A process of making clutch facings, brake linings and like products, from porous heat-resistant material, capable of providing the body and strength necessary to resist abrasion and heat deterioration under conditions to which said products may be subjected in use, which comprises saturating the said porous heat-resistant material under vacuum with a heat decomposable bituminous saturant containing substantially more than 10% free carbon to uniformly impregnate said material and substantially completely fill the pores therein with the free carbon substantially uniformly distributed in said pores, and then baking the impregnated material at a temperature and for a period of time sufficient to cause partial decomposition of the saturant to produce a hard, coke-like, substance filling the pores of said material, whereby a hard, dense, product containing from 26 to 28% by weight of such coke-like substance and resistant to abrasion and heat deterioration results.



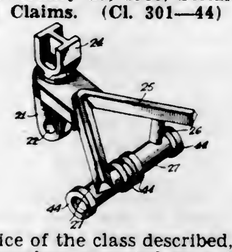
2,099,133
GRANULAR MATERIAL WASHER
Alexander L. Munro and Harvey H. Rumpel, Milwaukee, Wis., assignors to Smith Engineering Works, Milwaukee, Wis., a corporation of Wisconsin
Application January 4, 1935, Serial No. 334
2 Claims. (Cl. 209—452)

1. In combination, a rotary drum having internal flights for precipitating admitted material across the drum axis, feed means for delivering mixed fine and coarse granular material through an axial opening into one end of said drum, means for delivering liquid along the bottom of said feed means and through said opening, an inclined plate disposed within said drum and extending downwardly away from a point above said opening to conduct material precipitated thereon by said flights away from the feed end of said drum, means for effecting delivery of fine material directly from the peripheral portion of the feed end of said drum, an inclined discharge chute adjustable longitudinally of the drum axis and extending into the opposite end of said drum, the space within said drum between said plate and chute being devoid of obstruction, and means for producing a flow of liquid from beneath said chute toward the feed end of said drum and through the mixed material delivered from said feed means.



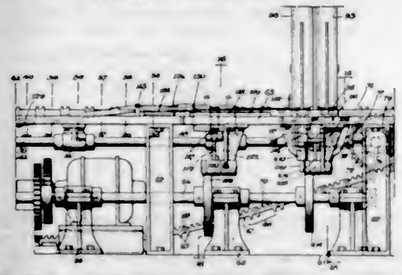
2,099,134
VEHICLE BODY CONSTRUCTION
Harry H. Nissley, Highland Park, and Gabriel M. Mazzie, Detroit, Mich., assignors to Chrysler Corporation, Detroit, Mich., a corporation of Delaware
Application January 21, 1935, Serial No. 2,654
3 Claims. (Cl. 296—137)

1. In a vehicle comprising a roof structure having transversely arched side marginal portions and having a relatively flatter central portion, a substantially assembled head lining portion and mounting structure therefor including a piece of sheet lining material, transversely extending lists spaced longitudinally of said lining material having edge portions fixed to the exterior side thereof, portions of lists having arched edge portions, means for securing said lists to said roof structure including wire elements, each fixed to the outer edge portion of one of said lists respective-



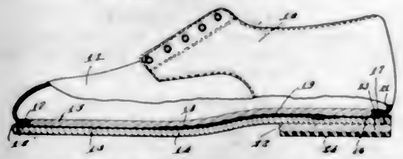
ly, the wire elements of the portions of said lists which register with the arched portions of said roof structure being bowed to correspond with the curvature thereof, substantially rigid members fixed to said lining material and extending along the longitudinal edges of the flat portion of said roof structure and secured thereto, and means for tensioning said lining material between said members comprising a flexible strip initially assembled with said lining material.

2,099,135
ADVERTISING BLOTTING DEVICE
Eugene F. O'Neill, St. Paul, Minn., assignor of fifty per cent to Frank M. Skaj, St. Paul, Minn.
Application August 29, 1935, Serial No. 38,415
4 Claims. (Cl. 120—24)



1. A blotting structure having in combination, a blotter of sheet material, a second sheet of material secured to the top surface of said blotter and folded into a narrow loop upstanding from said blotter, a member of resilient material disposed in said loop and secured to said blotter whereby said loop may be bent over substantially into the plane of said blotter and will be returned to its vertical position by said member.

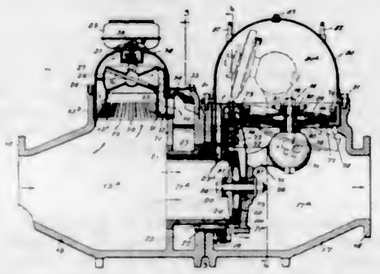
2,099,136
TRACTION WHEEL
Karl Johan Engelbert Nilson, Schenectady, N. Y.
Application February 19, 1936, Serial No. 64,664
2 Claims. (Cl. 301—44)



1. In a device of the class described, a traction wheel, shoe members mounted upon the edge of the latter and comprising a bifurcated body portion, a sharp-edged block member opposite said bifurcated portion and threaded into the latter, a V-shaped tapered section integral with said bifurcated portion, short rods depending from and integral with said V-shaped portion, and short cylindrical tubes integrally secured at the lower ends of said rods and adapted for attachment to the peripheral edge of said wheel.

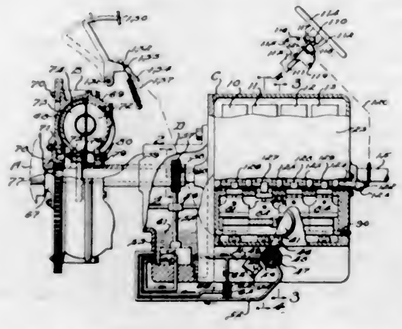
2,099,137
MACHINE FOR MAKING MATCH PACKETS
John R. Nolan, Larchmont, N. Y., assignor to The Diamond Match Company, Wilmington, Del., a corporation of Delaware
Application August 12, 1936, Serial No. 95,534
21 Claims. (Cl. 93—2)

1. The combination with juxtaposed cover and match conveyers each comprising a succession of supporting members, means for imposing cover strips of flexible material on and transversely of the supporting members of the cover conveyer, means for bending at least one end portion of each cover strip to provide a resilient end fold arranged and adapted to be drawn against match stems protruding from a matchholder borne by the cover conveyer, means for applying match holders to the bodies of the respective cover strips imposed on the cover conveyer, means for inserting in the respective holders rows of matches supported by the adjacent members of the match conveyer so that the stem ends of the matches protrude beyond the holders, means for folding the cover strips upon the proximate holders and with the resilient end folds of the strips positioned across the protruding match stems, and means for pinching and fastening the ends of said resilient folds to the walls of the respective covers.



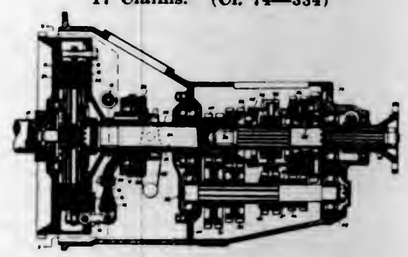
2,099,138
SHOE
Burt F. Norcross, Dorchester, Mass.
Application January 10, 1936, Serial No. 58,480
1 Claim. (Cl. 36—17)

An improved shoe comprising in combination, an upper, a counter, a welt stitched to said upper and counter, a heel member and outer sole member, said outer sole member being stitched to said welt, said heel member being attached to said outer sole member by means of nails driven from the inside of said shoe through the said counter, upper, and welt member and terminating in said outer sole and heel member.



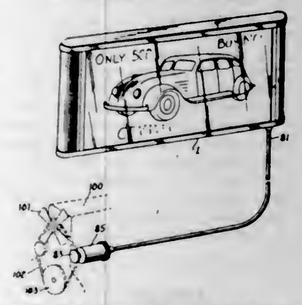
2,099,139
WATER METER
Edward Nuebling, New York, N. Y.
Application March 22, 1935, Serial No. 12,372
3 Claims. (Cl. 73—203)

1. In a water meter, the combination of a casing provided with connected inlet and outlet chambers constituting an internal main line channel, movable valve means for controlling the flow through said main line channel, by-pass means leading from said inlet chamber to said outlet chamber, a measuring chamber in said by-pass means, operating means in said measuring chamber actuated by the flow therethrough, a rotatable friction disc operated by said operating means, a totalizer including a friction wheel operated by said friction disc to register the flow



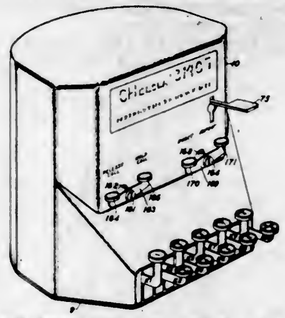
through said by-pass means, a second movable totalizer including a second friction wheel in engagement with said friction disc, and means controlled by the movements of said valve means to adjust said second totalizer and shift said second friction wheel relatively to said friction disc in accordance with the position of said valve means whereby said second totalizer co-operates with said first totalizer to register the total flow through said meter.

2,099,140
TRANSMISSION
Herbert F. Patterson, Detroit, Mich., assignor to Chrysler Corporation, Detroit, Mich., a corporation of Delaware
Application January 25, 1934, Serial No. 708,234
38 Claims. (Cl. 74—262)



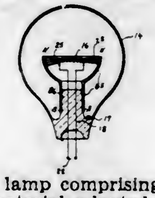
1. In a braking mechanism, a rotatable drum, a plurality of substantially semi-circular bands, shoes respectively associated with said bands for engagement with said drum, one of said shoes being substantially semi-circular and the other being substantially circular, means for anchoring said bands, and means for actuating said bands, said actuating means applying a differential of force to said bands whereby to substantially equalize the braking effort applied to said drum.

2,099,141
PRESELECTIVE CHANGE-SPEED GEARING
Reid Antony Railton, Byfleet, England, and Achille Charles Sampietro, Genoa, Italy, assignors to Robot Gearing Limited, London, England, a company of Great Britain
Application June 28, 1935, Serial No. 28,810
In Great Britain July 5, 1934
17 Claims. (Cl. 74—334)



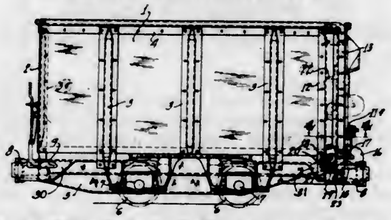
1. A preselective change-speed gearing having two gear-selecting clutches, a clutch-actuating element movable one side and the other of a neutral position to engage said clutches alternatively, two levers movable about parallel axis and so geared together that they are constrained to rock in opposite directions, a gear-changing control member operatively connected with said geared levers, which are disposed one on each side of said clutch-actuating element so as to be capable of moving said element to the neutral position as a result of operation of said control member in one direction, a rocking lever pivotally mounted on said clutch-actuating element and capable of engaging with said geared levers alternatively, so as to couple one or other of said geared levers to said clutch-actuating element, and preselector control means including a cam capable of actuating said rocking lever.

2,099,142
DISPLAY DEVICE AND DRIVE THEREFOR
Charles Roberts, New York, N. Y., assignor to Multiposter Advertising Corporation, New York, N. Y., a corporation of New York
Application November 13, 1936, Serial No. 110,574
17 Claims. (Cl. 40—36)



1. In a display device having a window therefor and comprising an elongated track circuit horizontal to and traversing said window, display holders movably restrained in said track circuit, a motor driven conveyor circuit within said track circuit, and a magazine for said holders composed of that portion of said track circuit embracing both ends thereof and including the side traversing said window filled with compacted display holders.

2,099,143
CALL TRANSMITTER DEVICE
John G. Roberts, Dobbs Ferry, and Charles D. Richard, West New Brighton, N. Y., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application June 20, 1936, Serial No. 86,284
32 Claims. (Cl. 179—90)



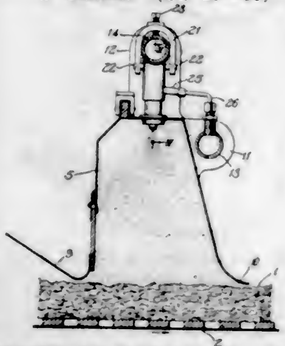
31. A call transmitter in which a set of keys controls an impulse mechanism to transmit a code of impulses according to the keys depressed, characterized in this, that the impulse mechanism is started in operation by the depression of the first digit key, and an auxiliary key is provided which when actuated prior to the digit keys prevents the impulse mechanism from functioning until such key is released.

2,099,144
MAGNETIC DISCHARGE DEVICE
Charles Spaeth, Flushing, N. Y.
Application December 11, 1933, Serial No. 701,843
4 Claims. (Cl. 176—1)

1. An electric lamp comprising, an emitter of ferromagnetic material adapted to emit minute ferromagnetic particles when heated, means for heating the same, and magnetic means for directing said emitted particles.

2,099,145
VEHICLE STRUCTURE
William M. Sheehan, Merion, Pa., assignor to General Steel Castings Corporation, Granite City, Ill., a corporation of Delaware
Application August 14, 1935, Serial No. 36,050
13 Claims. (Cl. 105—364)

1. A vehicle body including an underframe and an upright corner post member having a bearing



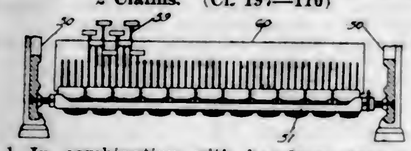
for mounting a vertically movable draft connection and for transmitting longitudinal forces from said connection to the remainder of the vehicle.

2,099,146

CONDITIONING TEXTILE STOCK

Hughes L. Siever, Keyser, W. Va., assignor to Borne Scrymser Company, New York, N. Y., a corporation of New Jersey

Application February 10, 1934, Serial No. 710,647
2 Claims. (Cl. 19—66)



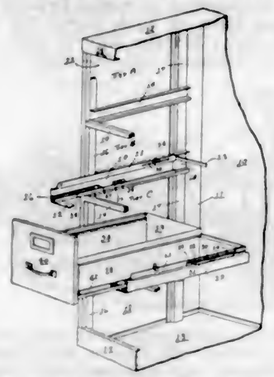
1. Apparatus for applying oil and like conditioning fluid to cotton stock comprising in combination, means for supporting a continuous, moving, flat lap of stock, a hood consisting of a box-like enclosure with an open bottom extending crosswise of the lap, means for supporting such hood over said lap with the edges of its open bottom in close proximity to the top surface of said lap, means for maintaining a low-pressure air dispersion or fog of the oil within the hood, said lap constituting a complete though porous closure to the open bottom of said hood and its proximity to the edges of said open bottom and the pressure condition within the hood being correlated to prevent substantial oil escape to the external atmosphere.

2,099,147

KEY-LEVER-LOCK FOR KEY-LEVER TYPE MACHINES

Lora Evans Tapp, New Albany, Ind., assignor of six and one-fourth per cent to James W. Baxter, Jr., six and one-fourth per cent to David F. Feiock, twelve and one-half per cent to James C. Riely, and twenty-five per cent to Hugh M. McCormick, all of New Albany, Ind.

Application February 4, 1937, Serial No. 124,020
2 Claims. (Cl. 197—110)



1. In combination with key-lever type machines, a key-lever-lock consisting of a line-lock-bar, an alignment-bar connected thereto, a plurality of segments rotatably mounted on said line-lock-bar and provided with tongues projecting to and under said alignment-bar, and a plurality of coiled springs attached to and below said alignment-bar to control and restore position to said segments by means of said segment-tongues.

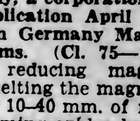
2,099,148

FILING CABINET

Fred W. Tobey, Grand Rapids, Mich.

Application June 20, 1935, Serial No. 27,462
2 Claims. (Cl. 45—77)

2. In a structure of the class described: a cabinet provided with a pair of forwardly-rearwardly extending guides at its opposite sides respectively, each guide having vertically spaced flat track portions extending inwardly, a pair of connected slides extending parallel with and supported on the guides respectively, each slide having a vertical side wall middle portion with a medial bearing and a bearing adjacent its forward end, each slide having also a pair of vertically spaced flat track portions extending inwardly from said middle portion, the lower one of the slides' pair of track portions having a medial opening therethrough and the upper track portion of said pair having an upwardly extending inner side wall having a bearing; a drawer having on its opposite sides respectively forwardly-rearwardly extending flat runners, each having an upwardly extending side wall having a bearing; antifriction rollers comprising a roller between said runner and the lower track portion of the guide extending through said medial opening in the lower track portion of the slide and having an axial spindle rotatable in the medial bearing in the middle side wall portion of said slide, a roller between said runner and the lower track portion of the slide having an axial spindle rotatable in the forward bearing in the slide's middle side wall portion, a roller between the guide's upper track portion and the slide's upper track portion having an axial spindle rotatable in the bearing in the upwardly extending side wall of the slide, and a roller between the slide's upper track portion and said runner having an axial spindle rotatable in the bearing of the side wall of the runner, each of said rollers being laterally spaced from the side walls adjacent its opposite sides and axially movable relatively thereto to permit free forward-rearward movement of the drawer and the slide.



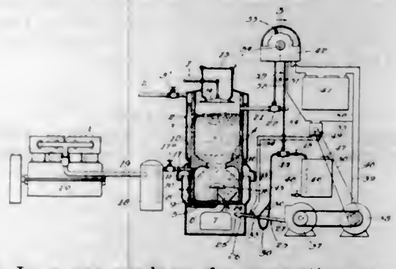
2,099,149

BUILDING BLOCK

Alexander N. Turnquist, Glen Ellyn, Ill.

Application February 10, 1937, Serial No. 125,094
2 Claims. (Cl. 72—25)

1. A slab-like building block consisting of a plurality of superposed layers of material, one layer of which protrudes beyond the adjoining layer continuously for one-half way around the edge of the block, and recedes continuously for the other half way, thereby providing tongue means on half the perimeter and groove means on the other half of the perimeter of the block to interengage with corresponding groove and tongue means on the perimeter of the adjoining blocks



to prevent relative movement in one direction, and flaring means on said blocks including their tongue and groove means to prevent separation thereof in another direction.

2,099,150

APPARATUS FOR PRODUCING GAS

Arthur P. van Heeden, Chicago, Ill., assignor, by mesne assignments, to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

Original application May 31, 1927, Serial No. 195,193, now Patent No. 1,900,141, dated March 7, 1933. Divided and this application January 6, 1932, Serial No. 585,045. Renewed February 13, 1937
4 Claims. (Cl. 48—87)

3. In a gas producer for generating gaseous fuel from solid carbonaceous material, the combination of means including an air blower for introducing air to the producer, fluid fuel supply means discharging into the producer, a valve in the fuel supply means, an ignition device for igniting the fluid fuel issuing from the last-named means, and a manually operable control switch and means associated therewith for actuating said blower, valve and ignition device.

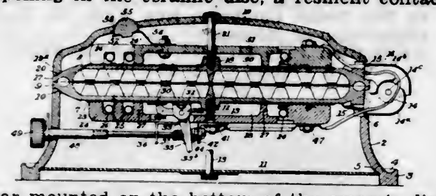
2,099,151

PRODUCTION OF MAGNESIUM FROM MAGNESIUM OXIDES

Adolf Vogt, Tschechnitz, near Breslau, Germany, assignor to Dr. Alexander Wacker Gesellschaft für Elektrochemische Industrie, G. m. b. H., Munich, Germany, a corporation

No Drawing. Application April 3, 1936, Serial No. 72,540. In Germany May 22, 1935
8 Claims. (Cl. 75—10)

1. Process for reducing magnesium oxide which comprises melting the magnesium oxide in a vacuum of about 10–40 mm. of mercury with a reducing agent forming oxides less volatile than magnesium, in the presence of sufficient flux to liquefy the mixture.



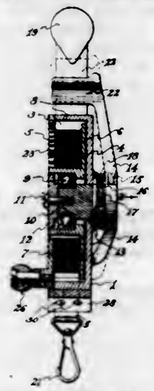
2,099,152

WAFFLE IRON

Emil Walder, Greensburg, Pa., assignor to Porcelier Manufacturing Company, Greensburg, Pa., a corporation of Pennsylvania

Application October 29, 1934, Serial No. 750,420
2 Claims. (Cl. 219—19)

1. A waffle iron or the like comprising a metallic grid member, an electric heater therefor, a ceramic disc under the grid member supporting the electric heater, a thermostatic strip secured to the grid member on the under surface thereof arranged to be affected by the heat of the grid, an elbow lever pivotally supported on the bottom of the grid having an arm engaging said strip, the other arm of said lever passing through an opening in the ceramic disc, a resilient contact



bar mounted on the bottom of the ceramic disc and engaging the other arm of said elbow lever and resisting movement of the lever and serving to hold the first arm of the lever in contact with the thermostatic strip, a contact member mounted on the bottom of the ceramic disc toward which the contact bar is urged by its resilience and away from which it is moved by said lever under actuation of the thermostatic strip.

2,099,153

GAUGER'S TAPE REEL

William L. Walker, Tulsa, Okla.

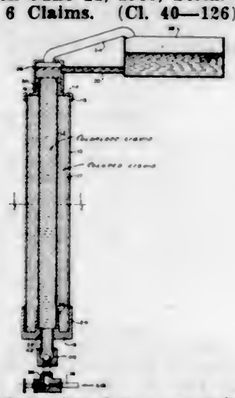
Application July 17, 1936, Serial No. 91,210
7 Claims. (Cl. 242—84.8)

1. The combination with a gaugers' tape reel disposed within a casing and having a tape therein and from which the tape is fed, a handle member for the casing, a clutch means for controlling the feeding of the tape, wiper means for wiping the tape, of a single lever for simultaneously controlling the operation of both the clutch means and the wiper means.

2,099,154

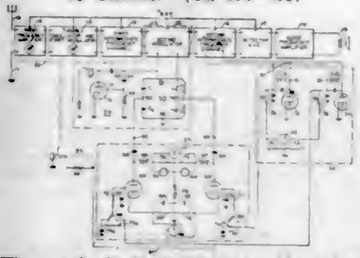
SHRINKAGE CONTROL OF FLEXIBLE PRINTING PLATES AND THE LIKE

Gilbert C. Waters, Rochester, N. Y., assignor to Econo Products, Inc., Rochester, N. Y., a corporation of New York



Application May 7, 1934, Serial No. 724,279
3 Claims. (Cl. 101—379)

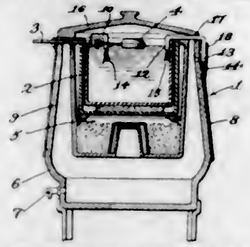
1. A pliable printing plate having substantially zero lateral stretch, comprising a printing surface



of pliable cured rubber, and an integrally associated reinforcing element, comprising a pliable layer of resin-filled fibrous material.

2,099,155
LIQUID DISPLAY DEVICE
Charles W. Weber, Margate City, N. J., assignor to The Texas Company, New York, N. Y., a corporation of Delaware
Application June 11, 1936, Serial No. 84,716
6 Claims. (Cl. 40—126)

1. A liquid display device comprising concentrically arranged and similarly shaped transparent containers, a body of colored liquid adapted to fill the space between the containers, a body of colorless liquid adapted to fill the inner container, and means for causing turbulence of the colorless liquid to give an appearance of agitation to the colored liquid filling the space between the containers.

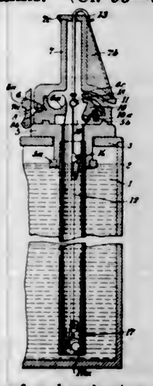


2,099,156
AUTOMATIC FREQUENCY CONTROL FOR OSCILLATION SYSTEMS
Harold A. Wheeler, Great Neck, N. Y., assignor to Hazeltine Corporation, a corporation of Delaware
Application January 25, 1936, Serial No. 60,802
29 Claims. (Cl. 250—20)

1. The method of selective reception of signal-modulated carrier waves which includes: selectively tuning to any desired one of a plurality of modulated signal waves; generating and combining therewith a wave of approximately constant but incidentally variable frequency separation from the carrier frequency thereof to produce a modulated carrier wave of first intermediate frequency; broadly selecting the carrier wave of first intermediate frequency corresponding to said desired signal wave to permit normal deviations in the frequency of said carrier wave without substantial attenuation of the modulation frequencies thereof; generating and combining with said selected first intermediate-frequency carrier wave a second wave of substantially constant frequency to produce a modulated carrier wave of second intermediate frequency; modifying the frequency of said second generated wave within a range of a small per cent of its mean value in accordance with, and responsive to, predetermined deviations of the carrier frequency of said second intermediate-frequency wave from its normal frequency to restore it thereto; sharply selecting the carrier wave of second intermediate frequency corresponding to said desired signal wave; and thereafter converting and utilizing said modulated carrier wave of second intermediate frequency.

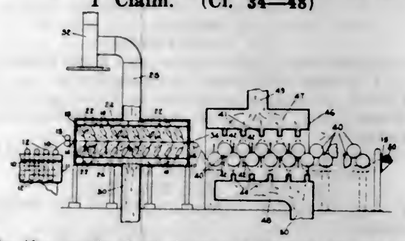
5. In combination; a tuned circuit comprising two arms effectively in parallel each including at least two impedance elements, said arms including, respectively, reactance elements of opposite type; and means for controlling the resonant frequency of said circuit without varying the physical values of any of said elements, comprising a pair of conductive paths individually effectively connected, respectively, across a reactance element of one of said arms and across a reactance element of the other of said arms, and means for adjusting the resistances of said paths to like extent but in opposite senses to alter simultaneously in the same sense the effective inductance and capacitance of said circuit.

2,099,157
WATER COOLER
Guido J. Wiggenhorn, South Pasadena, Calif.
Application November 10, 1936, Serial No. 110,102
3 Claims. (Cl. 62—154)



1. A water cooler comprising a water container having a sleeve of blotting paper embracing its side walls, said container having an open top, a plurality of U shaped tubes containing wicks, said tubes having legs of unequal length, the shorter legs extending into the water container and the longer legs extending between the side walls and the blotting paper, the intermediate portions of the U shaped tubes resting upon the rim of the water container and a removable cover therefor, said cover being provided with notches to accommodate the U shaped tubes resting upon the rim of the water container.

2,099,158
PROCESS OF PREPARING GLUCOSIDES HAVING AN ACTION ON THE HEART OBTAINED FROM OLEANDER LEAVES
Max Bockmühl and Gustav Ehrhart, Frankfort-on-the-Main, Germany, assignors to Winthrop Chemical Company, Inc., New York, N. Y., a corporation of New York
No Drawing. Application June 27, 1936, Serial No. 87,802. In Germany July 12, 1935
4 Claims. (Cl. 87—28)

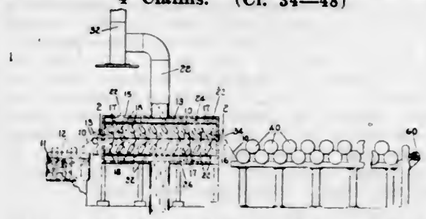


1. The process which comprises extracting an aqueous extract of oleander leaves with a chlorinated aliphatic hydrocarbon, and precipitating the glucosides having an action on the heart dissolved therein by means of a liquid saturated hydrocarbon.

2,099,159
DEVELOPING APPARATUS
Ferdinand Busse, Munich, Germany, assignor to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
Application July 9, 1936, Serial No. 89,718
In Germany July 12, 1935
7 Claims. (Cl. 95—90.5)

1. An apparatus for developing roll film at daylight which comprises a tank for a developing bath, a tube in said tank, means for carrying said tube, an ante-chamber removably mounted on said means and carrying said film, a clip attachable at the advance end of the film for drawing the film into said tube, and a clip attachable to the upper waste end of the film for supporting the film in stretched condition in said tube.

2,099,160
METHOD AND APPARATUS FOR DRYING
William Hale Charch, Buffalo, N. Y., assignor, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
Application October 23, 1935, Serial No. 46,325
1 Claim. (Cl. 34—48)

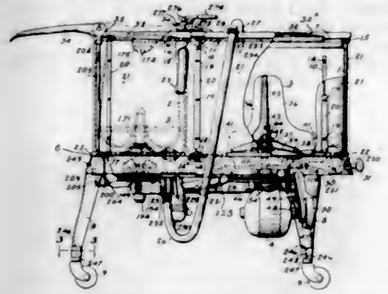


In the method of drying a highly shrinkable, non-fibrous, transparent, cellulosic web adapted to be used as wrapping tissue, which web has been saturated with a treating liquid, the steps comprising passing said web substantially saturated with treating bath liquid through a drying zone comprising a plurality of open flames in which said web is maintained out of contact with any solid surface whereby to preliminarily dry the same, continuing the drying thereof by passing said web into contact with a drying roll, and simultaneously passing a hot gas against a section of said roll in such a quantity and velocity as to prevent adherence of the said web to said roll.

2,099,161
GRINDING MACHINE
Adolph L. De Leeuw, Plainfield, N. J., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts
Application August 30, 1935, Serial No. 38,633
6 Claims. (Cl. 51—105)

1. In a grinding machine, a work holder, a grinding wheel, a steadyrest, a slide for said grinding wheel, a slide for such steadyrest, power means to advance and retract the first named slide, power means to advance and retract the second named slide, means synchronizing movement of said slides, and automatic means to cause said slides to stop at a predetermined position.

2,099,162
PROCESS AND APPARATUS FOR DRYING
Walter C. Eberlin, Kenmore, N. Y., assignor, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
Application October 23, 1935, Serial No. 46,326
4 Claims. (Cl. 34—48)



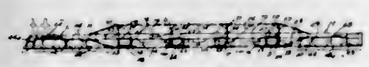
1. In the method of drying highly shrinkable, non-fibrous, transparent, cellulosic webs, the steps comprising preliminarily drying wet webs by passing the same into close proximity with a plurality of open flames on both sides of said web while maintaining the same out of contact with any solid surface until the water content of said webs is below 225% thereof, and continuing the drying thereof while in contact with a drying surface.

2,099,163
COMBINED WASHING AND DRYING MACHINE
Walter A. Frantz, Shaker Heights, and John J. McCabe, Cleveland, Ohio, assignors to The Apex Electrical Manufacturing Company, Cleveland, Ohio, a corporation of Ohio
Application May 27, 1932, Serial No. 614,001
10 Claims. (Cl. 68—15)

1. In a laundry machine, in combination, a casing structure having compartments located side by side, an elongated supporting base of

unitary construction for carrying said casing structure, operating mechanism carried by said base, laundering means in the compartments of said casing structure operatively connected to said mechanism, said base being formed from sheet metal and having horizontal, vertically off-

set portions and angularly disposed interconnecting stiffening web portions whereby a rigid light-weight base is provided, and a gear case for said operating mechanism supported in an aperture formed in the lowermost offset portion of said base.



2,099,164

RAILWAY VEHICLE STRUCTURE

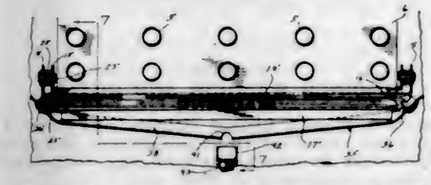
Einar G. Hallquist, Wallingford, Pa., assignor to General Steel Castings Corporation, Granite City, Ill., a corporation of Delaware

Application July 12, 1934, Serial No. 734,708

10 Claims. (Cl. 105—414)

1. A railway vehicle underframe including a center sill, side parts, and cross tie units bracing said parts and with elements for attachment to said center sill, said side parts and cross tie units depending substantially beneath the level of said sill for mounting closure structure for the vehicle under-equipment and the depending portion of one of said cross tie units being located at one end of the underframe and being of streamlined contour for mounting end closure structure for the vehicle under-equipment.

2,099,165



REFRIGERATOR DRIP CATCHER AND AIR CIRCULATION CONTROL

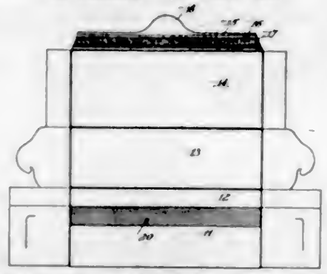
Ray M. Henderson, Houston, Tex.

Application August 16, 1933, Serial No. 685,488

Renewed March 9, 1937

24 Claims. (Cl. 62—103)

23. In a drip catcher, an assembly of spaced apart louvers, an assembly of spaced apart troughs arranged one below the lower edge of each louver, and means insulatively spacing the trough assembly from the louver assembly.



2,099,166

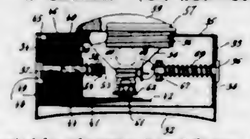
CARTON CONSTRUCTION

Harry A. Inman and William H. Inman, Newark, N. Y., assignors to Bloomer Bros. Company, Newark, N. Y., a corporation of New York

Application March 23, 1936, Serial No. 70,288

14 Claims. (Cl. 229—51)

6. A carton comprising two layers of fibrous sheet material overlapped with each other, adhesive interposed between said two layers for securing the two layers to each other; means on one of said layers to strengthen the bond of the adhesive with that layer, and means on the other of said layers to weaken the bond of the adhesive with that layer.



2,099,167

PORTABLE ELECTRIC HEAD LAMP

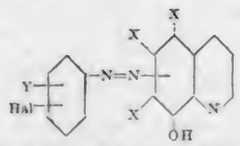
William F. Koepke, New York, N. Y., assignor of thirty per cent to Adolph Berg, New York, N. Y.

Application December 15, 1936, Serial No. 115,904

2 Claims. (Cl. 240—59)

1. A portable electric head lamp including, in combination, a source of electromotive force, a rotatable barrel having a metal end wall forming a conducting member, a lamp bulb carried by said barrel in electrically conductive relationship with said source and an insulating strip carried by said metal end wall to form a make and break member in the electrical connection between the lamp bulb and source.

2,099,168



AZO DYESTUFFS

Max Albert Kunz, Mannheim, and Hans Krzikalla and Walter Limbacher, Ludwigshafen-on-the-Rhine, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware

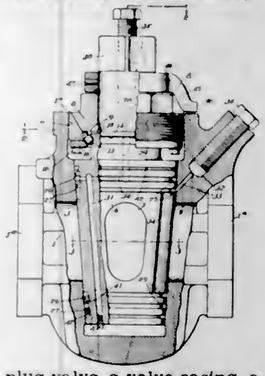
No Drawing. Application April 6, 1934, Serial No. 719,404. In Germany April 13, 1933

3 Claims. (Cl. 260—38.5)

1. Azo dyestuffs, corresponding to the general formula:

wherein the azo group is attached to one of the positions marked X, the remaining X's being selected from the group consisting of hydrogen, halogen, methyl, nitro, amino and SO_3H groups,

and wherein Y is a member of the group consisting of hydrogen and SO_3H, the dyestuffs containing one SO_3H group in their molecule.



2,099,169

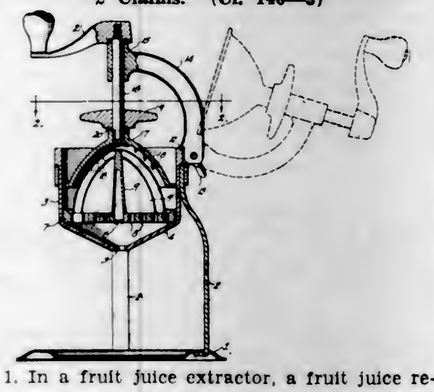
SEALING MEANS

John W. MacClatchie, Los Angeles, Calif., assignor to MacClatchie Manufacturing Company of California, Compton, Calif., a corporation of California

Original application August 8, 1934, Serial No. 738,975. Divided and this application April 26, 1935, Serial No. 18,280

17 Claims. (Cl. 251—93)

11. In a plug valve, a valve casing, a valve plug rotatable in the casing, the plug and casing being metal elements cooperating to define a seating surface, a groove in at least one of said cooperating elements at said seating surface, a side wall of the groove being undercut to form a metal lip integral with said one of the cooperating elements, the groove being open to the seating surface along the opposite side wall of the groove, and means for maintaining pressure in the groove and against the back of the lip, the lip having such inherently slight flexibility as to adapt it for limited expansion responsive to said pressure for sealing the lip against the other of said cooperating elements.



2,099,170

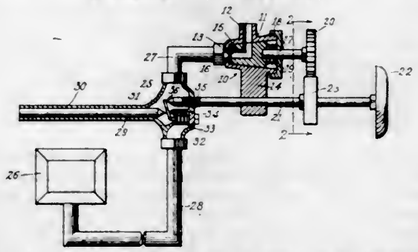
FRUIT JUICE EXTRACTOR

Joseph M. Majewski, Jr., Kansas City, Mo., assignor to Foster L. Talge, Kansas City, Mo., doing business as Rival Manufacturing Company, Kansas City, Mo.

Application June 22, 1936, Serial No. 86,456

2 Claims. (Cl. 146—3)

1. In a fruit juice extractor, a fruit juice receiving member, a standard for supporting said member, a fruit juice outlet for said member, a juice extracting reamer, lugs in said juice receiving member for positioning said reamer therein, an arm positioned adjacent said juice receiving member, said arm carrying a bearing and adapted to be swung into position over said reamer, a shaft slidable in said bearing, a fruit receiving member secured to one end of said shaft for rotation therewith, an operating handle secured to the opposite end of said shaft and a bearing member loosely positioned upon said shaft, adapted to transmit manual pressure upon said fruit receiving member.



2,099,171

COMBINATION GAS COCK AND THERMOSTATIC CONTROL MEANS

Birchard L. Matthews, Lakewood, and John T. Marvin, Fairview Village, Ohio, assignors to The Patrol Valve Company, Cleveland, Ohio

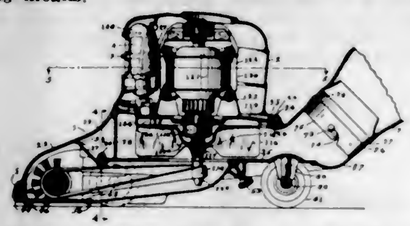
Application October 27, 1934, Serial No. 750,240

2 Claims. (Cl. 236—15)

1. A control device for a fluid fuel burner, comprising in combination, a fuel line adapted to be connected with a source of fuel supply, a fuel flow regulating valve in said fuel line, a thermostat adapted to respond to the heat of the burner and associated with said valve for decreasing and increasing the flow of fuel through the valve in response to increase and decrease respectively, of the heat of the burner, means for regulating the effect of said thermostat on the valve, a shut-off valve in the fuel line, a single control device comprising a rotatable element for actuating the shut-off valve and the regulating means, and an intermittent driving gearing between the rotatable element and the shut-off valve whereby the regulating means for the thermostat can be regulated by further rotation of the rotatable element after the shut-off valve is opened.

2,099,172

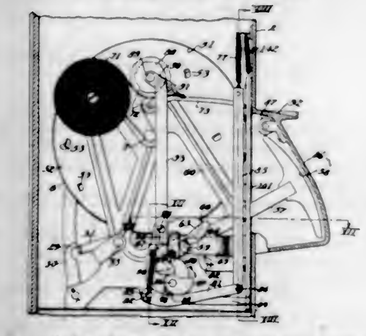
SUCTION SWEEPER



John J. McCabe and Arthur W. Seyfried, Cleveland, Ohio, assignors to The Apex Electrical Manufacturing Company, Cleveland, Ohio, a corporation of Ohio

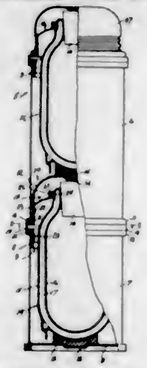
Application June 30, 1933, Serial No. 678,454

18 Claims. (Cl. 15—8)



1. A sectional casing for vacuum cleaners and the like comprising, a motor cap or housing, a shell forming in part the walls of a fan case and suction chamber, a partition member cooperating with said shell and forming a wall of the fan case and in part the walls of the suction chamber at one side of the fan case, a cover plate cooperating with the two last named casing parts to complete the walls of the suction chamber, and means for securing the aforesaid casing parts one to the other in the order named.

3. A brush mounting for power driven suction sweepers comprising, a casing structure defining a suction mouth, a fan case and a communicating passageway therebetween, a suction fan in the fan case, means for driving said fan, a belt pulley rigid with said fan having its axis coaxial with the fan axis, a rotatable brush in the suction mouth, bearing means at the ends of said brush, a spring clip engaging said bearing means for detachably securing said brush and bearing means in the suction mouth, a pulley on said brush, belt means connecting said pulleys, said casing structure including an element rigid therewith in contact with said brush bearing means and in position to take pull of said belt means on said brush, and a brush adjusting member carried by said casing in contact with said bearing means, said member being maintained in its adjusted position by contact with said bearing means.



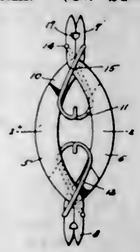
17. In a suction cleaner, a casing structure having smooth and exteriorly finished wall parts defining the suction nozzle, fan case and motor housing of the cleaner, said casing structure including wall sections extending outwardly and downwardly beyond the fan case defining open recesses at the underside of the cleaner, an operating handle for the cleaner having a bail the ends of which project into said recesses through apertures formed in said wall sections, and means beneath such apertures for pivotally securing the ends of said bail to said casing structure, one of the margins of said apertures providing a stop for the operating handle.

2,099,173
RECORDING MECHANISM FOR COIN-OPERATED MACHINES
George E. Norris, Columbus, Ohio
Application April 19, 1935, Serial No. 17,286
3 Claims. (Cl. 273—143)

1. In mechanism of the character described, a plurality of freely and independently rotatable reels, each of said reels being formed to include a hub, an outer peripheral flange and a connecting web uniting the hub with the flange, laterally extending, relatively spaced and spirally disposed stop lugs projecting from the sides of said webs, a plurality of type bars movably supported beyond the confines of said reels, and means operative only when said reels are stationary to advance said type bars from the outer circumference of said reels into engagement with certain of said stop lugs to regulate the printing positions of said type bars.

2,099,174
BOTTLE ASSEMBLY
Arthur H. Payson, Norwich, Conn., assignor to The American Thermos Bottle Company, Norwich, Conn., a corporation of Ohio
Application August 18, 1937, Serial No. 159,687
9 Claims. (Cl. 215—13)

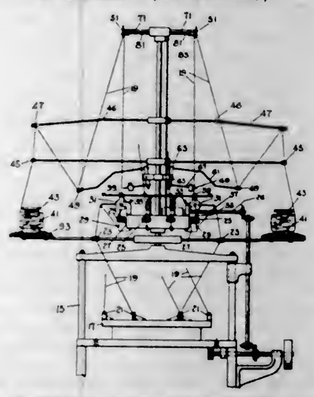
7. An upper bottle, a lower bottle, a casing section for each of said bottles, a coupling head adapted to be secured to the top of each of said casing sections, a closure cap adapted to tightly fit over the upper casing section coupling head, and a cup-shaped bottom closure secured to the upper casing section adapted to tightly fit over the upper coupling head for the lower casing section, and a closure for the lower casing section.



2,099,175
PROCESSED SUGAR AND METHOD OF MAKING THE SAME
Marion D. Rounds, South Braintree, Mass.
No Drawing. Application May 29, 1935, Serial No. 24,103
3 Claims. (Cl. 99—134)

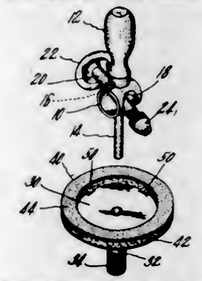
1. A material adapted for use as an ingredient in making cooked frosting, fudge, and similar confectionery, for imparting a creamy texture thereto without beating, which comprises a cooked mixture of sugar, cornstarch, cream of tartar and water, said mixture having a creamy texture and a soft, moist consistency, said cornstarch and cream of tartar being proportioned with each other and with the sugar to maintain said consistency stable over long periods of time.

2,099,176
ALUMINOUS CEMENTS
Edward W. Scripture, Jr., Shaker Heights, Ohio, assignor to The Master Builders Company, Cleveland, Ohio, a corporation of Ohio
No Drawing. Application September 28, 1936, Serial No. 102,889
10 Claims. (Cl. 106—24)



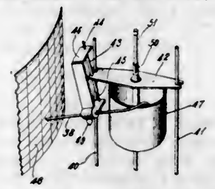
1. The process of making aluminous cement concrete which comprises mixing with aluminous cement, waste sulphite liquor residue.

2,099,177
CLOTHES PIN
David Claude Smith, Jacksonville, Ill.
Application February 13, 1937, Serial No. 125,648
1 Claim. (Cl. 24—81)



A clothes pin comprising a pair of duplicate members having rabbeted end portions provided with cooperating jaw extensions at opposite ends of the members, said rabbeted end portions providing relative movement between the members to open and close the jaws and spring means for each pair of jaws including end portions engaging the outer surfaces of the jaws to yieldably close the jaws and said spring means also including inwardly extending interconnected portions bridging the rabbeted portions and engaging opposite sides of the members to secure the same against lateral movement.

2,099,178
PROCESS AND APPARATUS FOR THE UTILIZATION OF ARTIFICIAL THREAD
Arthur L. Snyder, Garden City, N. Y., assignor, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
Application April 3, 1936, Serial No. 72,621
16 Claims. (Cl. 66—125)

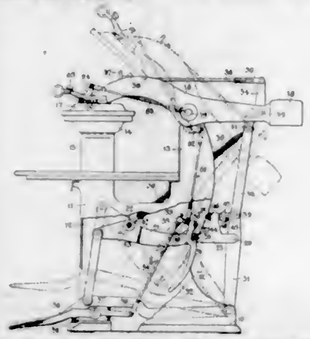


1. In a knitting apparatus suitable for use in knitting fabrics directly from spun cakes of artificial thread, cake supporting means, said cake supporting means having off-set portions to prevent pressure on said cakes at the lower internal periphery thereof, positively driven thread feeding mechanism for feeding the thread to knitting needles; thread tension releasing means, thread compressor means, and thread tension equalizing means, said releasing means, compressor means and equalizing means being positioned between said cake supporting means and said thread feeding mechanism.

2,099,179
SHARPENING DEVICE
Forest A. Stainbrook, Boston, Mass.
Application January 23, 1936, Serial No. 60,465
2 Claims. (Cl. 51—131)

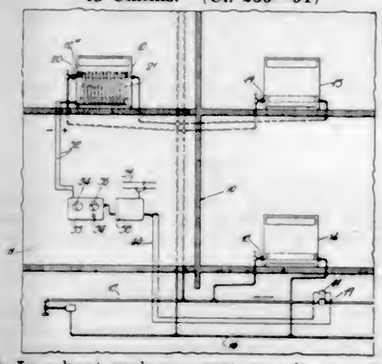
1. In a sharpening device, a ring member of substantial thickness having two annular plane faces and inner and outer circular edges, abrasive material on one of said faces, a supporting disk concentric with said member, and means releasably holding said member in place on said disk, said means consisting of a plurality of ears struck up from said disk and engaging the inner edge only of said member.

2,099,180
LIQUID LEVEL RECORDER
John C. Stevens, Portland, Oreg., assignor to Leupold, Volpel and Company, Portland, Oreg., a corporation of Oregon
Application October 14, 1935, Serial No. 44,967
2 Claims. (Cl. 234—73)



1. In a liquid level recorder, the combination of a movable record receiving surface, marking means comprising an ink well and pen, means for supporting the pen adjacent the record receiving surface, said means being rotatably mounted on a post inclined to the vertical and being axially slidable thereon and having an element for engaging the walls of said well and retaining the pen away from said surface.

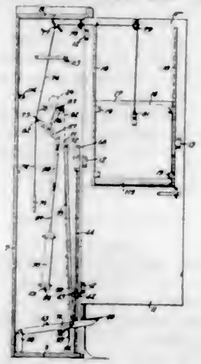
2,099,181
GARMENT PRESSING MACHINE
William Strobridge, Syracuse, N. Y., assignor to United States Hoffman Machinery Corporation, New York, N. Y., a corporation of Delaware
Application April 17, 1936, Serial No. 75,007
13 Claims. (Cl. 38—36)



1. The combination of a press, comprising relatively movable pressing elements; actuating means therefor comprising a secondary toggle arranged to develop the pressing stress between said members as it approaches straight position, and a faster-moving primary toggle connected to shift the secondary toggle toward straight position as the primary toggle approaches straight position; and buffing means interposed between components of the respective toggles, and ar-

ranged to become effective as the two toggles approach straight positions, whereby the buffing reaction occurs between moving elements of the two toggles, and the resulting shock is substantially absorbed therein.

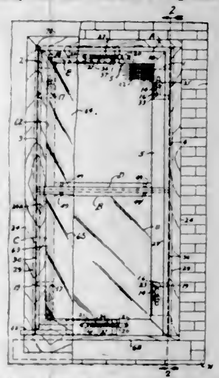
1. In a pressing machine, the combination of a pair of pressing members, one movable relatively to the other; means embodying at least one toggle for moving the movable element into pressing relation with the other; a roller carried by a swinging element of said toggle and adapted to serve as a keeper for a latch; a latch pivoted to a fixed portion of the frame, said latch having a shouldered portion adapted to engage behind said roller when the latch is engaged, said latch having an extension or tail-piece with which the roller contacts to determine the release position of the latch when the toggle is broken and is moved toward or from press closing or opening position; an arm extending laterally from the upper portion of the latch; and means associated with said arm for withdrawing the shouldered portion of the latch from the roller.



2,099,182
HEAT EXCHANGE SYSTEM
William Walter Timmis, Glen Cove, and William K. Walker, New York, N. Y., assignors to American Radiator Company, New York, N. Y., a corporation of New Jersey
Application April 17, 1934, Serial No. 720,928
45 Claims. (Cl. 236—91)

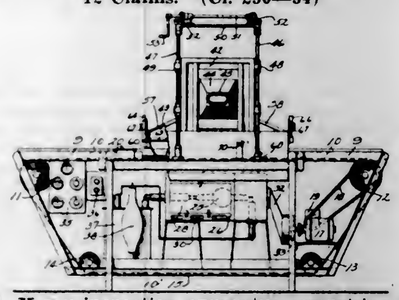
9. In a heat exchange system, a heat exchange element, means for causing variation in a medium proportional to variation in heat exchange rate of said element, means for causing variation in a medium proportional to variation in the rate of heat transfer through the walls of a building, said two means being disposed to balance one medium by the other, and means operated by variation in said mediums from balanced relation for controlling the supply of operating fluid to said element.

38. The method of controlling a heat exchange element, which comprises varying an electric current as a direct measure of the heat exchange rate of said element, varying another current of corresponding range as a measure of the desired heat exchange rate, opposing said currents, and controlling the operation of said element in accordance with the value of said second-named current.



2,099,183
TOWEL DISPENSING DEVICE
James E. Trewhitt and Charles A. Old, Oakland, Calif., assignors to Joseph N. Borroughs, Oakland, Calif.
Application May 13, 1935, Serial No. 21,096
4 Claims. (Cl. 312—38)

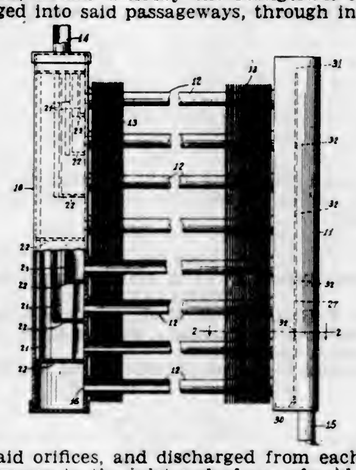
3. In a dispensing device for continuous web toweling comprising a cabinet having a dispensing aperture therein, a closure for said aperture, a magazine adapted to hold a roll of said toweling, and a waste compartment in said cabinet, means for feeding pre-determined portions of said toweling from said magazine into said waste compartment in looped formation past said aperture comprising pairs of feed rollers for engaging said toweling in said magazine and said waste compartment, means for connecting said rollers for rotation together, a lever pivotally mounted in said cabinet and having a treadle portion thereof extending exterior of the cabinet, means operatively connecting said lever with said feed rollers and said aperture closure whereby said rollers will be rotated upon movement of said lever and said aperture closure will be moved to uncover said aperture, said means comprising a sprocket rotatably connected with one of said rollers, a chain engaging said sprocket and operatively connected with said lever, a flexible cord operable by said lever, and connected with said aperture closure, and a rigid member disposed in the loop of said toweling, said rigid member overlying and substantially covering said dispensing aperture.



2,099,184
WINDOW MECHANISM
Frank E. Zick, Dearborn, Mich., assignor of one-half to Charles R. Emery, Dearborn, Mich.
Application May 13, 1935, Serial No. 21,140
21 Claims. (Cl. 189—76)

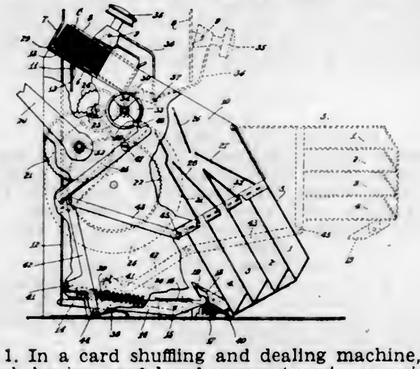
21. In a window mechanism for a window opening, the combination of a frame assembly comprising side portions adjustably connected, resilient means mounted to adjustably expand said frame assembly to fit window openings of differ-

ent sizes, and a window member supported by said frame assembly and extending between its side portions.



2,099,185
X-RAY INSPECTION APPARATUS
Matthew B. Adrian, Milwaukee, Wis., assignor to X-Ray Shoe Fitter, Inc., Milwaukee, Wis., a corporation of Wisconsin
Application September 1, 1934, Serial No. 742,439
12 Claims. (Cl. 250—34)

1. X-ray inspection apparatus comprising the combination with a conveyor for propelling in a predetermined path the articles requiring inspection, and means for actuating said conveyor during inspection of articles thereon, of an X-ray tube arranged to discharge immediately across said path, an X-ray sensitive screen operatively disposed opposite said tube adjacent said path, a viewing chamber enclosing said screen for the exclusion of extraneous light and provided with inlet and outlet openings through which said articles move, and ray confining means at said inlet and outlet through which said conveyor and articles are freely movable.

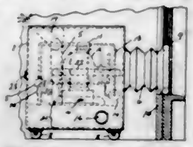


2,099,186
EVAPORATOR COIL
Reuben H. Anderegg, La Crosse, Wis.
Application December 24, 1935, Serial No. 56,034
15 Claims. (Cl. 257—248)

1. A device of the class described, comprising an evaporator having a number of coils, a distributor head comprising a vertically disposed housing, internal walls in said housing forming passageways, a refrigerant inlet chamber in the top of said housing having a number of outlet orifices, means whereby the refrigerant is discharged into said passageways, through individ-

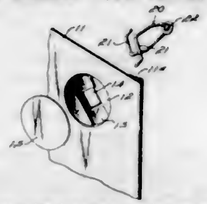
ual said orifices, and discharged from each said passageway to the inlet end of one of said coils.

2,099,187
CARD SHUFFLING AND DEALING DEVICE
Raphael Atti, Union City, N. J., assignor to Homer H. Timbers, Glen Ridge, N. J.
Application March 5, 1935, Serial No. 9,521
8 Claims. (Cl. 273—149)



1. In a card shuffling and dealing machine, a rack having card hand compartments, a casing partially concealing said compartments, means for moving said rack out of said casing into an open position, means including a rotatable shaft for dealing cards into said compartments, means for locking said shaft against rotation, and means controlled by said rack for actuating said last mentioned means.

2,099,188
PORTABLE ROOM COOLING APPARATUS
John R. Ballard, San Francisco, Calif., assignor to Bal-Rod, Inc., San Francisco, Calif., a corporation of California
Application October 23, 1931, Serial No. 570,643
18 Claims. (Cl. 62—129)

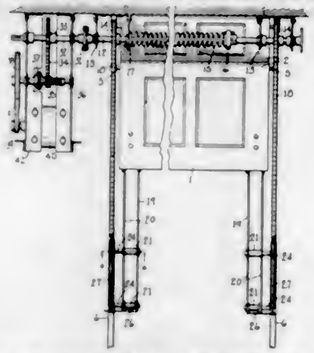


16. A room cooler unit comprising a refrigerant evaporator and air duct therefor, a refrigerant condenser and air duct therefor, means for effecting circulation of room air over said evaporator, means for effecting inflow of outside air

over said condenser and then to the outside for conducting condenser heat to the outside atmos-

phere, and ventilating means for supplying fresh outside air to the room air as it passes through the unit.

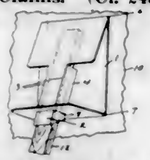
2,099,189
FASTENING DEVICE FOR PANELS OR THE LIKE
Albert P. Ball, Detroit, Mich., assignor to Briggs Manufacturing Company, Detroit, Mich., a corporation of Michigan
Application December 29, 1934, Serial No. 759,615
4 Claims. (Cl. 45—138)



1. A fastener device comprising a sheet metal base having an embossment provided with an apertured offset portion, and a backing piece mounted within the embossment and forming with said offset portion a socket for receiving and supporting a projecting fastener.

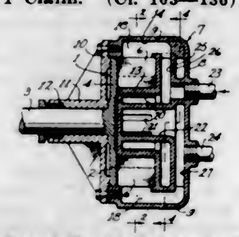
2,099,190
PROCESS FOR DEWAXING OILS
Charles Douglas Barnes, Long Beach, and Marcellus T. Flaxman, Wilmington, Calif., assignors to Union Oil Company of California, Los Angeles, Calif., a corporation of California
No Drawing. Application February 24, 1936, Serial No. 65,414
10 Claims. (Cl. 196—19)

1. A process for conditioning oils preparatory to the separation of wax therefrom which comprises mixing said wax and oil with a wax separation aid containing cholesterol.



2,099,191
SLIDING DOOR
Herbert C. Blodgett, Hartford City, Ind., assignor to Overhead Door Corporation, Hartford City, Ind.
Application October 1, 1936, Serial No. 103,524
21 Claims. (Cl. 20—20)

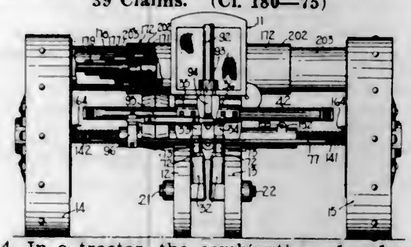
1. In a vertical slidable door comprising a plurality of articulated sections provided with guide rollers, tracks for said rollers operatively mounted adjacent a door jamb and comprising horizontal and vertical portions connected by arcuate portions, means for raising and lowering said door from vertical closed position to horizontal open position and vice versa, comprising a cable attached at one end to the bottom of the door, and means actuating said cable engaging the same intermediate its ends, means for resiliently thrusting the uppermost of said sections against said jamb when said door is in closed position, comprising an arm pivotally connected to the upper section of said door, rollers carried by said arm disposed in one of said tracks, and a



coiled spring connected to the other end of said cable and to the free end of said arm.

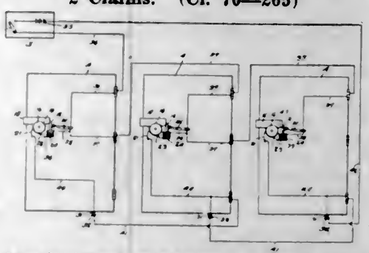
2,099,192
EASEL CONSTRUCTION
Frank O. Brant, Piedmont, Calif.
Application October 12, 1936, Serial No. 105,200
10 Claims. (Cl. 248—37)

1. In easel construction, a generally vertical display board and a rigid leg for supporting the same in upright slightly inclined position, said leg being positioned generally vertically with its upper end adjacent the rear side of the board and extending downwardly divergently outwardly of the board, a flat blank of sheet material separable from the leg secured to the board adjacent the upper end of the leg, and means hingedly connected to said blank arranged and adapted to removably engage the upper end of the leg in substantially embracing relation for removably securing the leg to the board.



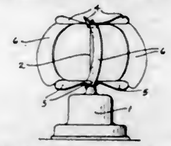
2,099,193
MOTOR OR PUMP
Curtis Francis Brightwell, Pasadena, Calif.
Application November 20, 1935, Serial No. 50,657
1 Claim. (Cl. 103—136)

In apparatus of the kind described to operate with a fluid, the combination of a rotor having an annular body with substantially radial guide slots therein for guiding blades, blades mounted in said slots, a stator comprising heads with a circumferential wall between the same, having outer



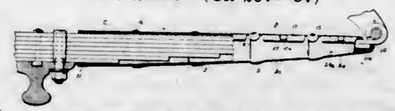
guide faces engaging the outer edges of the blades, one of said heads having an integral neck projecting into the said annular body, the outer side of said neck having inner guide faces for the blades engaging the inner edges of the blades, each of said guide faces extending along a curved line alternately approaching, so as to touch the adjacent face of the rotor and receding from the adjacent face of the rotor so as to form a plurality of chambers to receive the fluid extending along the path of movement of the blades as the rotor revolves, said stator having an inlet corresponding to each chamber and an outlet corresponding to each chamber, and said guide faces operating to shift each blade alternately inwardly and outwardly as the rotor revolves, the head carrying the said neck having an outer wall, an inner wall and an intermediate partition wall between the same, with a common inlet chamber formed between the partition wall and one of said head walls, communicating with all of said inlets, and having an outlet chamber between the partition wall and the other head wall communicating with all of said outlets.

2,099,194
TRACTOR
Theophilus Brown, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application February 15, 1934, Serial No. 711,377
39 Claims. (Cl. 180—75)



4. In a tractor, the combination of a frame, supporting wheels therefor, motive means on said frame for driving certain of said wheels, an axle housing having a central bore, an axle having threaded connection in said bore and adapted when rotated relative to the housing to be moved longitudinally thereof, one of said wheels being journaled on said axle, and means for locking said axle to said wheel whereby rotation of said wheel will cause said axle to move axially in said bore.

2,099,195
ELECTRICAL SAFETY SYSTEM
Irvin E. Butler, Baltimore, Md., assignor of one-half to John C. Fowler, Baltimore, Md.
Application November 30, 1934, Serial No. 755,303
2 Claims. (Cl. 70—265)

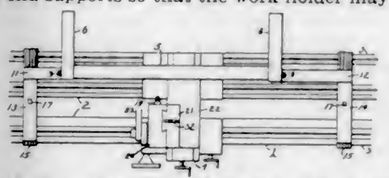


1. An electrical safety system for a structure, including a series of compartments, doors for each of said compartments, locks for said doors, contacts and contact plates carried by the doors and the frames therefor of said compartments, an electrical circuit associated with the locks, contacts and plates therefor, remote control for said circuit, means to manually operate said locks of an individual door when said circuit is energized, and further means to deenergize said circuit until said given door is closed and relocked.

2,099,196
ELECTRIC FAN
John E. Chapman, Springfield, Ill.
Application September 2, 1936, Serial No. 99,016
1 Claim. (Cl. 230—259)

In an electric fan, the combination comprising a motor, a fan shaft, extending uprightly from the motor and adapted to rotate therewith in horizontal plane, a fan fixed on said shaft and establishing a fixed connection adjacent the top and bottom of said shaft; said fan comprising a plurality of radially spaced blades, each curved arcuately with respect to the shaft and irregularly with respect to the plane in which the arc of the blade lies, a curved blade set for movement with each of said blades and fixed at the top of each blade and disposed in position to pull air downwardly from the top of the blade, a second curved blade fixed at the bottom of each of said fan blades for rotation therewith and disposed in position to pull air upwardly thereby.

2,099,197
SPRING COVER
George W. Crabtree, Cleveland Heights, Ohio
Application March 2, 1935, Serial No. 9,097
13 Claims. (Cl. 267—37)

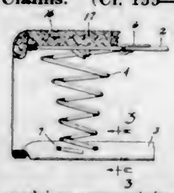


1. A cover for leaf springs comprising a plurality of substantially U-shaped flanged body sections adapted to be inserted over three sides of a spring, said sections having their contiguous end portions arranged in telescoped relation, hinge joint connections struck from the flanges of the sections within the region of said end portions and arcuate shaped bearing joints formed in the walls of the sections opposite said hinge connections, a cap member adapted to fit over said sections and complete the assembly, and means for detachably securing the cap member to the sections.

2,099,198
LATHE ATTACHMENT
Roy Culp, Battle Creek, Mich.
Application October 21, 1936, Serial No. 106,838
16 Claims. (Cl. 82—34)

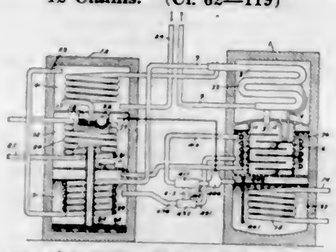
1. The combination with an engine lathe provided with a lathe bed having longitudinal ways, and a saddle, of a work holding attachment mounted on said bed, and a tool holding attach-

ment mounted on said saddle, the work holding attachment comprising spaced transverse rails secured to said longitudinal ways for adjustment longitudinally thereof, cross slides secured to said rails for adjustment longitudinally thereof and transversely of said longitudinal ways of the lathe bed, vertical end supports journalled to said cross slides and arranged in spaced parallel relation above and toward the back of the lathe bed, a work holder disposed between said end supports, and means connecting said work holder to said end supports so that the work holder may be



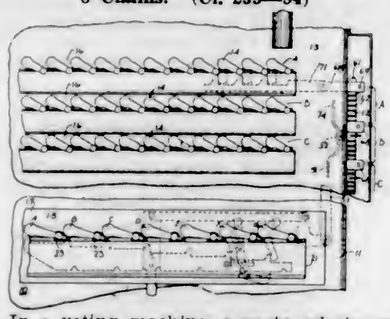
turned up or down through an arc of 90 degrees and secured in adjusted position, and the tool holding attachment comprising an upright fixed to the saddle, a gear carriage connected to said upright for vertical movement, means for moving said gear carriage up and down relative to said upright, a horizontal tool holder carried by said gear carriage and disposed transversely of said longitudinal ways of the lathe bed for cooperation with said work holder, and means acting to rotate said tool holder including a pulley driven worm and worm gear carried by said gear carriage.

2,099,199
ONE-PIECE BUCKLE
John A. Devendor and William A. Devendor, Jackson Heights, N. Y.
Application April 28, 1934, Serial No. 722,858
6 Claims. (Cl. 24—198)



3. A slide for adjustable straps having inner and outer pairs of parallel slots therein and having passages letting obliquely into the slots of the outer pairs through the ends of the slide and passages letting obliquely into the slots of the inner pair through the sides of the slide.

2,099,200
SPRING CUSHION
John A. Findora, Adrian, Mich., assignor to Stubnitz-Greene Spring Corporation, Adrian, Mich., a corporation of Michigan
Application July 14, 1936, Serial No. 90,544
5 Claims. (Cl. 155—180)



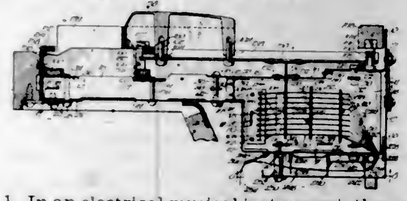
1. A spring cushion comprising a bottom marginal frame of inner and outer members, means securing the inner frame member to the outer frame member, a plurality of slats bridging the opening defined by the frame and secured at opposite ends to the opposite sides of the frame to rigidify the same, a plurality of springs supported by the said slats, a covering for the springs passing downwardly about the outer frame member to compress the springs and then inwardly about the inner frame member, and means securing the covering to the inner frame member whereby the outer frame member acts as a snubber to relieve the fastening means from a substantial portion of the pressure applied to the covering by the said springs.

2,099,201
ABSORPTION REFRIGERATING MACHINE
James L. Getaz, Maryville, Tenn.
Application October 19, 1935, Serial No. 45,755
12 Claims. (Cl. 62—119)

1. In an absorption refrigerating machine, a generator, an absorber, a pump for pumping strong liquor from the absorber to the generator, a motor for driving said pump, said motor being driven by the combined action of the weak liquor passing from the generator to the absorber combined with the action of a portion of the ammonia vapor which has been vaporized in said generator.

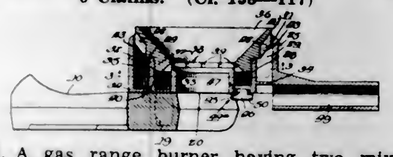
2,099,202
PARTY SELECTOR MECHANISM FOR VOTING MACHINES
Alvin N. Gustavson, Jamestown, N. Y., assignor to Automatic Voting Machine Corporation, a corporation of Delaware
Application November 26, 1932, Serial No. 644,468
8 Claims. (Cl. 235—54)

3. In a voting machine, a party selector unit having a plurality of indicators, a party lockout device for controlling the manipulation of candidate indicators, a bar in said unit, means operated by said indicators to differentially move said bar, an interlocking mechanism in said unit, said interlocking mechanism being connected with the party indicator means and operable thereby to prevent more than one party indicator being moved to indicating position at a time, and



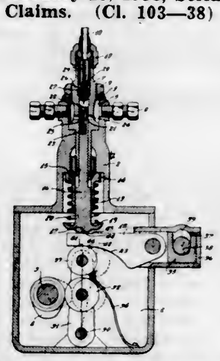
connecting means between said bar and said lockout device whereby manipulation of a party indicator will cause said lockout device to operate and release the corresponding party group of candidate indicators for voting.

2,099,203
ATTACHMENT FOR SMOKING PIPES
Harold F. Haines, Olympia, Wash.
Application February 9, 1935, Serial No. 5,751
6 Claims. (Cl. 131—12)



1. A device adapted to be removably secured to a smoking pipe having a headed pin extending from the stem thereof, comprising a shank having edges conforming to the shape of the inside of the smoking pipe bowl and terminating at one end in a picking point and at the other end in a tamping head, integral with said shank and bent therefrom at substantially right-angles; said shank being arcuate in longitudinal form and being adapted to be sprung under the head of the pin.

2,099,204
MULTIPLE KEY SWITCH
Laurens Hammond, Chicago, Ill.
Application April 24, 1936, Serial No. 76,157
19 Claims. (Cl. 84—337)

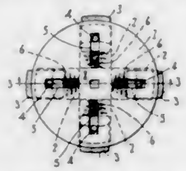


1. In an electrical musical instrument, the combination of a manual composed of a plurality of keys, a bank of switch fingers for each key, said banks of switch fingers being arranged in planes each in substantial alignment with its associated key, a plurality of bus bars extending in a direction perpendicular to the planes of said banks of switch fingers and each bus bar being located in a position to be contacted by one of the switch fingers of each bank, and an actuator for each bank of said switch fingers operable by the associated key to move the switch fingers into engagement with said bus bars respectively.

2,099,205
GAS BURNER
Philip S. Harper, Chicago, Ill.
Application December 26, 1933, Serial No. 703,902
6 Claims. (Cl. 158—117)

1. A gas range burner having two mixing tubes, said mixing tubes leading to a burner means having two separate chambers therein, each of said tubes connecting to one of said chambers, one of said chambers surrounding a central hole in said burner means, the other of said chambers surrounding the first mentioned chamber, said burner means having a common wall separating said two chambers, said burner having a removable top substantially engaging said common wall separating said two chambers, said top engaging said burner means in addition at the outside of said burner means and at said hole, and of said three points of a substantial engagement of said burner top with said burner means, the points of engagement around said central hole being at the lowest level and the point of engagement around the outer diameter of said burner being at the highest level of all three points of engagement.

2,099,206
FUEL PUMP
Lars Olaf Hedblom, Detroit, Mich., assignor of one-half to Gustav A. Carlson, Detroit, Mich.
Application February 18, 1935, Serial No. 6,988
2 Claims. (Cl. 103—38)

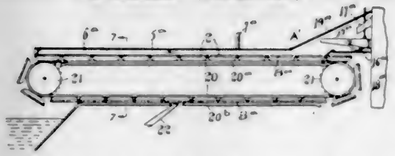


1. In a fuel injector, a plunger, a rocker arm pivoted at one end, means for rocking said arm to cause swinging movement of the free end thereof through a predetermined arc, an operating arm interposed between the swinging end of said arm and said plunger and adapted to be moved by said swinging end to impart movement to said plunger, said operating arm having an arcuate portion of uniform thickness with one of the arcuate surfaces thereof engaged by said swinging end and the other arcuate surface engaged by said plunger, the two arcuate surfaces having a common center of curvature, said operating arm having a cam surface merging with the arcuate surface engaged by said rocker arm, means supporting said operating arm, said common center of curvature being coincident with the axis of swinging movement of said rocker arm, and means for adjustably moving said operating arm with respect to said rocker arm.

2,099,207
VALVE GRINDER
Harry S. Hill and Charles H. Williams, Springfield, Ohio
Application August 7, 1936, Serial No. 94,763
4 Claims. (Cl. 51—184.2)

1. In a valve grinder, a tapered head having a series of radially extended pockets open at their outer ends, a grinding element located in each pocket, the outer end of said grinding element being tapered to conform to the tapered shape of said head, a coil spring located between the

rear end of each grinding element and the inner end of the pocket in which it is located, and



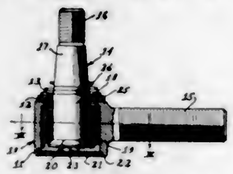
means for limiting the outward throw of each grinding element.

2,099,208

APPARATUS FOR PREVENTING THE OXIDATION OF METALS

William H. D. Horsfall and Maunsell B. Jackson, Toronto, Ontario, Canada

Application March 2, 1936, Serial No. 66,615
4 Claims. (Cl. 22—57)



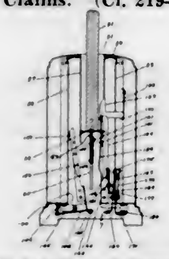
1. In apparatus of the class described the combination of a tunnel-shaped hood formed with a top and opposed sides depending from the top, the hood being open at the bottom throughout its length and at each end and formed as a continuous passage-way; a mold having its top above the level of the lower edges of the sides of the hood; means for moving the mold longitudinally into, through and out of the hood; and means for introducing a non-oxidizing gas or vapor into the hood above the level of the top of the mold so that the gas or vapor may flow lengthwise of the hood to the open ends to drive air from the hood and exclude it therefrom.

2,099,209

LUBRICATED RUBBER JOINT

George H. Hufferd, Detroit, Mich., assignor to Thompson Products, Incorporated, Cleveland, Ohio, a corporation of Ohio

Application April 11, 1935, Serial No. 15,797
5 Claims. (Cl. 287—93)



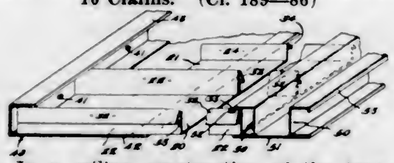
1. A universal joint comprising a housing having a cylindrical bore extending therethrough and an inturned flange at one end thereof defining a restricted annular opening, a stud extending freely through said opening having a cylindrical bearing portion disposed in said bore, a resilient bushing disposed in bearing contact around said bearing portion and held under compression by said housing walls, a head portion on said stud to prevent the stud from being pulled out of said bushing, a closure plate for said housing spaced from said stud head to define with the stud head and housing walls a fluid tight chamber and castor oil in the chamber.

2,099,210

AUTOMATIC ELECTRIC TOASTER

Murray Ireland, St. Paul, Minn., assignor to McGraw Electric Company, Chicago, Ill., a corporation of Delaware

Application March 25, 1935, Serial No. 12,834
17 Claims. (Cl. 219—19)



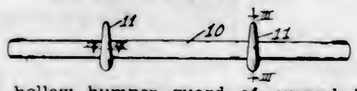
1. An electric toaster comprising in combination, a casing, a heating element therein, a bread slice support spring-biased to one position, means for moving it to and latching it in a second position and thermally-actuated latch-releasing means including an initially outwardly bowed bimetal bar adapted to have substantially its entire length closely operatively engaging the surface of a slice of bread being toasted during substantially all of the toasting period, and means actuated by the bread slice support to effect and maintain said close engagement.

2,099,211

BUILDING CONSTRUCTION AND PANEL FOR USE THEREIN

William I. Lucius, Rochester, N. Y.

Application January 29, 1935, Serial No. 3,937
10 Claims. (Cl. 189—86)



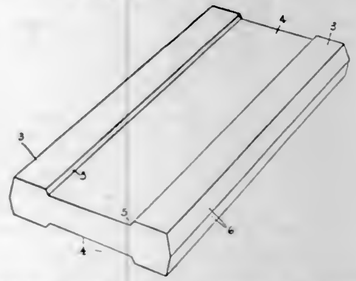
1. In a ceiling construction of the type described, a plurality of supporting channel members arranged with their side flanges extending upwardly and being attached to the floor above, a plurality of intermediate channel members, the side flanges of which are provided with means coacting with the side flanges of the supporting channel members to interlock said members to form an integral ceiling.

2,099,212

BUMPER GUARD

George Albert Lyon, Allenhurst, N. J.

Application July 30, 1935, Serial No. 33,895
4 Claims. (Cl. 293—55)



3. A hollow bumper guard of cupped form adapted to be secured on the front face of a bumper bar and with a closed top projecting above the bar, said guard having a portion on the rear side thereof and adjacent the lower end of the rear side shaped to provide a seat for the front face of a bumper bar, said guard being also shaped to present side and front impact faces extending below the rear face of said guard.

2,099,213

WAX CAKE

Lewis H. Macomber, Kalamazoo, Mich., assignor to Kalamazoo Paraffine Company, Kalamazoo, Mich.

Application June 12, 1935, Serial No. 26,193
4 Claims. (Cl. 196—149)

1. As an article of manufacture, an elongated flat cake of paraffin wax having flat parallel side surfaces at each edge thereof, and a central recess of substantial depth between said flat surfaces, the recesses extending from end to end of the cake so that when a plurality of said cakes are superimposed one upon another the flat side surfaces are in contact and the recessed portions opposed providing longitudinal passages between the cakes, the edges of said cakes being oppositely beveled from a central point to the said side surfaces.

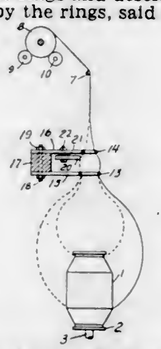
2,099,214

PROCESS FOR FORMING THE SULPHURIC ESTERS OF UNSATURATED HIGHER ALCOHOLS

Walter H. McAllister, Wyoming, Ohio, assignor to The Procter & Gamble Company, Cincinnati, Ohio, a corporation of Ohio

No Drawing. Application October 17, 1935, Serial No. 45,503
13 Claims. (Cl. 260—99.12)

1. The process of making a sulphuric ester of an unsaturated higher aliphatic alcohol, which comprises treating said higher alcohol with the addition product formed by treating dioxane with a sulphating agent selected from the group consisting of sulphur trioxide and chlorsulphonic acid, without substantially saturating the double bond.



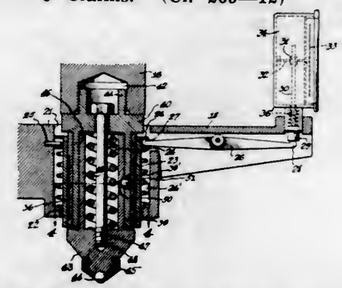
2,099,215

PRODUCING HAIRY RAYON YARN

James E. Moore, Rome, Ga., assignor to Tubize Chatillon Corporation, New York, N. Y., a corporation of Delaware

Application July 30, 1936, Serial No. 93,385
10 Claims. (Cl. 117—21)

1. Apparatus for producing hairy yarn by cutting exterior filaments of the yarn at intervals along its length which comprises a pair of parallel stationary coaxial rings spaced from each other along their common axis, means for drawing the yarn through the rings in a loose condition, and means for cutting the loose yarn as it passes through the rings and describes a plane of rotation defined by the rings, said cutting means



being disposed at one or more points in the plane of rotation and projecting thereinto.

2,099,216

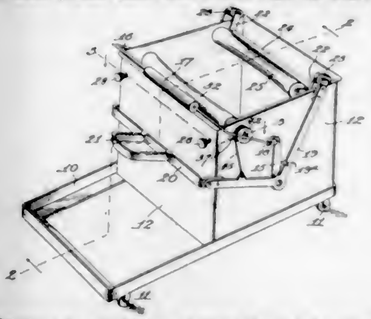
METAL TESTING MACHINE

Frederick H. Nass and Ralph Campbell, Detroit, Mich.

Application May 4, 1934, Serial No. 723,954
6 Claims. (Cl. 265—12)

1. In a device of the character described, a plurality of relatively nesting parts, a test ball carried by one of said parts, an indicator connected to the other of said parts, frictional means for connecting said parts through relative movement therebetween, and pressure means for moving one of said parts.

2,099,217



MOP WRINGER

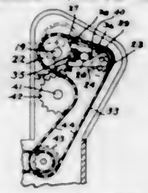
Clinton C. Newland, Glendale, Calif., assignor to Frederick A. Speik, South Pasadena, Calif.

Application February 13, 1935, Serial No. 6,294
4 Claims. (Cl. 15—262)

1. In a mop wringer, a base having a front cross rail, a receptacle rigidly secured on the rear portion of said base so that the forward portion of said base including said front cross rail projects a substantial distance in front of said receptacle, a wringing roll journaled in the upper front portion of said receptacle, a frame pivotally mounted on the sides of the receptacle, said frame including a rail that extends across the front of the receptacle, a wringing roll carried by the upper rear portion of said frame, a pedal projecting forwardly from the front portion of said pivoted frame, the sides of the extended front rail of said base forming a bearing and stop for the front rail of said pivoted frame when the same is pedally actuated to position the wringing roll carried by said frame adjacent the

roll in the upper front portion of the receptacle and said pedal and the front rail of said base

combining to provide a support and bearing for the foot that is utilized in depressing the pedal when the latter is at its lower limit of movement.



2,099,218

DRIVING MECHANISM TO MAINTAIN CONSTANT THE REQUIRED LENGTH OF AN ENDLESS DRIVING MEANS

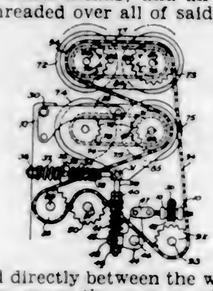
Frederick A. Nicholson and Wilmot T. Pritchard, Seattle, Wash., assignors to Stetson-Ross Machine Company, Seattle, Wash., a corporation of Washington

Application December 21, 1936, Serial No. 116,960

5 Claims. (Cl. 74—242.15)

1. In a device of the class described, wheel mounting means; pivotal supporting means for said wheel mounting means; a first rotatable wheel mounted on said wheel mounting means and to one side of the said pivotal supporting means; a second rotatable wheel mounted on said wheel mounting means and to the other side of said pivotal supporting means; other wheel mounting means; a third rotatable wheel mounted on said other wheel mounting means and offset relative to said first and second wheels; and an endless driving means threaded over said first, second and third wheels, whereby, upon pivotal movement of said pivotal supporting means the difference in length of the endless driving means required between the third wheel and the first wheel is substantially compensated for by the length of the endless driving means required between the third wheel and the second wheel.

2,099,219



MECHANISM TO MAINTAIN CONSTANT THE REQUIRED LENGTH OF AN ENDLESS DRIVING MEANS

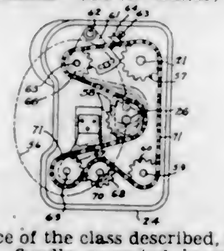
Frederick A. Nicholson and Wilmot T. Pritchard, Seattle, Wash., assignors to Stetson-Ross Machine Company, Seattle, Wash., a corporation of Washington

Application December 21, 1936, Serial No. 116,961

5 Claims. (Cl. 74—242.15)

1. In a device of the class described, a pair of rotatably mounted wheel means angularly positioned as respects each other; a second pair of rotatably mounted wheel means angularly positioned as respects each other and positioned substantially similarly to the positioning of the wheels of the first mentioned pair; an adjustably mounted means; bearing means in said adjustably mounted means rotatably supporting a dissimilarly positioned wheel means of each of said pairs; other wheel means; and an endless driving means threaded over all of said wheel means

and threaded directly between the wheels of each pair, whereby, upon the movement of said adjustably mounted means, the difference in length of the endless driving means required between the wheels of one of said pairs is substantially compensated for by the length of the endless driving means required between the wheels of the other of said pairs.



2,099,220

MECHANISM TO MAINTAIN CONSTANT THE REQUIRED LENGTH OF AN ENDLESS DRIVING MEANS

Frederick A. Nicholson and Wilmot T. Pritchard, Seattle, Wash., assignors to Stetson-Ross Machine Company, Seattle, Wash., a corporation of Washington

Application December 21, 1936, Serial No. 116,962

6 Claims. (Cl. 74—242.15)

1. In a device of the class described, two spaced apart wheels; fixedly mounted bearing means supporting each of said two wheels for rotary movement; a third wheel positioned substantially intermediate of and off-set relatively to said two wheels; movably mounted bearing means supporting said third wheel for rotary movement and for movement substantially in a plane approximately parallel to a plane passing between said two wheels; and endless driving means threaded over said two wheels and said third wheel, whereby substantial movement of said third wheel in said plane may obtain without requiring a material change of length of said endless driving means.

2,099,221

DROP BAR CLEAN-OUT

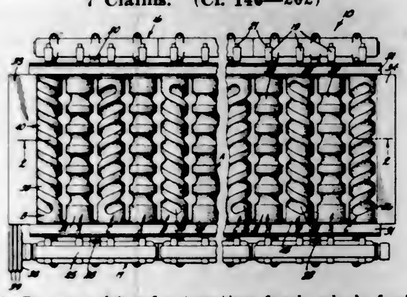
Gerald C. Paxton, Santa Ana, Calif., assignor, by mesne assignments, to Food Machinery Corporation, a corporation of Delaware

Application March 23, 1936, Serial No. 70,493

14 Claims. (Cl. 146—202)

1. In combination with a fruit treating machine of the type employing a series of treating rolls rotatable about fixed axes and arranged transversely to the flow of fruit thereover and in adjacent parallel relation to form fruit supporting valleys therebetween whereby fruit resting in each valley is dislodged therefrom by incoming fruit and caused to pass into the next valley: a cleanout bar disposed parallel to said rolls; guide means disposed substantially at the plane of the crests of said rolls; endless chains guided by said guide means; arms extending angularly from opposite ends of said bar and pivotally connected

to said chains, said pivot points being spaced a substantial distance longitudinally of said machine from said bar and permitting said bar to freely rest on the crests of said rolls when disposed opposite these; said arms being substantially shorter than the distance spacing the axes of adjacent rolls; and means for limiting the downward swing of said arms about said pivot points to prevent undue friction being set up between said bar and the surface of one of said rolls when the latter is engaged by said bar.



2,099,222

FRESH FRUIT BRUSHER

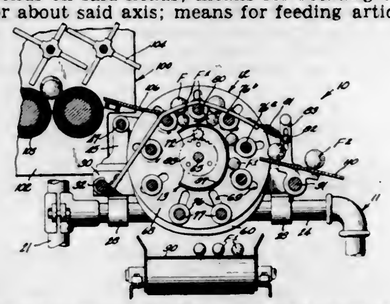
Gerald C. Paxton, Santa Ana, Calif., assignor, by mesne assignments, to Food Machinery Corporation, a corporation of Delaware

Application March 23, 1936, Serial No. 70,494

7 Claims. (Cl. 146—202)

1. In a machine for treating fresh whole fruits, the combination of: a series of parallel brush rollers placed close together and rotatively mounted on fixed axes disposed transversely of the direction of travel of said fruit over said brush rollers to provide a fruit treating table having fruit treating valleys between adjacent pairs of brush rollers, said fruit resting in said valleys and being rotated and brushed by said brush rollers, and progressing from valley to valley in passing through said machine; and means for rotating said brush rollers in the same direction at a speed substantially between 100 R. P. M. and 275 R. P. M., certain pairs of adjacent brush rollers having one brush roller of each such pair provided with a series of annular grooves of such size as to accommodate said fruit and the other brush roller of each such pair provided with obliquely disposed grooves.

2,099,223



SIZER

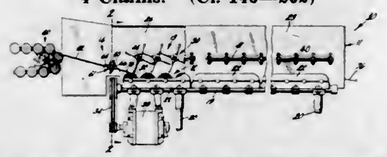
Hale Paxton, Santa Ana, Calif., assignor, by mesne assignments, to Food Machinery Corporation, a corporation of Delaware

Application January 18, 1935, Serial No. 2,367

17 Claims. (Cl. 209—106)

1. In a sizer for rollable articles the combination of: a rotor mounted on a horizontal axis and including two rotor heads; sizing members disposed in spaced relation with each other on said rotor and parallel to said axis, said members being rotatably journalled at their opposing ends on said heads; means for rotating said rotor about said axis; means for feeding articles

to be sized onto said sizing members when said members are disposed above said axis; means for receiving from said members the larger of said articles which fail to pass between said members; means for receiving the smaller of said articles which pass between said members; and means for rotating said members while the larger of said articles are resting thereon.



2,099,224

LEMON WASHER

Hale Paxton, Santa Ana, Calif., assignor, by mesne assignments, to Food Machinery Corporation, a corporation of Delaware

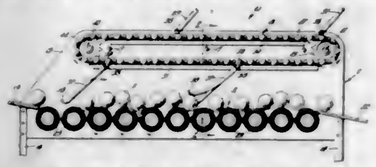
Application May 31, 1935, Serial No. 24,185

4 Claims. (Cl. 146—202)

1. In combination: a series of transverse fruit treating rollers providing a series of valleys between said rollers; means for rotating said rollers in the same direction to treat fruit resting in said valleys; a plurality of rotary clean out members, one of which is disposed over and substantially parallel with each of said valleys; a plurality of rows of spaced fingers extending substantially radially from each of said members, the fingers of each member being axially offset from the fingers of adjacent members and of such length as to pass between said last mentioned fingers when said members are rotated; and means to rotate said members in the same direction to maintain corresponding rows of fingers on all said members substantially parallel at all times during rotation of said members.

2,099,225

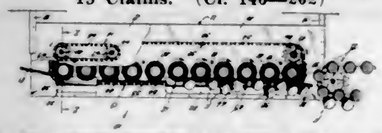
CLEAN-OUT



Hale Paxton, Santa Ana, Calif., assignor, by mesne assignments, to Food Machinery Corporation, a corporation of Delaware

Application May 31, 1935, Serial No. 24,186

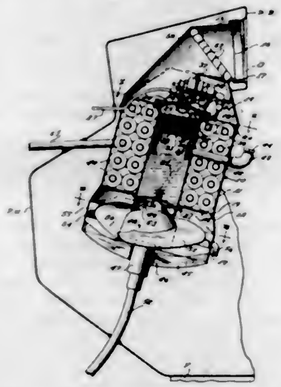
3 Claims. (Cl. 146—202)



1. In a fruit brushing machine, the combination of: a frame; a plurality of juxtaposed, cylindrical brushes journalled transversely on said frame, the uppermost sides of said brushes form-

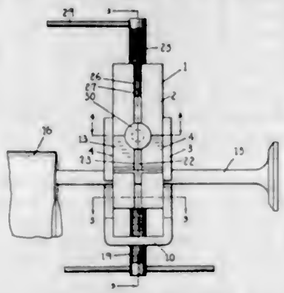
ing a fruit brushing surface, said surface being characterized by fruit receiving valleys, one of which is disposed between each adjacent pair of said brushes; means for rotating said brushes in a common direction; overhead travelling clean out carrier means; a clean out carried by said carrier means over said fruit brushing surface, said clean out including a plurality of relatively long resilient fingers extending downwardly and rearwardly at a substantial angle with the horizontal

to a point close above said brushing surface, the lower ends of said fingers being formed of soft material and being turned upwardly so that when said finger ends are engaged by fruit traveling over said brushing surface at a rate in excess of the speed of said carrier means a rolling contact is established between said fruit and said finger ends which lifts said finger ends upwardly and rearwardly and permits said fruit to rotate forwardly between said brushing surface and said fingers.



2,099,226
CLEAN-OUT
Hale Paxton, Santa Ana, Calif., assignor, by mesne assignments, to Food Machinery Corporation, a corporation of Delaware
Application May 31, 1935, Serial No. 24,187
15 Claims. (Cl. 146—202)

1. In a fruit brushing machine, the combination of: a frame; a plurality of juxtaposed, cylindrical brushes journalled transversely on said frame, the uppermost sides of said brushes forming a fruit brushing surface characterized by fruit receiving valleys one of which is disposed between each adjacent pair of said brushes; means for rotating said brushes in a common direction; a guide track at each side of said frame, said tracks conforming substantially to arcuate crest portions of the contour of said brushes; a transverse bar movable over said brushing surface, the ends of said bar being guided by said guide tracks at points disposed substantially on the axis of said bar; and power means for moving said bar over said brushing surface, said bar feeding fruit from valley to valley, said bar, when contacting fruit disposed in each of said valleys, urging said fruit onto the brush forming the advance wall of said valley, said fruit then rolling over said brush into the next of said valleys, said bar being returned to starting position in a plane out of the path of fruit on said brushing surface.

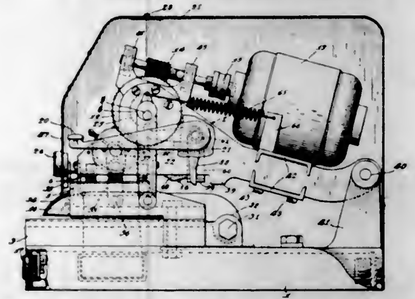


2,099,227
AIR COOLING UNIT FOR AUTOMOTIVE VEHICLES
Ralph F. Peo, Buffalo, N. Y., assignor to Houde Engineering Corporation, Buffalo, N. Y., a corporation of New York
Application October 7, 1935, Serial No. 43,845
8 Claims. (Cl. 62—102)

1. An evaporator unit adapted to be mounted behind the dashboard in an automotive vehicle comprising a casing having an air inlet and outlet, cooling coils in said casing between said inlet and said outlet, a receptacle for refrigerant in

said casing in heat transfer relation with said coils, and means for expanding refrigerant from said receptacle into said coils.

2,099,228
DEVICE FOR GROOVING VALVE STEMS AND THE LIKE
Harold P. Phillips, Hastings, Mich., assignor to Hastings Manufacturing Company, Hastings, Mich.
Application March 18, 1937, Serial No. 131,632
11 Claims. (Cl. 82—4)

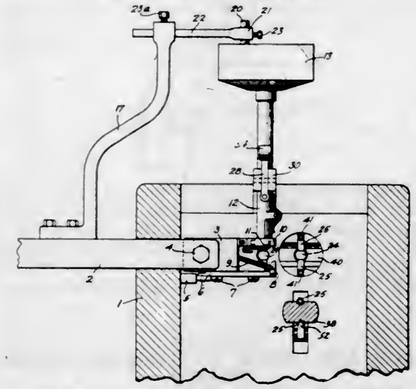


1. A device of the class described for circumferentially grooving rod-like work comprising a pair of telescopingly associated body members provided with opposed V-shaped jaws, said body members being open at one side to permit the introduction and removal of the work when the jaws are open, screw means for adjusting said body members for bringing said jaws into supporting and guiding engagement with the work or to release the same, one of the body members having a longitudinal groove-like tool seat and also having a longitudinal internally threaded bore opening to said tool seat, a tool disposed in said seat and having a notch facing said bore, and a feed screw for said tool having threaded engagement with said threaded bore and provided with a swivel head engaging said notch in said tool, and a clamping screw disposed transversely of said tool seat for clamping said tool in its adjusted positions in said seat.

2,099,229
FIN EQUIPPED RUDDER
Louis Possenheim, New York, N. Y.
Application January 15, 1936, Serial No. 59,184
1 Claim. (Cl. 114—162)

In a ship, a rudder, substantially flat, rhomboidal-shaped fins on top and bottom edges and fins to both sides of the rudder arranged in halves on opposite sides of the rudder, supplementing one another to a whole fin, extending from the centre rearward.

2,099,230
PERFORATING MACHINE
Edward G. Rix, Chicago, Ill., assignor to American Perforator Company, Chicago, Ill., a corporation of Illinois
Application February 15, 1936, Serial No. 64,116
16 Claims. (Cl. 101—26)



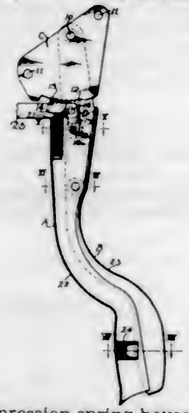
1. Apparatus for mutilating sheets comprising an oscillatable head which when oscillated effects the mutilating operation, a rotary electric motor mounted on said oscillatable head and mechanism whereby rotation of said motor effects oscillation of said head.

6. Apparatus for mutilating sheets comprising a reciprocable head, sheet mutilating means controlled by the reciprocation of said head, means for controlling the reciprocation of said head comprising a motor and a clutch for connecting and disconnecting the motor with respect to the head, a trip member for controlling the clutch, a removable casing for housing the head, motor, clutch and trip, and trip operating means carried by said casing operable from the outside of the casing and freely disengageable and engageable with respect to the trip member in removing and replacing the casing.

2,099,231
HALOGENATION OF UNSATURATED COMPOUNDS
Jan D. Ruys, Pittsburg, and James W. Edwards, Concord, Calif., assignors to Shell Development Company, San Francisco, Calif., a corporation of Delaware
No Drawing. Application June 10, 1935, Serial No. 25,940
20 Claims. (Cl. 260—162)

1. A process for the production of a valuable organic halogen addition product which comprises reacting a hydrocarbon possessing an olefinic linkage between two aliphatic carbon atoms with an amount of a halogen not in excess of that theoretically required to completely react therewith by addition, said reaction being effected under a substantial superatmospheric pressure and practically anhydrous conditions in the presence of a catalyst essentially comprising dehydrated calcium chloride at a temperature of from about 20° C. to about 120° C.

2,099,232
BLANK FEEDING MEANS
Heyman Rosenberg, New York, N. Y.
Application December 30, 1936, Serial No. 118,226
14 Claims. (Cl. 10—162)



1. In die stamping apparatus for wing-nuts, the combination of a container for wing-nut blanks of a tube leading directly downward from the bottom of the container for conducting the blanks downward in end to end, aligned relation, said tube having a funnel-like mouth of substantially circular cross-section, the lower end of said mouth being of less diameter than the upper end thereof, but of greater diameter than one-half the diameter of said upper end, and means for agitating wing-nut blanks within the container.

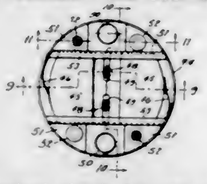
3. In feeding apparatus for nut blanks for nut stamping mechanism, the combination, with a blank feeding tube, of a detent extending into the tube in position to engage a blank and positively obstruct the descent of blanks within the tube for temporarily preventing feeding thereof, a blank carrier movable across the lower end of the tube between blank receiving and blank delivering positions and effective to prevent escape of a blank from the tube when not in blank receiving position, means for operating the blank carrier, and means for positively operating said detent to a non-obstructing position in timed relation to the movements of the carrier when the carrier is not in receiving position.

2,099,233
BRAKE LEVER CONSTRUCTION
Ray A. Sandberg, Waukegan, Ill., assignor to Oakes Products Corporation, North Chicago, Ill., a corporation of Michigan
Application November 16, 1936, Serial No. 110,971
5 Claims. (Cl. 74—537)

1. Brake lever construction including a lever proper and an actuating member formed as double U-shaped stampings and assembled in pivoted relation with the webs in opposition and the

walls of one snugly fitting against the walls of the other, a right angular pawl pivoted to the lever proper with one leg extending generally in the direction of the length of the lever and having sliding engagement with said actuating mem-

ber, and a compression spring housed in the lever proper and bearing against the other leg of the pawl at substantially right angles to said leg to exert a direct push against said leg to maintain the pawl in latched engagement with a ratchet and to maintain said lever in one position.



2,099,234

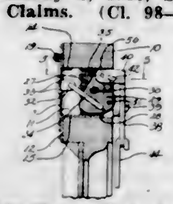
CHECK AND CHECK CONTROLLED MECHANISM

William K. Schauweker, Cleveland, Ohio

Application February 18, 1936, Serial No. 64,548

8 Claims. (Cl. 194—4)

6. A mechanical check for use in connection with a check controlled device, comprising, separable parts, means tending to separate such parts, means for holding such parts against separation and means for releasing said holding means.



2,099,235

STORM WINDOW TOP VENTILATOR

Francis J. Schmidt, Wauwatosa, Wis.

Application January 6, 1936, Serial No. 57,671

8 Claims. (Cl. 98—97)

1. The combination with a storm sash having a slotted top rail, of a correspondingly slotted reinforcing plate secured to the outer surface of said rail and provided with inturned flanges respectively engaging the top and bottom walls of the sash rail slot, an outwardly swinging shutter in hinged relation to the top rail above said slot, a bracket struck up from one of said flanges and positioned within said top rail slot, a shutter actuating plate pivotally secured to the bracket and linked to the shutter, and a lever having one end linked to, and adapted to oscillate said plate, said lever being provided with depending operating linkage associated with one side rail of said sash.

2,099,236

COATING COMPOSITION AND PROCESS OF PREPARING SAME

Robert L. Sibley, Nitro, W. Va., assignor, by mesne assignments, to Monsanto Chemical Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application February 15, 1932, Serial No. 593,198

20 Claims. (Cl. 134—56)

1. A coating composition containing a drying oil having incorporated therein a positive oxidation catalyst and a controller of oxidation thereof comprising a reaction product of a ketone and an amine or a derivative thereof.

5. A coating composition containing a drying oil having incorporated therein a positive oxidation catalyst and a controller of oxidation thereof comprising a reaction product of an aliphatic group containing ketone and an aromatic primary amine.

2,099,237

COATING COMPOSITION

Robert L. Sibley, Nitro, W. Va., assignor, by mesne assignments, to Monsanto Chemical Company, Wilmington, Del., a corporation of Delaware

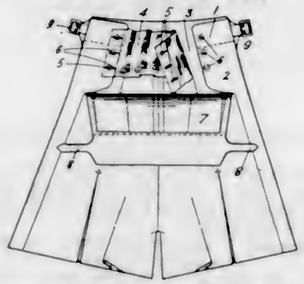
No Drawing. Application February 15, 1932, Serial No. 593,199

20 Claims. (Cl. 134—56)

1. A coating composition containing a drying oil having incorporated therein a positive oxidation catalyst and a controller of oxidation thereof comprising an aldehyde-amine condensation product or derivative thereof.

5. A coating composition containing a drying oil having incorporated therein an inhibitor of oxidation thereof comprising the reaction product of p,p'diamino diphenylmethane with beta naphthol.

2,099,238



WEARING APPAREL

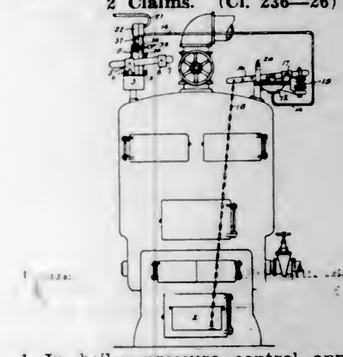
Alexander Simpson, London, England

Application March 13, 1936, Serial No. 68,675

In Great Britain July 8, 1935

1 Claim. (Cl. 2—237)

A garment of the kind referred to including a trunk- and limb-covering portion and a waist band, said trunk- and limb-covering portion and said waist band presenting a gap at the front side of the garment, a unitary panel of two-way stretch elastic material extending across and substantially filling said gap, means for attaching said panel to said trunk- and limb-covering portion, a flap on said trunk- and limb-covering portion adapted to cover said panel, a pair of straps attached to said flap one on each side of said flap, and a pair of buckles on said waist band for fastening said flap in position over said panel.



2,099,239

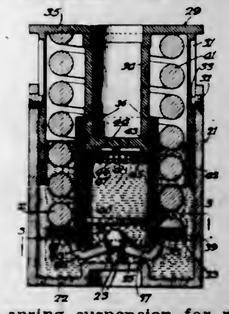
BOILER PRESSURE CONTROL APPARATUS

Jesse B. Snyder, Tacoma, Wash.

Application March 23, 1936, Serial No. 70,220

2 Claims. (Cl. 236—26)

1. In boiler pressure control apparatus, including a damper adapted to be opened and closed to control the boiler draft, comprising a boiler pressure-sensitive apparatus; an air motor connected to said damper and adapted to open it when compressed air is admitted thereto; an air control apparatus connected between a source of air pressure and the said air motor, said air control apparatus being provided with an air leakage orifice; and a pivoted finger adapted to normally close said leakage orifice, but adapted to be engaged by said pressure-sensitive apparatus to open said leakage orifice when the pressure reaches a predetermined normal in the pressure-sensitive apparatus.



2,099,240

BOLSTER SUPPORTING UNIT

Donald F. Sproul, Chicago, Ill., assignor to Cardwell-Westinghouse Company, a corporation of Delaware

Application December 31, 1934, Serial No. 759,817

9 Claims. (Cl. 267—4)

1. In a spring suspension for railway cars, a main cylinder for containing a liquid, an auxiliary cylinder within said main cylinder and containing a liquid, a spring surrounding said auxiliary cylinder and adapted to assist in supporting a car, and means including said spring for controlling the transference of liquid from said auxiliary to said main cylinder upon compression of said unit.

2,099,241

PACKING COMPOSITION

Hugh T. Stewart, Palmyra, N. Y., assignor to The Garlock Packing Company, Palmyra, N. Y., a corporation of New York

No Drawing. Application September 26, 1935, Serial No. 42,281

3 Claims. (Cl. 106—7.6)

1. A packing composition consisting of an intimate mixture of asbestos, graphite, powdered aluminum, lubricating oil, and dispersed compounded polychloroprene.

2,099,242

PACKING COMPOSITION

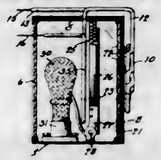
Hugh T. Stewart, Palmyra, N. Y., assignor to The Garlock Packing Company, Palmyra, N. Y., a corporation of New York

No Drawing. Application September 26, 1935, Serial No. 42,282

1 Claim. (Cl. 106—7.6)

A packing material for industrial use, having the following approximate composition:

	Per cent
Vulcanized binding material	7.0–12.5
Lubricating oil	5.0–10.0
Asbestos fibres	25.0–37.0
Powdered aluminum	14.5–18.5
Powdered graphite	28.0–44.0



2,099,243

ILLUMINATED SIGN

Thomas Taaffe, Los Angeles, Calif.

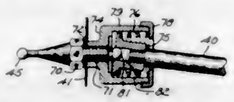
Application March 12, 1936, Serial No. 68,383

10 Claims. (Cl. 40—132)

1. An illuminated sign, comprising an opaque ground-plate having a translucent area delineating sign-characters, a luminous tube disposed in spaced relation forwardly of said plate forming sign-characters similar to and in axial symmetry with the sign-characters of said plate, a plurality of light-refracting elements positioned at the rear of said translucent area to refract light passing through said area, means to project colored light rays through said refracting elements to provide in said area a colored background for said tube, and means interposed between the source of said light rays and said elements to effect the constant movement of said rays upon said elements.

2,099,244

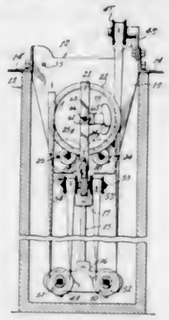
LEVER



Paul C. Temple, Decatur, Ill., assignor to A. W. Cash Company, Decatur, Ill., a corporation of Delaware

Application September 21, 1934, Serial No. 744,948

4 Claims. (Cl. 74—470)

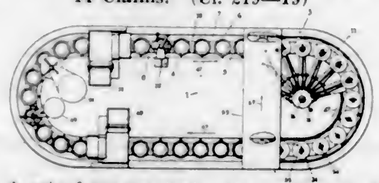


1. A lever formed in two parts located in substantial alignment and shaped to provide plane

cooperating surfaces perpendicular to the axis of the lever, a coiled compression spring surrounding one part of the lever and tending to maintain said surfaces in contact, and supporting means for

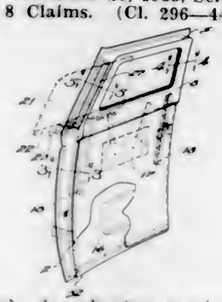
the spring carried by the other part of the lever and shaped to permit a substantial lateral tipping of one part of the lever relative to the other, whereby the lever will yield upon application of an excessive force thereto.

2,099,245
MOTION PICTURE FILM TREATING APPARATUS
Frederick B. Thompson, Hollywood, Calif.
Application July 21, 1936, Serial No. 91,710
16 Claims. (Cl. 271—2.3)



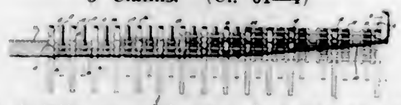
1. In a film treating apparatus, the combination of: a frame; a supporting member in said frame; a plurality of standards individually removably mounted in said supporting member; and a film supporting roller rotatably carried by each of said standards.

2,099,246
METAL TAPPING TOOL
Harry Raffles, Chicago, Ill.
Application March 27, 1937, Serial No. 133,352
1 Claim. (Cl. 145—61)



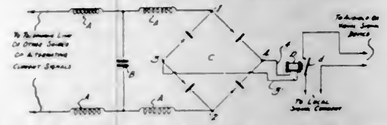
A tool of the character described comprising the combination of a tool-shank with a working end, the other end being blunt, a protective cap for said blunt end functioning as a blow-receiving member therefor, said cap being provided with a bore of such diameter that the blunt end of the shank may freely fit and slide thereinto, a rubber plug in said bore at the inner end thereof, and a rubber bumper on said cap.

2,099,247
PIE MAKING AND AUTOMATIC BAKING MACHINE COMBINED
Neil H. Whitlock, Indianapolis, Ind.
Application April 24, 1936, Serial No. 76,175
14 Claims. (Cl. 219—19)



1. A set of progressively arranged pie making mechanisms, a series of electrically operated ovens, chain means serving to move said ovens progressively to and from each of said pie making mechanisms, a means to make current connection with said ovens for a distance of their travel sufficient to maintain the baking time of each oven, a series of electrically heated oven lids carried by said ovens during the baking period, and a means serving to transfer said lids bypassingly in respect to said mechanisms, to the ovens as they reach the beginning of the baking period.

2,099,248
VEHICLE DOOR
Charles H. Widman, Detroit, Mich., assignor to The Murray Corporation of America, a corporation of Delaware
Application November 20, 1935, Serial No. 50,636
8 Claims. (Cl. 296—44)

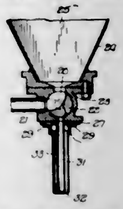


1. A vehicle door having a window opening therein, said window opening being of substantially greater width at the bottom than at the top, said door being formed to provide a slot in one of the jamb faces thereof, said slot communicating with said window opening, said slot being of substantially shorter length than the transverse width of said window opening.

2,099,249
JETTY
Sydney M. Wood, Lake Bluff, Ill.
Application June 30, 1936, Serial No. 88,179
5 Claims. (Cl. 61—4)

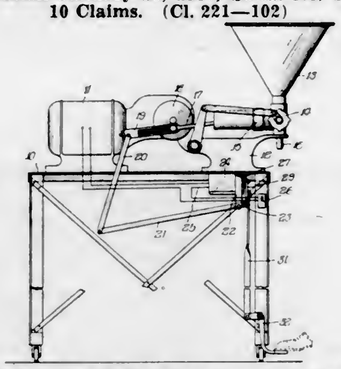
1. A jetty comprising an elongated wall extending outwardly at an angle to the shore, said wall comprising spaced upright members and superimposed horizontal members, said horizontal members being formed with interior apertures, and at least some of the upright members being of slightly less size than said apertures to extend through said apertures so that the horizontal members may be dropped into assembled position over said uprights, the cooperating upright members and apertures having at least one cooperating straight side, said cooperating straight sides fitting sufficiently close to one another to prevent turning movement of the horizontal members.

2,099,250
TELEPHONE SIGNAL SYSTEM
Lee E. Adler, Dallas, Tex.
Application May 25, 1936, Serial No. 81,611
3 Claims. (Cl. 179—84)



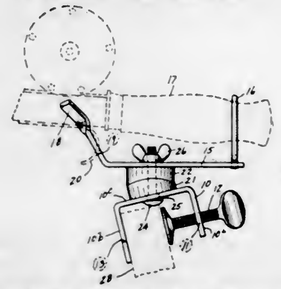
2. In a telephone system, a source of alternating current, an electrical signal controlling device, and means for selecting desired frequencies from said source of alternating current and changing the same to uni-directional or pulsating direct current to operate said signal controlling device, said means comprising parallel inductances directly cross-connected by a condenser, said inductances directly connected at one end to the source of alternating current and at the opposite end connected to a rectifier, said rectifier directly connected to the signal controlling device.

2,099,251
RAZOR
David E. Alport and Simon Alport, Kansas City, Mo., assignors to John W. Anderson, Gary, Ind.
Application May 13, 1932, Serial No. 611,182
10 Claims. (Cl. 30—87)



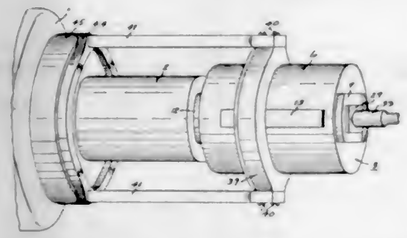
1. A razor including a cylindrical handle bar, a tie rod rotatable in and projecting from the ends of the bar, a stop member keyed to one end of the rod, and a blade carrier keyed to the opposite end of the rod.

2,099,252
FILLING MACHINE
Ralph B. Bagby, Evanston, Ill.
Application January 13, 1936, Serial No. 58,800
3 Claims. (Cl. 226—100)



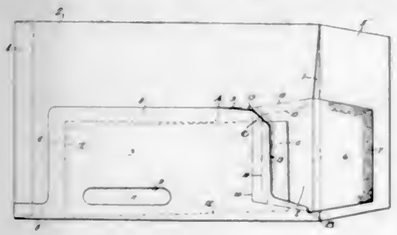
1. In a filling machine, the combination of a pair of cylinders, pistons therefor, means for effecting a simultaneous uniform stroke of said pistons, two segregated sources of supply of material, three-way-valve means for placing the sources of supply in communication with respective cylinders and said cylinders in communication with a divided outlet, and a filling nozzle at said outlet, said nozzle providing a tubular central passage for material from one cylinder and a surrounding tubular passage for material from the other cylinder.

2,099,253
TRIP MECHANISM FOR FILLING MACHINES
Ralph B. Bagby, Chicago, Ill.
Application January 25, 1937, Serial No. 122,109
10 Claims. (Cl. 221—102)



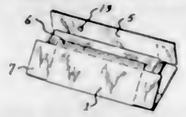
1. In a device of the class described, the combination with mechanism providing for reciprocating motion, of a motor for driving said mechanism, a motor switch, link mechanism connected to said switch and to said reciprocating mechanism, said link mechanism including a rocker, and means for shifting said rocker and breaking the link connection whereby to permit said switch to close.

2,099,254
FISHING ROD HOLDER
Charles W. Ballman, Indianapolis, Ind.
Application July 15, 1935, Serial No. 31,314
1 Claim. (Cl. 248—42)



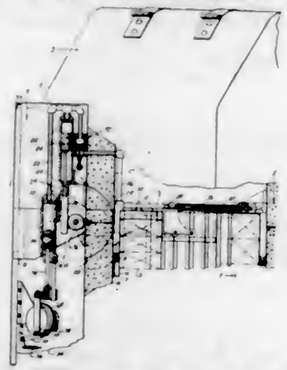
In a fishing rod holder having a rod engaging portion and means for clamping said holder to a supporting object, means interposed between said rod engaging portion and said clamp to provide for angular adjustment of said rod engaging portion, said means comprising a pair of disc-like members each having faces one perpendicular to its axis and the other at an angle thereto, said angular faces being in engagement with each other, whereby relative rotation of the discs varies the angle of the holder.

2,099,255
TAPERING ATTACHMENT FOR BORING MACHINES
Harold H. Bauer, Montgomery County, near Dayton, Ohio
Application September 4, 1936, Serial No. 99,434
8 Claims. (Cl. 77—58)



1. A boring apparatus having a jig borer head, a frame projecting axially from said head, a spindle rotatably and longitudinally movable in said frame, a shell secured to said spindle, a tool head transversely movable in said shell, a boring tool carried by said tool head, a ring supported by the frame and held against movement axially of the spindle, a cam bar pivotally secured at one end to the shell for contact with said ring through which it is forced by the spindle, and an adjustable connection between the free end of the cam bar and the tool head whereby, when the free end of said bar is forced inwardly by the ring while the shell passes therethrough, the tool head carrying the boring tool will be moved inwardly by said adjustable connection to produce a tapered hole.

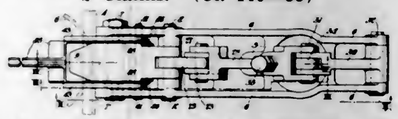
2,099,256
ENVELOPE
Anthony C. Benedict, Rockville Centre, N. Y.
Application November 15, 1934, Serial No. 753,074
7 Claims. (Cl. 229—72)



1. A duplex envelope having a generally oblong compartment, the latter having an end loading entrance which is substantially wider than the general width of the compartment whereby relatively easy loading is provided, said entrance being without communication with another compartment provided in the envelope and said entrance being arranged to cooperate to provide relatively easy loading of the former compartment with a continuation of the back wall of this compartment which extends in more than one direction outside from the entrance and serves as a guide to steer a suitably folded letter into said entrance.

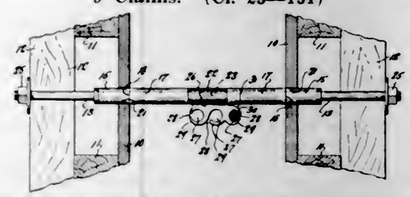
2,099,257
CONTAINER
Robert M. Bergstein, Cincinnati, Ohio, assignor to Edna May Bergstein and Robert Morris Bergstein, trustees
Application October 4, 1935, Serial No. 43,569
8 Claims. (Cl. 229—14)

1. A flat container construction in knocked-down form, designed to be squared up into box form, comprising an outer receptacle element and an inner element, the outer element being a tubular blank having closing flaps attached to the walls thereof by hinge lines, said inner element constituting an open-ended flat bag having no re-entrant angles and made of flexible material impervious on the inside at least, the closed end of the bag extending beyond the hinge lines adjacent to the flaps but unsecured to the flaps at one end of the outer receptacle, the walls of said flexible bag being adhesively secured to at least a plurality of the walls of the outer structure in such a manner as to cause the flexible bag to be pulled open upon squaring up the whole structure, the open end of the bag projecting beyond the hinge line thereof and unsecured to the closing flaps at the other end of the outer structure.



2,099,258
REFRIGERATED VENDING MACHINE
Russell H. Bird, Detroit, Mich.
Application May 3, 1934, Serial No. 723,765
5 Claims. (Cl. 312—64)

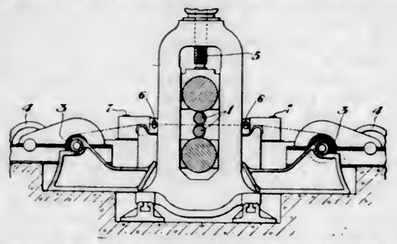
1. A vending machine adapted for dispensing package merchandise and used in combination therewith, comprising a suitable cabinet inclosure provided with an aperture in one side wall, a drum shaped door mounted for rotation in the aperture, said door being formed with a radial chamber, a multiple compartment merchandise package cage rotatably mounted within said cabinet inclosure positioned with the cage top opposite said side wall aperture, selective means mounted on said cabinet and attached to the cage capable of positioning any chosen cage compartment adjacent said side wall aperture, each compartment having means to urge the packages toward the cage top, automatic mechanical dispensing means mounted on the cabinet and adapted for ejecting



an article from a selected merchandise compartment into the radial chamber of the drum shaped door and for automatically opening and returning said door thereafter.

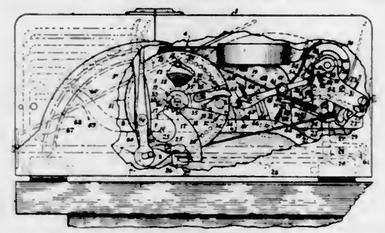
2,099,259
TOOL
Clarence O. Carlson, Cleveland Heights, Ohio, assignor to The American Steel and Wire Company of New Jersey, a corporation of New Jersey
Application February 27, 1936, Serial No. 66,136
2 Claims. (Cl. 140—55)

1. A tool for connecting an element to a second element having a deformable groove therein comprising, in combination, a stationary anvil providing a substantially flat contact surface, a pivoted die member for cooperation with said stationary anvil, means for supporting said elements against said stationary anvil with said first named element in the groove in said second named element, an operating rod, and means connecting said operating rod and said pivoted die member.



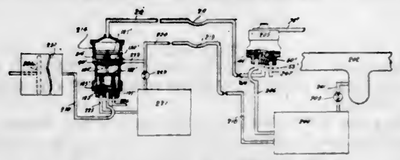
2,099,260
CONCRETE FORM AND REENFORCEMENT RETAINING MEANS
Samuel S. Colt, Orange, N. J.
Application April 27, 1936, Serial No. 76,580
9 Claims. (Cl. 25—131)

1. In concrete form retaining means, in combination, a tie rod engageable through opposed form walls, means mounted on said tie rod for engaging said form walls, a spacer element supported by said tie rod between said wall engaging means, a longitudinally extending flange laterally projecting from said spacer element, said flange having an opening through which a concrete reenforcing rod may be passed so as to be supported within the form interior preparatory to pouring concrete thereinto, and a bendable clamping finger connected with said flange contiguous to said opening and adapted to be bent into gripping relation to the reenforcing rod entered through said opening.



2,099,261
WIDE STRIP COLD ROLLING
Lawrence S. Dahl and John H. Shultz, Gary, Ind., assignors to American Sheet and Tin Plate Company, a corporation of New Jersey
Application July 19, 1934, Serial No. 736,128
3 Claims. (Cl. 80—60)

1. A method of cold working metal strip to a thinner predetermined gage, including working said strip primarily by pressure rolling to a thickness slightly greater than said gage, then applying sufficient tension to said strip to effect drawing and varying said tension as required to draw



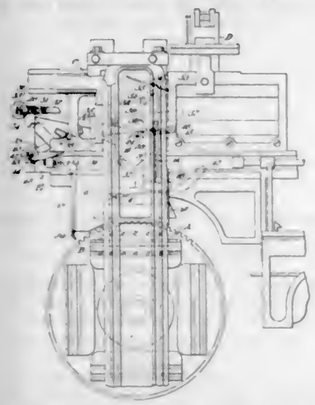
said strip to said gage, said tension being at all times sufficient to effect at least some drawing.

2,099,262
TYPEWRITING MACHINE
Charles W. H'Doubler and George I. Mills, Springfield, Mo.
Application April 10, 1935, Serial No. 15,591
8 Claims. (Cl. 197—65)

4. In a typewriting machine, in combination, a carriage adapted for advancement and retraction, spring actuated means for automatically advancing said carriage, a detent to restrain said spring induced advancement of the carriage, lever releasing means for disengaging the carriage from said detent, means including a duplex lever for retracting or advancing said carriage and common means adaptly supported on said duplex lever for operative engagement with said lever releasing means to disengage the carriage from said detent and maintain such disengagement while the carriage is being retracted or advanced by said duplex lever.

2,099,263
TRAILER BRAKE SYSTEM
Avad L. Farmer, Los Angeles, Calif.
Application August 20, 1934, Serial No. 740,546
30 Claims. (Cl. 303—26)

1. A remote control valve for a fluid pressure brake system, comprising a valve body having piston chambers separated by an intermediate partition, a pair of mechanically interconnected pistons, one working in each of said chambers, there being an intake port, an exhaust port, and a brake chamber port in the valve body communicating with the outer end of one of the piston



chambers, and an air port communicating with the inner portion of the other piston chamber through which the pressure on the inner side of the piston in said chamber can be controlled, means for maintaining a pressure on the opposite side of said piston, a pair of spring-closed valves controlling the intake and exhaust ports, and valve operating means moving with that piston which is in the valved piston chamber adapted to release both said valves to be closed by their respective springs throughout a limited extent of travel of said piston near the central portion of its stroke, to open the inlet port valve as the piston moves to the outer end of its stroke and to open the exhaust port valve as the piston moves to the inner end of its stroke.

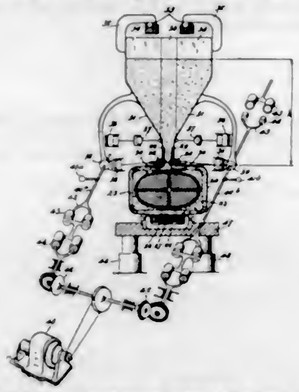
2,099,264

MOUTH WIPER FOR TYPESETTING MACHINES

Donald J. Fournet, Lafayette, La.

Application May 21, 1936, Serial No. 81,082
11 Claims. (Cl. 199—62)

1. A wiper for the vertically disposed mouth of the metal pot of typesetting machines, including a wiper element adapted to be advanced and retracted over the mouthpiece of said metal pot, means supporting said element for rectilinear reciprocating movement in operative relation to said mouthpiece, means for automatically moving said wiper element in both directions over said mouthpiece, and means operated in timed relation to the movement of the mold disk of the machine for controlling actuation of said automatic moving means, said automatic moving means operating independently of direct connection with the moving parts of the machine.



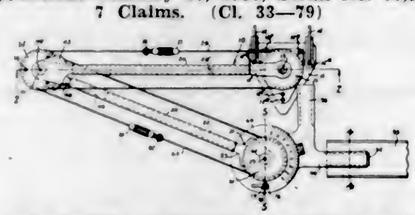
2,099,265

PROCESS FOR THE MANUFACTURE OF MOLDED PIECES FROM MORTAR OR CONCRETE

Eugène Freyssinet, Neuilly-sur-Seine, France

Application February 5, 1934, Serial No. 709,877
In France February 9, 1933
4 Claims. (Cl. 25—155)

1. A process of manufacturing hollow concrete articles which comprises pouring wet concrete into a mold, fluidifying said concrete in said mold by rapid vibration and simultaneously subjecting said liquid concrete to a pressure sufficiently low for permitting relative displacements of the particles of the concrete in the liquid mass, stopping the vibration when the concrete has become firm and finally subjecting said firm concrete in the



mold to a high pressure exerted from within the concrete mass.

2,099,266

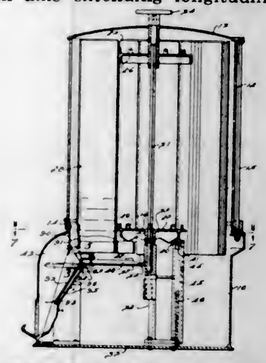
DRAFTING MACHINE

Russell H. Garner, Pasadena, Calif., assignor to Leonard N. Partch, Pasadena, and Russell H. Garner

Application January 27, 1936, Serial No. 60,993
7 Claims. (Cl. 33—79)

1. A drafting instrument comprising a base adapted to be secured to a drafting board, a post rigidly mounted on said base, a pulley on said post, said pulley having an external flange thereon, an arm, a pair of brackets each having a semi-cylindrical end portion fitted in said arm at one end, the other end of said brackets rotatably engaging said post, a second bracket on the other end of said arm, said bracket including a cylindrical portion fitted in the arm and rotatably engaging said second post, a pair of pulleys fixed on said second post, a third bracket engaging said second post, a second arm engaging said third bracket at one end, the other end of said second arm having a fourth bracket thereon, a third post rotatably engaging said fourth bracket, a pulley engaging said third post, an endless member passing over said first pulley and one of the pairs of pulleys, a second endless member passing over the other of said pair of pulleys and said third pulley, each of said endless members including an adjusting member, a scale member, a cup member engaging said scale member, means connecting said third pulley, said cup member, and said scale member, a scale base mounted on said post, said scale base having a pair of scale engaging members thereon.

2,099,267



VENDING MACHINE

Bernard A. Hackett, Detroit, Mich.

Application April 12, 1935, Serial No. 15,974
5 Claims. (Cl. 312—66)

1. In a vending machine, a stock carrier

mounted therein for rotation about a vertical axis and including a plurality of vertically arranged stock chutes, a reciprocable coin slide, and means including an ejector element pivoted to said slide about an axis extending longitudinally of said

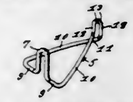
slide for dispensing articles of merchandise from a chute of said stock carrier, said ejector element being provided with downwardly inclined lateral margins for preventing interference with the rotation of said stock carrier.

2,099,268

PAPER HOLDER

West Henson and William Nelson, Jr., New York, N. Y.

Application August 26, 1936, Serial No. 98,012
1 Claim. (Cl. 242—107)



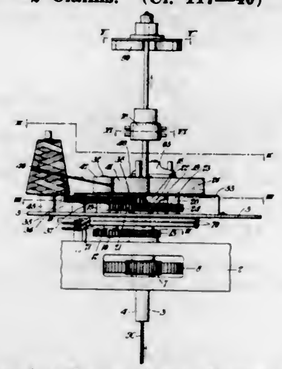
In a device of the character described, a paper holder comprising a cylindrical casing formed with a longitudinally extending slot, a bearing at one end of said casing, a block in the other end portion of said casing having a neck extending through the opening in the head of the casing, means to prevent rotation of the block in one direction, the block being formed with an axially extending bore, a stem rotatably received in the bore of said block and having its inner end formed with a clutch member, a paper roller extending longitudinally in said casing with one end journaled in said bearing and its other end formed with a clutch member for engaging the clutch member of said stem, a helical spring coiled about said stem within the bore of said block with one end anchored to the stem and its other end anchored to the block, a cap fitting about the outer end portion of said stem and held against rotation thereon, the neck of said block being formed with ratchet teeth, and pawls carried by said cap for engaging the ratchet teeth of said neck to hold the cap and stem against retrograde rotation when the cap and stem are turned in a direction to wind and tension said spring.

2,099,269

NECKWEAR DISPLAY CLIP

Roger K. Hoffman, Moscow, Idaho

Application February 3, 1936, Serial No. 62,186
5 Claims. (Cl. 223—1)



1. A clip comprising a substantially U-shaped portion adapted to straddle a shank of a support, overlapping resilient arms formed on the U-shaped portion, said arms capable of free sliding movement upon one another, and jaws formed on said arms and having their free ends bent in the direction of each other to grip opposite edges of a folded tie to retain the latter in a position to have the appearance of a tied tie.

2,099,270

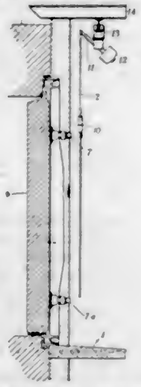
APPARATUS FOR COATING WIRE

Owen A. McNamee, Worcester, Mass.

Application November 25, 1936, Serial No. 112,832
2 Claims. (Cl. 117—40)

1. Apparatus for applying fibrous insulating material to an electrical conductor comprising a rotary head, said rotary head having an axial opening through which said electrical conductor passes, a spool of fibrous insulating material carried by said rotary head, carding means on said rotary head for applying said fibrous insulating material to said electrical conductor, means on said rotary head for assisting the removal of said fibrous insulating material from said carding means and onto said electrical conductor, driving means actuating said carding means during the rotation of said rotary head, and independent means for actuating said assisting means.

2,099,271



OPERATING DEVICE FOR USE IN CONNECTION WITH COKE-OVEN DOORS

Charles Craib Middleton and Reginald Frank Krall, London, England, assignors to Woodall-Duckham (1920) Limited, London, England, a British company

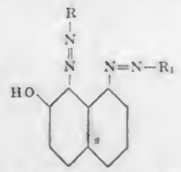
Application August 17, 1936, Serial No. 96,498
In Great Britain October 4, 1935
7 Claims. (Cl. 202—270)

1. In a coke oven having a door held in closed

position by upper and lower screws which lie in a common vertical plane parallel to the face of the door, the combination of means for releasing the upper screw comprising a support, a wrench carried by said support and suspended therefrom above the upper screw and in laterally spaced

relation with reference to the plane of the screws, means for connecting the wrench to the support so that it can be lowered into alignment with the top screw, said connection including means for simultaneously causing the wrench to approach the plane of the screws as it is lowered, and means for operating said wrench.

2,099,272



WATER-INSOLUBLE AZODYESTUFFS AND FIBER DYED THEREWITH

Heinrich Morschel, Leverkusen-Wiesdorf, and Felix Gund, Cologne-Deutz, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware

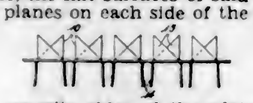
No Drawing. Application November 7, 1935, Serial No. 48,776. In Germany November 14, 1934

12 Claims. (Cl. 260—83)

1. Waterinsoluble azodyestuffs of the general formula:

wherein R stands for aryl and R_1 stands for a member selected from the group consisting of the radical of an arylamide of a β-ketocarboxylic acid and of an arylamide of an o-hydroxycarboxylic acid which has been coupled in o-position to the hydroxy group, yielding when produced on the fiber various shades of good fastness properties.

2,099,273



TIMBER CONNECTER

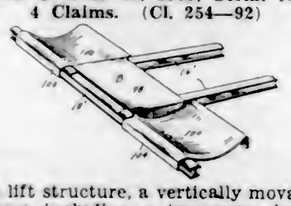
James E. Myer, Washington, D. C., assignor to Timber Engineering Company, Washington, D. C., a corporation of Delaware

Application October 5, 1936, Serial No. 104,133

4 Claims. (Cl. 20—92)

1. A timber connecter comprising: a plate; relatively thin flat right-angled triangular teeth projecting from each side of said plate; the altitude edges of said teeth extending perpendicularly to said plate, the flat surfaces of said teeth lying in parallel planes on each side of the plate; said

planes on opposite sides of the plate being directed so as to be parallel with the grain of the respective timbers to be connected.



2,099,274

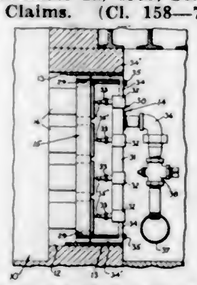
AUTOMOBILE LIFT

Don D. Myers, Toledo, Ohio, assignor to Modern Equipment Corporation, Defiance, Ohio, a corporation of Ohio

Application October 28, 1935, Serial No. 47,137

4 Claims. (Cl. 254—92)

1. In a lift structure, a vertically movable carriage frame including a transverse beam and free wheel rails and a saddle for support on said rails, said saddle having laterally extending flanges for engaging the wheels of an automobile, said flanges being dished in a fore and aft direction and resting on said transverse beam and being thereby reinforced against bending when under load.



2,099,275

GAS BURNER

Fred A. Nemec, Whittier, Calif.

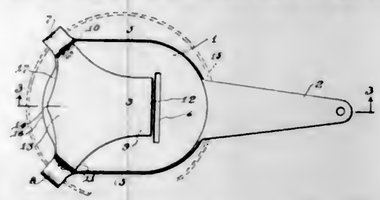
Application November 11, 1935, Serial No. 49,198

6 Claims. (Cl. 158—7)

1. A burner including a burner tube holder, said holder having a plurality of apertures therein, said apertures being slightly elliptical in shape and a plurality of tile burner tubes, each of said tubes comprising a substantially cylindrical body portion having an aperture therethrough, said body having an enlarged shoulder thereon terminating in an enlarged flange portion, said tube shoulder being slightly elliptical in shape, said tubes being mounted on said holder with said shoulders thereof positioned in said holder apertures and rotated to tightly engage the surfaces of said holder apertures.

2,099,276

EGG SEPARATOR



Thomas J. O'Connell, Flint, Mich., assignor of one-half to John W. Mestrezat, Flint, Mich.

Application June 11, 1936, Serial No. 84,749

3 Claims. (Cl. 146—2)

1. In a device of the class described, a spoon for separating the white from the yolk of an egg

comprising a receptacle provided with upstanding sides and a discharge mouth, a hook member protruding upwardly from each of said sides,

and a check means for retaining the yolk of the egg while the white is being discharged, said check being pivoted to said receptacle adjacent the discharge end thereof.

2,099,277

ANIMATED DISPLAY

Donald L. Peterson, Minneapolis, Minn.

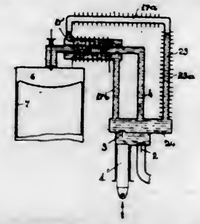
Application May 3, 1937, Serial No. 140,378

6 Claims. (Cl. 40—138)

5. In an animated display device, a base card element, a cooperating card element movable with respect to said base card, said movable card element being designed to simulate motion of a portion of said base card, an anchor plate, clincher elements connecting one of said card elements and said anchor plates, a connecter element comprising a box like structure having a flat base portion and a medial upstanding crimped portion, parallel side portions extending upwardly from said base portion, slide elements on said side portions and spaced from said base portion, a bracket plate, clincher elements securing said bracket plate to the other of said card elements, said slide elements being adapted to slide beneath portions of said bracket plate between said bracket plate and said card element to secure said box like connecter to said bracket plate, a crimped portion on said anchor plate, and a bar spring whose ends are rigidly secured in the crimped portions of said anchor plate and said box like connecter.

2,099,278

INTERNAL COMBUSTION ENGINE



Emil Schimanek, Budapest, Hungary

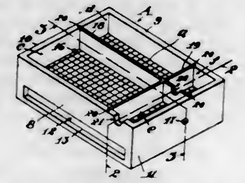
Application April 24, 1931, Serial No. 532,397

In Austria April 25, 1930

18 Claims. (Cl. 123—32)

1. A method of operating internal combustion engines with liquid fuel injection, particularly Diesel engines, comprising supplying liquid fuel to the engine under pressure, heating the liquid fuel while on its way to the engine cylinder under pressure through an interposed liquid between the source of heat and the liquid fuel to be heated, the said liquid forming the means of transmitting heat from the source to the fuel, regulating the heating of the fuel to be injected to maintain the temperature thereof intermediate its vaporization temperature under pressure before injection and its vaporization temperature at the lower pressure within the cylinder

to thereby maintain the fuel in the liquid state prior to its introduction into the cylinder and to provide sufficient heat in the fuel so that it is vaporized as a result of the heat contained therein when introduced into the cylinder at said lower pressure, and then injecting the fuel into the engine cylinder.



2,099,279

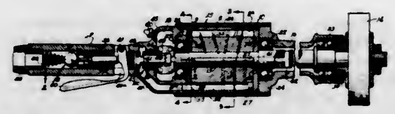
SOAP AND BRUSH HOLDER

Morris Schnider, Los Angeles, Calif.

Application September 15, 1936, Serial No. 100,878

4 Claims. (Cl. 132—79)

1. In a receptacle, a boxlike dish having a basin in the lower portion thereof and formed with a side wall drain opening spaced from the bottom and from the margin of the dish side wall, an apertured false bottom in said dish extending on a plane above said drain opening and below the margin of the side and end walls of the dish, and partitions separating the space above said false bottom into a plurality of article receiving compartments.



2,099,280

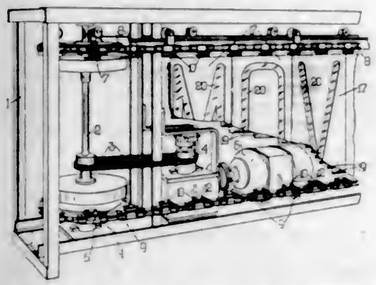
PORTABLE PRESSURE FLUID ACTUATED TOOL

Ernest H. Shaff, Grand Haven, Mich., assignor to William H. Keller, Inc., Grand Haven, Mich., a corporation of Michigan

Application October 21, 1933, Serial No. 694,525

13 Claims. (Cl. 121—34)

5. A portable tool having a rotary pneumatic motor including a cylinder, a rotor mounted eccentrically in said cylinder and adapted to be rotated by the force of fluid pressure, a pair of passages in the walls of said cylinder, one of said



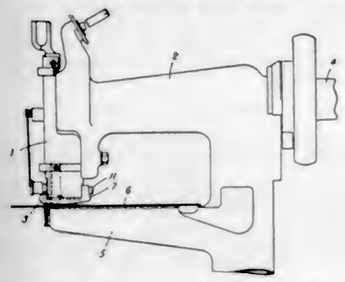
passages communicating with a source of pressure fluid and having ports communicating with the interior of said cylinder to direct the pressure fluid into operative engagement with said rotor, and the other of said passages communicating with a source of lubricant and having a port to the interior of said cylinder to direct lubricant to said rotor.

2,099,281

MOVING BAND FOR ADVERTISING AND THE LIKE DEVICES

George Stanley Shaw, Wallasey, England

Application February 18, 1936, Serial No. 64,593
In Great Britain March 13, 1935
3 Claims. (Cl. 40—32)



1. A display device comprising in combination a pair of endless flexible carrier elements, pairs of brackets disposed thereon at spaced intervals, a plurality of interchangeable display sign elements, fastenings on opposite ends of said display sign elements engaging alternate brackets of a pair, so that the end of one display sign element always overlaps the end of the next display sign element.

2,099,282

GUARD FOR MACHINERY

Ernest Smith, Manchester, England

Application October 20, 1936, Serial No. 106,680
In Great Britain November 12, 1935
3 Claims. (Cl. 74—612)

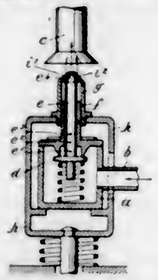
1. A guard for the reciprocating mechanism of the head of a machine of the stapling or stitching type, comprising a member having a recess opening through a face thereof to receive said head and snugly engage about the end thereof, said member having a passage therethrough within said recess through which the reciprocating mechanism of the head may operate, and means upstanding from said one face of the member whereby said member may be attached to said head.

2,099,283

TRACTION SPREADER

Hale W. Stevenson, Des Moines, Iowa

Application December 22, 1936, Serial No. 117,224
5 Claims. (Cl. 291—22)



1. The combination of a receptacle having a discharge, means for swingingly supporting the receptacle forwardly of and in close relation to a vehicle wheel, and means partially within the receptacle and engageable with the vehicle wheel for feeding material from said receptacle through said discharge onto a road bed and having measuring spaces regulating the quantity of material discharged.

2,099,284

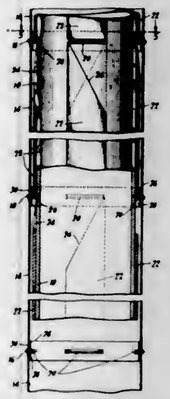
GAS VALVE CONSTRUCTION

Wilhelm Strelow, Berlin-Zehlendorf, and Max Strelow, Potsdam, Germany

Application January 8, 1936, Serial No. 58,168
In Germany May 23, 1935
4 Claims. (Cl. 251—115)

1. A gas valve construction comprising a gas chamber, a pipe through which gas is introduced into said chamber, an outlet from said chamber, a valve adapted to close said outlet, an external tubular guide mounted on said chamber wall and contiguous with said outlet, a hollow tubular member slidable within said guide towards the interior of said chamber by a distance determined by the travel of said valve in its opening motion, a cap on the upper end of said hollow tubular member, adapted to be depressed to press said cap against said hollow tubular member to displace said valve from said outlet, the wall of said hollow tubular member being apertured at the end adjacent said valve to form a communicating channel of cross sectional area varying with the sliding displacement of the tubular member.

2,099,285



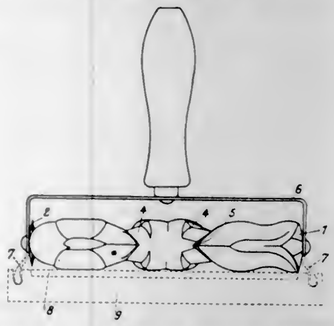
CONCRETE PILE MANUFACTURE

Maxwell M. Upson, Englewood, and Edward A. Smith, Chatham, N. J., assignors to Raymond Concrete Pile Company, New York, N. Y., a corporation of New Jersey

Application May 23, 1936, Serial No. 81,362
8 Claims. (Cl. 61—57)

1. In apparatus for forming a concrete pile, a drive core having sets of spaced-apart shoulders at intervals along its length, in combination with a pile shell comprising a plurality of rings each having a set of internal lugs, each lug being

adapted for engagement by one of a set of said shoulders, and each ring having a shell section



secured thereto and extending upwardly to engage the ring next above it.

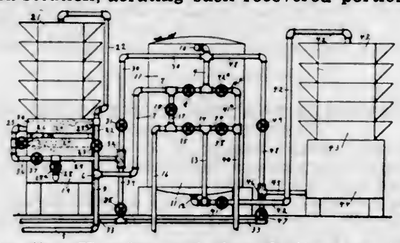
2,099,286

PASTE CUTTING ROLLER

Christian Usbeck, Steinbach-Hallenberg, Germany

Application November 1, 1935, Serial No. 47,818
In Germany November 7, 1934
1 Claim. (Cl. 30—306)

A paste cutting roller for cutting paste shapes without intervening spaces, comprising in combination a bow-shaped frame handle, a solid body loosely mounted in said handle, said solid body composed of an axial core, circular knives one at each end of said core, and cutter blades of irregular shape projecting from said axial core and extending one into the other along the entire length of the roller between said circular knives.



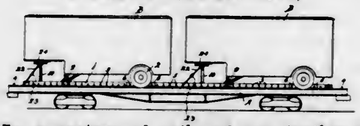
2,099,287

METHOD OF SOFTENING WATER

Clayton W. Woods, Burbank, Calif.

Application October 24, 1932, Serial No. 639,206
7 Claims. (Cl. 23—112)

5. In the art of water softening in which successive runs of hard water through zeolites are alternated with regenerations of said zeolites by bringing a sodium chloride regenerating solution into intimate contact with the zeolites whereby a base exchange is effected and the pH value of said solution is lowered, recovering a portion of said solution, aerating such recovered portion to



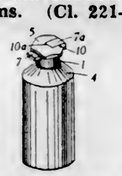
raise its pH value and thus further use in a subsequent regeneration.

2,099,288

RAILROAD CAR AND TRAILER COMBINATION APPARATUS

Edwin H. Allen, Edgerton, Wis., assignor to Highway Trailer Company, Edgerton, Wis., a corporation

Application November 29, 1935, Serial No. 52,268
7 Claims. (Cl. 105—368)



1. In a system of railroad car trailer transportation means of the class described, in combination, a car, guide members on the car for cooperation with the rear end supporting wheels of a trailer to guide the movement of the trailer longitudinally of the car, chocks carried by the car and having projections to interlock with the guide members, said guide members having openings at intervals in their lengths to receive said projections, and instrumentalities for connecting the front end of the trailer with the car, said instrumentalities cooperating with said guiding members and shiftable upwardly and downwardly for cooperation with the king pin at the front end portion of a trailer.

2,099,289

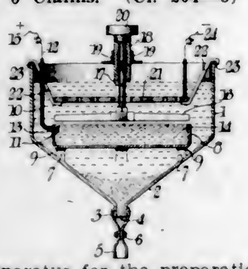
DELIVERY OR EXTRUSION NOZZLE DEVICE

Raymond Harvey Anderson, Thornton Heath, England

Application October 16, 1936, Serial No. 106,003
In Great Britain February 22, 1936
5 Claims. (Cl. 221—60)

1. A cap or nozzle for use on a container comprising a body part adapted to be fitted to a container, a slidable shutter-like closure member slidable transversely through the body part, an aperture in said slidable member between its ends normally covered by the top of the said body part, an opening in the top of the body part with which the aperture in the slidable member is brought into and out of registration by to and fro sliding movement of said slidable member, a pair of abutments on said slidable member, one

of which is near the aperture in the slidable member and normally engaged against an edge of said opening in the top of the body part, the other abutment serving as a stop to limit the opening sliding movement of the slidable member.



2,099,290

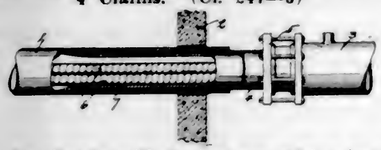
APPARATUS FOR THE MANUFACTURE OF MERCURY SULPHATE

Ronald J. Baird, Passaic, N. J., assignor to A. O. Smith Corporation, Milwaukee, Wis., a corporation of New York

Original application February 4, 1932, Serial No. 590,918. Divided and this application December 6, 1935, Serial No. 53,229

6 Claims. (Cl. 204—5)

1. An apparatus for the preparation of mercury salts comprising a container having sidewalls and a funnel-shaped bottom provided with closure means adapted to be opened for removing a portion of the salt formed, a shallow, non-conductive, acid-resistant vessel containing mercury as an anode supported near, but above the container bottom, and spaced from the container sidewalls, an insulated electrical conductor leading into the shallow vessel, an agitator positioned in close proximity to the shallow vessel for removing mercury salts from the vicinity thereof, a cathode positioned in the container, and a second electrical conductor leading to the cathode.



2,099,291

ELECTRIC CABLE SYSTEM

Charles E. Bennett, Ridgewood, N. J., assignor to The Okonite-Callender Cable Company, Incorporated, Paterson, N. J., a corporation of New Jersey

Application May 14, 1936, Serial No. 79,733

4 Claims. (Cl. 247—3)

1. An electric cable system comprising in combination a plurality of sheathed cable sections, an outer enclosure for the cable sections, a joint for the cable sections comprising an enclosing joint casing, the outer ends of the joint casing extending into the said outer enclosure and the cable sheath being expanded to unite the joint casing and said outer enclosure.

2,099,292

DRIPLESS DISPENSING DEVICE

Mortimer J. Brown, Niagara Falls, N. Y.

Application August 25, 1936, Serial No. 97,747

9 Claims. (Cl. 221—23)

1. A cover for liquid dispensing containers having a discharge means and a diametrically opposed air vent, said vent comprising inner and outer channels, the inner channel being shorter than the outer channel and meeting same at an angle, and the outer channel being arranged to

extend substantially vertically upward from the inner channel when the cover is in a pouring position and having no portion that slopes downward from the inner channel when the cover is in normal non-pouring position.

2,099,293

CHEMICAL COMPOUND AND USE THEREFOR

Willi Brun, Stratford, Conn., assignor to Remington Arms Company, Inc., a corporation of Delaware

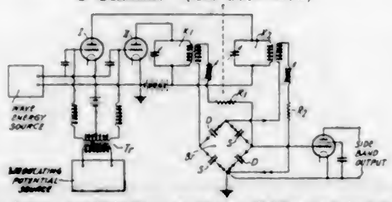
No Drawing. Application August 3, 1935, Serial No. 34,636

6 Claims. (Cl. 52—4)

1. A thallium salt of styphnic acid.

2. An ammunition priming mixture containing a thallium styphnate.

2,099,294



CARRIER WAVE MODULATION AND SUPPRESSION

Werner Buschbeck, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

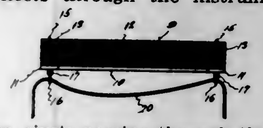
Application October 8, 1936, Serial No. 104,631

In Germany September 30, 1935

5 Claims. (Cl. 179—171)

1. In a modulation system of the carrier wave suppression type comprising a pair of electron discharge tubes of the multiple-electrode type and means for impressing wave energy to be modulated on like electrodes thereof and modulating energy on like electrodes thereof, a bridge circuit having four arms, a coupling between the output electrodes of one of said tubes and opposed points on said bridge, a coupling between the output electrodes of the other of said tubes and other opposed points on said bridge and an output circuit coupled to one arm of said bridge.

2,099,295



WRIST-TYPE MEMORANDUM PAD

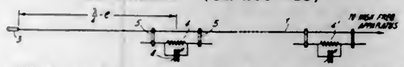
Dana W. Canfield, Chico, Calif.

Application July 24, 1936, Serial No. 92,426

2 Claims. (Cl. 281—1)

1. A wrist-type memorandum pad comprising a backing member of relatively rigid material formed at opposite ends with special adapter extensions, a memorandum pad composed of a plurality of individual memorandum sheets stacked upon one another and assembled on said backing member, said sheets being provided with anchoring tabs corresponding to said extensions, said tabs being connected with the body portions of the sheets through the instrumentality of

score lines, rivets passing through the respective sets of tabs and extensions, the rivets being of general U-shaped form and the free ends thereof being fashioned into retention eyes, and a pair of strap accommodation bails of general U-shaped form having the free ends of their arms provided with eyes hingedly connected with said first-named eyes.



2,099,296

APERIODIC ANTENNA

Philip S. Carter, Rocky Point, N. Y., assignor to Radio Corporation of America, a corporation of Delaware

Application December 23, 1933, Serial No. 703,801

10 Claims. (Cl. 250—33)

1. The combination with an open ended antenna adapted to function over a range of frequencies which is long relative to the wave length and whose radiating structure is devoid of concentrated reactance, of a power absorbing device in the form of a resistance shunting a portion of said antenna, said resistance being located at or near a point substantially an odd multiple of a quarter wave length of the mean frequency of said range from the open end, whereby said antenna is rendered substantially aperiodic over said range and substantially unidirectional in character.

2,099,297

PHOTOGRAPHIC MATERIAL AND PROCESS

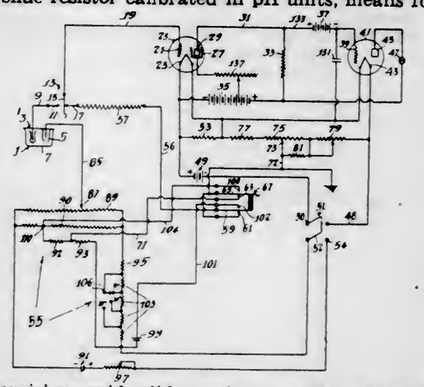
Louis Etienne Clément, Meudon-Val-Fleury, France, assignor, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey

No Drawing. Application June 23, 1936, Serial No. 86,775. In France June 24, 1935

2 Claims. (Cl. 95—6)

1. The method of producing photographic images which comprises exposing to the action of light a sensitive layer comprising a halogen-liberating compound and a polyvinyl compound the color of which is affected by the liberated halogen, developing the layer in an aqueous solution, and fixing the image in a solution of a solvent for the halogen-liberating compound.

2,099,298



ELECTRICAL TESTING APPARATUS

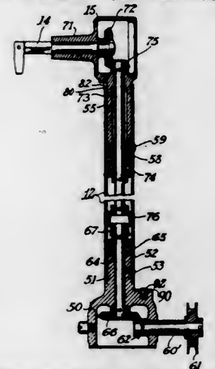
Henry E. Fracker, Pasadena, Calif., assignor to National Technical Laboratories, Pasadena, Calif., a corporation of California

Application September 21, 1935, Serial No. 41,603

14 Claims. (Cl. 175—183)

1. In a calibrated potentiometer for balancing the E. M. F. of and indicating directly at a plurality of temperatures the pH of a test cell, which cell has a constant potential other than zero at all said temperatures at one value of pH but which has a potential which varies linearly with temperature change at other values of pH, a slide resistor calibrated in pH units, means for

energizing said slide resistor, and calibrated means for electrically varying the scale vs. E. M. F. characteristic of said slide resistor to correspond to the pH vs. E. M. F. characteristics of the cell at different temperatures.



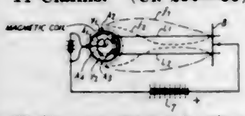
2,099,299

REEL MOUNTING FOR MOTION PICTURE PROJECTION APPARATUS

Edwin C. Fritts, Rochester, N. Y., assignor, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey

Application April 14, 1936, Serial No. 74,330

11 Claims. (Cl. 242—55)



4. In a motion picture projector the combination of a housing, a takeup reel mounted on said housing, a supply reel, means for movably mounting said supply reel on said housing to swing from a projecting to a rewinding position relative to said takeup reel, said means including a tube member, a supply spindle, a support for said spindle rotatably and slidably mounted in one end of said tube member, a power shaft for rewinding purposes extending into the other end of said tube member, and a drive shaft geared to said supply spindle and movable with the support therefor, said drive shaft adapted to alternately engage and disengage said power shaft as the spindle is rotated between its rewinding and projecting positions respectively.

2,099,300

OSCILLATION GENERATOR

Karl Fritz, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application May 7, 1936, Serial No. 78,306
In Germany May 9, 1935
11 Claims. (Cl. 250—36)

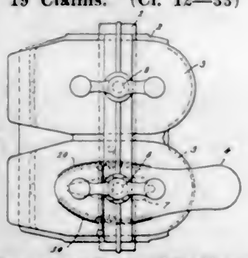
1. An oscillation generator having an electron discharge tube of the magnetron type, a linear cathode and a plurality of anodes in said tube, a magnetic field producing means adjacent said tube, conductors interconnecting certain of said anodes in pairs, a Lecher-wire system connected to said conductors, and tuning means such that a plurality of resonant conditions is provided by said Lecher-wire system in combination with portions of said conductors, thereby to determine one frequency of oscillations to be delivered by two certain anodes, one in each pair thereof, and to determine a different frequency of oscillations to be delivered by two other anodes, one in each pair thereof.

2,099,301

PAPER WRAPPER FOR COMMODITIES

Carl S. Hamersley, New York, N. Y., and Sumner C. Fairbanks, Passaic, N. J.; said Fairbanks assignor to said Hamersley

Application September 21, 1933, Serial No. 690,394
10 Claims. (Cl. 229—87)



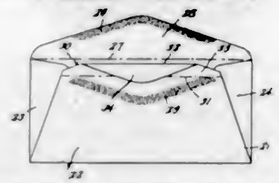
1. A waxed paper wrapper having along certain margins a coating of bonding material which is unreactive toward wax and of no appreciable normal viscidity, said material having a greater viscosity than wax and being substantially tacky at the melting temperature of wax.

2,099,302

PRESS FOR SOLING SHOES

Erik Algot Hammarsjö, Stockholm, Sweden

Application July 28, 1932, Serial No. 625,442
In Sweden May 18, 1931
19 Claims. (Cl. 12—33)



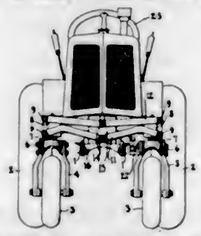
1. In a shoe press, the combination of a cushion support whereon to clamp the sole portion of a shoe, a last entered in the shoe for clamping purposes, means for applying clamping pressure to the last, a presser foot operated by the last mentioned means having a lower portion bearing on the last and an upper portion extending from the shoe, and welt clamping means acted upon by the upper portion of the presser foot to force the welt downwardly simultaneously with the application of clamping pressure to the sole portion.

2,099,303

SELF-SEALING ENVELOPE

William Hohwart, Woodside, N. Y.

Application May 13, 1937, Serial No. 142,362
7 Claims. (Cl. 229—80)



6. In an envelope, a rear wall and a front wall having a closure flap swingable to overlie the rear wall, complementary areas of dry sealing adhesive on the underside of the flap and the rear surface of the rear wall, and a protector flap of a size and normally disposed in active position for preventing contact of said adhesive areas, said protector flap having spaced transverse fold lines to permit of swinging movement of the same to an inactive position for exposing the adhesive areas for sealing contact.

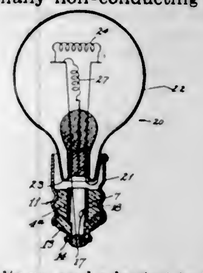
2,099,304

COMPENSATING WHEEL MOUNTING

Lionel J. Kepler, Dayton, Ohio

Application September 17, 1936, Serial No. 101,239
8 Claims. (Cl. 280—95)

1. A motor vehicle comprising, in combination, a chassis frame, a pair of levers pivoted to said frame and having vertically aligned pivots, a pair of wheel suspension blocks hinged respectively to the ends of said levers on vertically aligned pivots whereby said levers are adapted to move in parallelism in a substantially vertical plane, and a yoke suspended from the underside of each of said wheel suspension blocks at points inwardly from the ends of said pair of levers, said yokes having arms projecting downwardly and straddling a wheel journalled between said arms whereby the load supporting point of the vehicle is located above the axial center and above the periphery of the wheel.



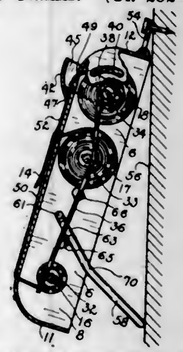
2,099,305

ELECTRICAL DEVICE

Alfred Lampl, Berlin, Germany, assignor to Norma Electric Corporation, New York, N. Y., a corporation of New York

Original application September 24, 1926, Serial No. 137,602. Divided and this application March 11, 1932, Serial No. 598,149. In Germany March 13, 1926
1 Claim. (Cl. 176—24)

An electric lamp comprising a base, a bulb attached thereto, a filament within the lamp having the ends thereof connected to the terminals of the base, a shunt within the lamp across said filament, normally non-conducting below a predetermined voltage, and adapted to become automatically conducting above said voltage, and a ballast resistance having one end embedded within said shunt and the other end thereof connected electrically to said filament.



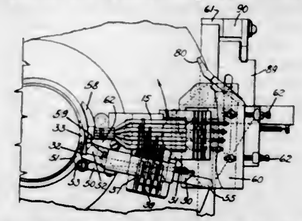
2,099,306

REGISTER

William Marshall, Seattle, Wash.

Application April 24, 1936, Serial No. 76,237
3 Claims. (Cl. 282—16)

1. In a device as described, the combination with a support having a writing surface provided with spaced transverse slots adapted to receive a web and having an auxiliary slot, a pair of reels mounted beneath said surface adapted for coaction with the opposite ends of the web, and means for revolving said reels, of an auxiliary reel mounted beneath said surface adjacent said auxiliary slot having a duplicating web thereon and one end of said duplicating web being attached thereto and the other end passing through said auxiliary slot and overlapping said first web, shearing means for said duplicating web pivotally mounted on said auxiliary reel, grooved collars and said reels, and means engaging said collars for releasably retaining said reels and for urging said shearing means to operating position.



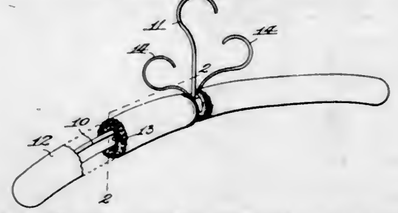
2,099,307

YARN-CHANGE FEEDING MECHANISM FOR CIRCULAR KNITTING MACHINES

Harry McAdams, Philadelphia, Pa., assignor to The Nolde and Horst Company, Reading, Pa., a corporation of Pennsylvania

Application February 10, 1936, Serial No. 63,233
7 Claims. (Cl. 66—140)

1. In a knitting machine having a circle of knitting needles and operative mechanism therefor, a yarn changing mechanism comprising, a plurality of yarn guides arranged to selectively feed yarn adjacent the outside of said circle of needles, an equal plurality of yarn clamping members movable across the needle circle and each having an operative connection to its respective guide for retracting said member by movement of its guide to non-feeding position, a clamping contact member adjacent the inner side of said needle circle, and a common yarn cutting device operative to release any retracted clamping member to advance and engage its severed thread against said contact member within the needle circle.

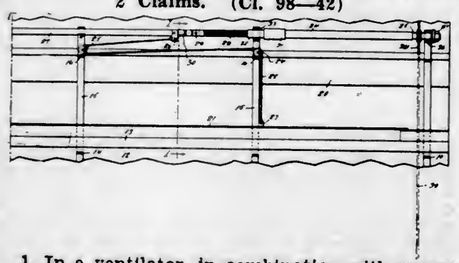


2,099,308

GARMENT HANGER SLIP-ON COVER

Johanna C. McAllister, Salt Lake City, Utah

Application December 8, 1936, Serial No. 114,773
3 Claims. (Cl. 223—98)



1. A slip-on cover for garment hangers comprising an inner tubular member of fabric adapted to receive one of the diverging arms of a garment hanger, an outer tubular member of fabric enclosing said first mentioned tubular member, said tubular members being closed at one end, the edges of the fabric tubes being secured to each other at the opposite end, and a filling of fibrous cushioning material between said tubular members.

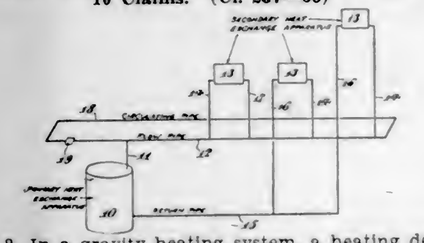
2,099,309

VENTILATOR

James H. McDerment, Cleveland, Ohio, assignor to The Swartwout Company, Cleveland, Ohio, a corporation of Ohio

Application August 21, 1935, Serial No. 37,195
2 Claims. (Cl. 98—42)

1. In a ventilator, in combination with means defining a horizontal opening to be closed, a horizontally disposed damper and means for moving



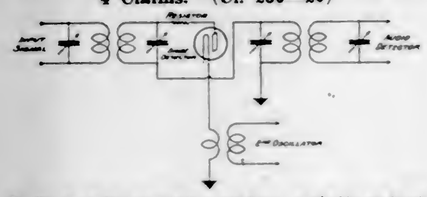
said damper vertically, parallel to itself, to and from closing relation to said opening, said last means comprising pulleys fixed with respect to said first means, one of said pulleys being spaced from another thereof laterally of said damper and one of said pulleys being spaced from another thereof longitudinally of said damper whereby the vertical projections of lines extending from each pulley to all the others will outline an area on said damper, flexible elements passing over said pulleys and extending vertically downwardly and connected to said damper whereby to suspend the same, an actuating element mounted for reciprocating movement longitudinally of said damper, said flexible elements being connected to said actuating element, remote control means for operating said actuating element and connecting means interposed between said actuating means and said remote control means and including mechanism for securing a mechanical advantage.

2,099,310

HEAT EXCHANGE SYSTEM

Frederick D. Mensing, Philadelphia, Pa.

Application February 3, 1934, Serial No. 709,560
10 Claims. (Cl. 237—63)



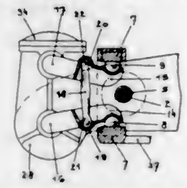
8. In a gravity heating system, a heating device for heating a liquid heat transfer medium, a heat emitting appliance, means, including a flow pipe, for conveying the heat transfer medium from said device to said appliance, a return pipe for conveying the heat transfer medium from said appliance to said device, a circulating pipe connecting the opposite ends of said flow pipe, and means in said circulating pipe for inducing circulation of said heat transfer medium through said flow pipe and said circulating pipe.

2,099,311

CIRCUIT FOR REDUCING STATIC

Madison G. Nicholson, Jr., Verona, N. J., assignor to National Union Radio Corporation, Newark, N. J., a corporation of Delaware

Application August 1, 1935, Serial No. 34,119
4 Claims. (Cl. 250—20)



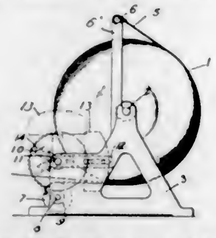
3. In a radio receiving system, a static reducing circuit, comprising a diode detector having a resistor in series, said detector being actuated by a radio frequency signal, an oscillator the frequency of which differs from the frequency of said signal by a super-audible frequency, and a radio frequency coupling device tuned to a frequency which is the resultant of the oscillator frequency and the frequency of said signal, said coupling device feeding an audio detector.

2,099,312

SPRING SUSPENSION OF INDEPENDENT CAR WHEELS, ESPECIALLY FOR MOTOR VEHICLES

Ferdinand Porsche, Stuttgart, Germany

Application January 25, 1932, Serial No. 588,719
In Germany August 10, 1931
5 Claims. (Cl. 280—124)



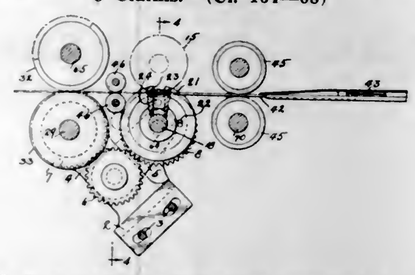
1. A wheel suspension particularly for motor cars, comprising a vertical member on which the wheel is mounted, a pair of supporting levers forming a four jointed link motion device with the member guiding it for oscillation in rigidly determined planes and having one end of each of the levers connected with invariable spacing of joints to one end of the member, a shaft secured at the other end of each of the levers, a single metallic spring secured to each of the shafts, and means for mounting said shafts with invariable spacing of axes on a frame of the car whereby the wheel will be elastically mounted relative to the frame, said spring being continuous and spirally coiled around each shaft and one end is secured to each shaft.

2,099,313

UNWINDING APPARATUS FOR PAPER WEBS AND THE LIKE

Adolph Potdevin, Garden City, N. Y., assignor to Potdevin Machine Company, Brooklyn, N. Y., a corporation of New York

Application October 8, 1935, Serial No. 44,000
1 Claim. (Cl. 242—75)



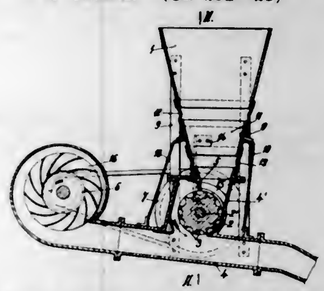
Unwinding apparatus for rolls of strip material, comprising in combination a frame, means for rotatably supporting a roll to be unwound on said frame, a belt having one end anchored to said frame above said roll and passing about the roll and contacting the periphery thereof, a drum having the other end of said belt secured thereto, a weight, a lever on which said weight is adjustably mounted, a gear for gearing said lever to said drum, said weight swinging in an arc by gravity concentric with said gear as the roll is unwound to wind the belt on said drum thereby uniformly to decrease the contact pressure of the belt on the roll periphery in direct proportion to the uniform reduction in the virtual diameter of the roll as unwinding proceeds, whereby maximum belt pressure is applied to the roll periphery when the roll diameter is maximum and minimum belt pressure when the roll diameter is minimum.

2,099,314

CUTTING-OFF MECHANISM FOR BAG MAKING MACHINES AND THE LIKE

Adolph Potdevin, Garden City, N. Y., assignor to Potdevin Machine Company, Brooklyn, N. Y., a corporation of New York

Application November 7, 1935, Serial No. 48,614
3 Claims. (Cl. 164—68)



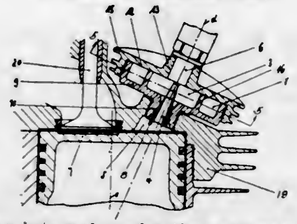
3. In a machine of the class described, a pair of forwarding rollers for continuously advancing tubing which is to be divided into bag lengths, a constant speed drive shaft for said rollers, a gear train between said drive shaft and said rollers, a pair of cut-off cylinders for severing the tubing into bag lengths, said cylinders making one revolution for each bag length, adjustable means intermediate the said constant speed drive shaft and said cut-off cylinders for transmitting power to the cylinders, variations in the said gear train effecting changes in the tubing speed without varying the speed of the said drive shaft, and adjustment of said adjustable means intermediate the drive shaft and cut-off cylinders maintaining the surface speed of the cut-off cylinders at tubing speed at the instant of cut-off throughout the said changes in speed of the tubing.

2,099,315

TRACK SANDING DEVICE

Karel Procházka, Dusniky, Czechoslovakia

Application February 2, 1937, Serial No. 123,639
In Czechoslovakia February 11, 1936
2 Claims. (Cl. 291—23)



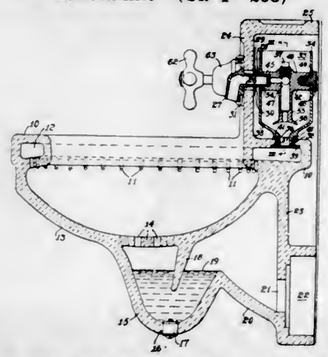
1. A track sanding device for motor vehicles comprising a tubular chute, a sand hopper superposed on and communicating with said chute, said hopper being divided in vertical direction into three sections, flexible connections uniting the three sections, rigid supporting connections between the chute and the top and bottom sections of the hopper, elastic supporting connections between the chute and the intermediate hopper section, a rotary sand feeding element mounted in the bottom section of the hopper for delivering sand into the chute, a driving shaft for said feeding element, means operated by said shaft for imparting a vibratory movement to the intermediate hopper section, and a fan communicating with the chute for discharging the sand from the latter.

2,099,316

PRECOMBUSTION-CHAMBER ENGINE

Karl Rabe, Stuttgart, Germany

Application June 24, 1933, Serial No. 677,446
In Germany June 27, 1932
14 Claims. (Cl. 123—32)



1. In an internal combustion engine, a cylinder comprising a combustion chamber, a precombustion chamber and an intermediate whirling chamber, said whirling chamber being of generally round form, having a generally flat top and bottom connected by an annular side wall and formed with a generally axial passage extending from near the center of one of said generally flat walls in a direction generally transverse to the generally flat top and bottom of the whirling chamber and into the combustion chamber and provided with at least one passage tangential to the side wall of said intermediate chamber and connecting with the precombustion chamber, whereby during compression air may flow from the combustion chamber through the intermediate chamber to the precombustion chamber with relatively low resistance but return flow will cause whirling in the intermediate chamber about its axis and in said passage from the intermediate chamber to the combustion chamber, and a fuel supply device for injecting a charge of fuel into said air for mixing therewith within said precombustion chamber or said intermediate chamber or said passages.

2,099,317

DENTAL LAVATORY

Victor E. Schmiedeknecht, Louisville, Ky., assignor to Standard Sanitary Manufacturing Company, a corporation of New Jersey

Application December 24, 1936, Serial No. 117,525
10 Claims. (Cl. 4—263)

1. A dental lavatory comprising a bowl having drain openings therein, a hollow rim superjacent

said bowl and provided with washdown openings communicating with said bowl, a trapway subjacent said bowl and communicating with said bowl via said drain openings, a discharge leading from said trapway, a spout operatively associated with said lavatory and means for irreversibly delivering water to said bowl irrespective of the conditions existing in said bowl and its associated water supply system.

2,099,318

PROCESS OF PREPARING RUBBER CONVERSION PRODUCTS

Lorin B. Sebrell, Silver Lake, Ohio, assignor to Wingfoot Corporation, Wilmington, Del., a corporation of Delaware

No Drawing. Application January 30, 1933, Serial No. 654,248. Renewed April 3, 1937

8 Claims. (Cl. 260—1)

1. A method of treating rubber which comprises dissolving it in an inert solvent, adding tin tetrachloride to the resulting cement, permitting the mixture to react at room temperature to form an addition product, splitting tin from the addition product under reducing conditions and drying in the absence of air.

2,099,319

GRIP, HANDLE, OR SHAFT OF PERCUSSIVE OR SWINGING IMPLEMENTS

David Mackintosh Shaw, Sydenham, London, England

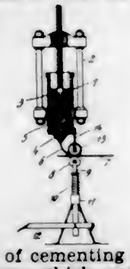
Application July 8, 1935, Serial No. 30,256

In Great Britain July 12, 1934

4 Claims. (Cl. 273—81)

1. A grip for the shafts of bi-manual percussive or swinging implements comprising an implement shaft, a tubular grip sleeve or hollow handle cover of substantially greater diameter than said shaft and of a length to be grasped by both hands of the user adapted concentrically to encircle said shaft and means for rigidly attaching said grip sleeve only about the center of the length of said sleeve to said shaft.

2,099,320



METHOD OF UNITING CURVED BODIES INCLUDING BOOTS AND SHOES

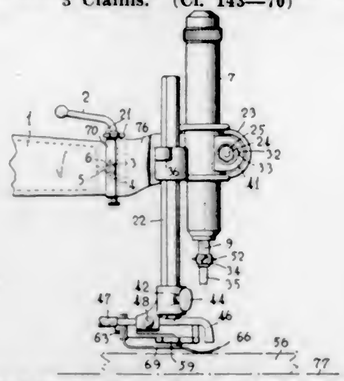
Willy Stelkens, Cologne-on-the-Rhine, Germany

Application January 22, 1934, Serial No. 707,763

In Germany January 26, 1933

2 Claims. (Cl. 12—142)

1. The method of cementing the sole of a boot or shoe to the vamp which comprises depositing a cord of a semi-solid cement along the marginal portion of one of the parts to be united, exerting pressure on said cord to flatten same, applying to said cord a solvent to cause the cement to swell and become tacky, bringing the part with the cement covering its marginal portion in contact with the marginal portion of the other part, and uniting said portions by applying pressure.



2,099,321

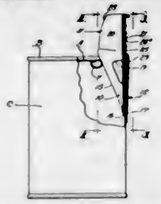
SCROLL SAW

Herbert E. Tautz, Milwaukee, Wis., assignor to Delta Manufacturing Company, Milwaukee, Wis.

Application May 22, 1935, Serial No. 22,824

3 Claims. (Cl. 143—70)

1. In a mechanism having a frame and a guiding head for a mechanically driven device, means for releasably securing the head to the frame, comprising cooperating dovetail members carried by the frame and by the head respectively and means for latching said dovetail members to one another, said latching means comprising a rotatable and vertically adjustable cam and a stop preventing excess rotation of the cam, so that when the cam is in proper position to release the dovetail members from one another, the stop will automatically prevent further rotation in the releasing direction, said cam having an actuating handle at its upper end, a member projecting downwardly from the cam and means cooperating with said downwardly projecting member for adjusting the position of the cam in a vertical direction.



2,099,322

MEANS FOR OPENING CONTAINERS

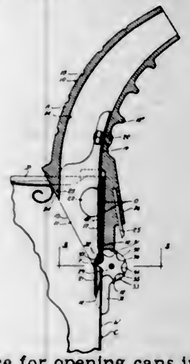
Ozro N. Wiswell, Los Angeles, Calif.

Application June 28, 1933, Serial No. 678,063

24 Claims. (Cl. 221—23)

1. A device for opening containers including, a cutter of substantially U-shaped cross section operable to cut an opening in the container and adapted to project from the container to form a spout therefor, and a member in connection with the cutter for engaging a wall of the container to guide the cutter to make the opening in an end of the container immediately adjacent its line of

joinder with said wall, the member being approximately the same width as the cutter, there being an opening in the cutter to allow for the drainage of liquid from between the cutter and said wall.



2,099,323

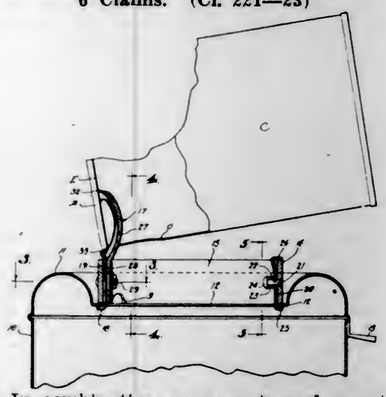
DEVICE FOR OPENING CANS

Ozro N. Wiswell, Los Angeles, Calif., assignor to Swingspout Measure Company, Los Angeles, Calif., a corporation of California

Application July 14, 1934, Serial No. 735,258

18 Claims. (Cl. 221—23)

14. A device for opening cans including a body comprising a spout, and a guide for engaging the side wall of a can, a cutter on the body adapted to cut a pouring opening in an end of the can, means on the guide for cutting an opening in the side wall during actuation of the cutter, and means associated with the cutter for closing the last mentioned opening until the cutter is removed from the can.



2,099,324

DEVICE FOR OPENING CANS

Ozro N. Wiswell, Los Angeles, Calif., assignor to Swingspout Measure Company, Los Angeles, Calif., a corporation of California

Application January 2, 1935, Serial No. 69

6 Claims. (Cl. 221—23)

1. In combination, an open topped receptacle having an inwardly projecting flange at its upper end, and a device for opening cans including a body to be arranged on the flange, a projecting cutter carried by the body, and means for attaching the body to the receptacle including a latch on the body for engaging under the flange.

2,099,325

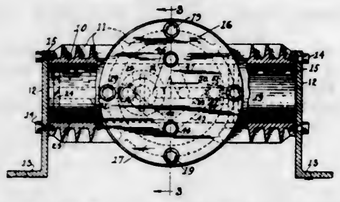
PROCESS FOR THE MANUFACTURE OF REACTIVE THORIUM OXIDE AND ITS TRANSFORMATION INTO THORIUM SALTS

Rudolf Zellmann and Richard Müller, Radebeul, Germany, assignors to Chemische Fabrik von Heyden, A. G., Radebeul, near Dresden, Germany, a corporation of Germany

No Drawing. Application June 19, 1933, Serial No. 676,532. In Germany June 22, 1932

8 Claims. (Cl. 23—16)

1. Process for the manufacture of thorium oxide very capable of reaction and its transformation into thorium salts, which consists in heating thorium oxalate at temperatures below 500° C. and heating the thorium oxide obtained with acids until the salt is formed.



2,099,326

PUMP OR COMPRESSOR

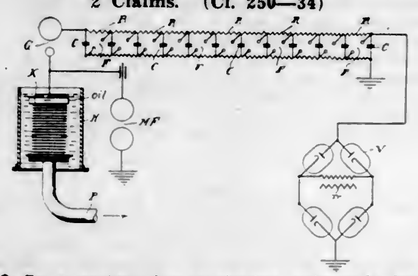
Howard L. Bancroft, Sharpsville, Pa., and Horace S. Smith, Hubbard, Ohio

Application August 18, 1936, Serial No. 96,636

8 Claims. (Cl. 103—157)

1. In a device of the character described, a cylinder closed at one end, a piston movable in said cylinder with a compound oscillating and longitudinal motion, means for imparting said motion to the piston, said piston having a passage extending from the extremity thereof to a port in the side thereof, a valve piece formed to fit the side of the piston in the vicinity of its said port, said valve piece having an intake and an exhaust port adapted to register at proper times with the piston port as it moves in its curved path, and means for holding the valve piece against the piston to provide an effective seal.

2,099,327



APPARATUS FOR PRODUCING EXTREMELY FAST CORPUSCULAR RAYS

Arno Brasch and Fritz Lange, Berlin, Germany

Application October 5, 1933, Serial No. 692,338

In Germany July 23, 1929

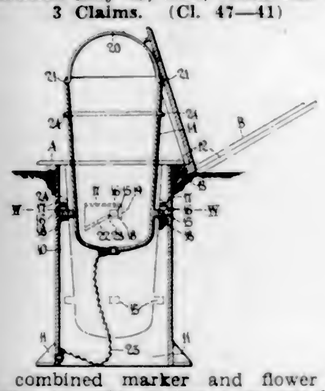
2 Claims. (Cl. 250—34)

2. In a system for producing extremely hard X-rays, an X-ray tube, several spark gaps, condensers and resistances, the spark gaps and condensers being alternately connected in series and each condenser and adjacent spark gap being

bridged by a resistance, means for charging said condensers connected to one end of the series and means for discharging said condensers connected to the other end of the series and to the tube, said latter means including a spark gap so dimensioned as to break down at voltage much higher than the charging voltage for the single condensers.

2,099,328

METHOD OF HARDENING SOIL



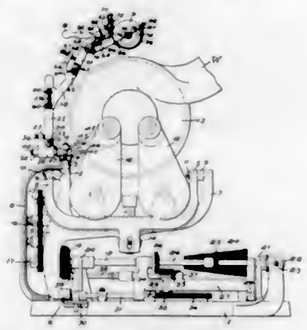
Leo Casagrande, Berlin-Charlottenburg, Germany
No Drawing. Application January 7, 1935, Serial No. 736. In Germany January 16, 1934
14 Claims. (Cl. 204—1)

1. A method of hardening soils containing colloidal clay that comprises introducing two electrodes into the soil and connecting the electrodes by a conductor, one of the electrodes containing aluminum, and the other electrode being more electropositive, and supplying an aluminum compound to the soil surrounding the aluminum electrode.

2,099,329

COMBINATION GRAVE MARKER AND FLOWER HOLDER

Millard Comstock and Herbert C. Schoepflin, Buffalo, N. Y., assignors to Ornamental Specialties, Inc., Buffalo, N. Y.
Application May 19, 1936, Serial No. 80,540
3 Claims. (Cl. 47—41)



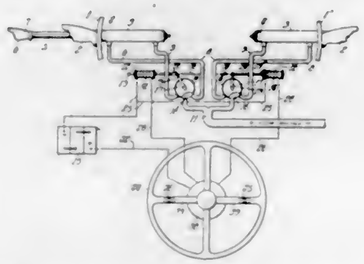
1. A combined marker and flower holder comprising an outer casing, a receptacle movable up and down therein and a cover member hinged to and adapted to close the top of the casing, means on the inner wall of the casing and means on the outer wall of the receptacle designed for lateral interengagement for supporting said receptacle in an elevated position, whereby said receptacle may be manually raised to its elevated position, with the means on the casing and the means on the receptacle in relative radial misalignment, and then rotated with respect to said casing to bring said means into engagement for supporting said receptacle.

2,099,330

FORMING APPARATUS FOR WOOL HAT AND OTHER TUBULAR FELT BODIES

George J. Corporon, Newburyport, Mass., assignor to Merrimac Hat Corporation, Amesbury, Mass., a corporation of Massachusetts
Application August 6, 1936, Serial No. 94,625
9 Claims. (Cl. 19—149)

1. In a felt-body forming apparatus for hat and like bodies, said apparatus including a rotatable former supported for horizontal swinging movement, in combination therewith, a rotary cutter having operative and inoperative positions relative to said former, means coaxial with the axis of swinging movement of said former for



rotatably supporting the cutter to swing with said former, and means carried by said supporting means for rendering said cutter operative or inoperative at the will of the operator and indifferently during a swinging or non-swinging status of said former.

2,099,331

DIRECTION SIGNAL

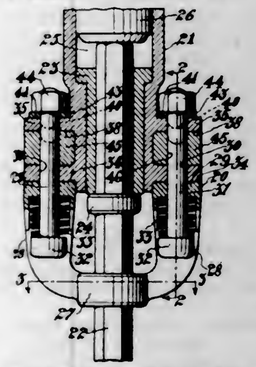
Benjamin A. Crenshaw, deceased, late of Chicago, Ill., by Thomas C. Crenshaw, executor, Chicago, Ill., assignor, by mesne assignments, to Steve Kalisz, Chicago, Ill.
Application August 26, 1935, Serial No. 37,899
1 Claim. (Cl. 177—329)

The combination with the pneumatic-pressure causing means of an automobile, of a signal, a piston to project it, a cylinder for the piston, two pipes, one extending from each end of said cylinder, a valve whose throw in one direction connects one pipe to the area subject to pneumatic pressure and excludes the other and whose throw in the opposite direction connects the latter pipe and excludes the former, and the combination with the electricity producing means of the automobile, of an electric circuit having an opening and closing switch and a spring-opposed electromagnet combined with the combination, first stated above and characterizing it by the fact that it controls the valve of said combination so that when the said circuit is closed the electromagnet operates the valve to project the signal by pneumatic pressure and when the circuit is opened the spring reverses the position of the valve and causes pneumatic-pressure to retract the signal.

2,099,332

REVERSIBLE HANGER MOUNTING FOR PICTURES AND THE LIKE

Camillo Di Nuccio, Providence, R. I., assignor of one-half to John Bevilacqua, Providence, R. I.
Application March 7, 1936, Serial No. 67,657
3 Claims. (Cl. 248—28)

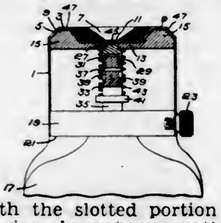


1. In a picture hanger device, a plate having a nail shank receiving opening, the lower portion of the plate having two resilient arms extending upwardly from the edge thereof with their adjacent edges angularly disposed with relation to each other to provide a guide passage for a nail shank, the edge of said opening opposite the guide passage being formed as a seat, the upper portions of said arms normally closing said shank receiving opening to a nail shank but being movable by pressure of a nail shank on said adjacent edges to permit movement of the nail shank past said upper portions and into said opening for positioning in said seat.

2,099,333

IMPLEMENT RETAINER

George H. Fuehrer, Phillipsburg, N. J., assignor to Ingersoll-Rand Company, Jersey City, N. J., a corporation of New Jersey
Application June 26, 1937, Serial No. 150,519
2 Claims. (Cl. 121—32)



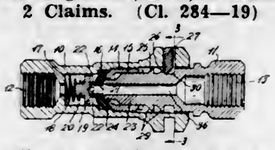
1. In an implement retainer for percussive tools, the combination of a casing and a working implement in the casing, a retainer for retaining the working implement in the casing, hollow trunnions on the casing having diametrically opposed elongated apertures therein, bolts for clamping the retainer against the trunnions and being swingable in the apertures, and means rotatable in the trunnions forming bearings for the bolts.

2,099,334

SHAVING DEVICE

John B. Gormley, Boston, Mass.
Application July 1, 1936, Serial No. 88,376
10 Claims. (Cl. 30—43)

1. A shaving device having, in combination, a skin contacting member formed to present a thin walled annular part having a face portion and an outer side wall inclined outwardly of said face portion, said face portion and wall provided with narrow closely spaced slots to form a comb and a plurality of hair shearing elements, and a movable member within said skin contacting member

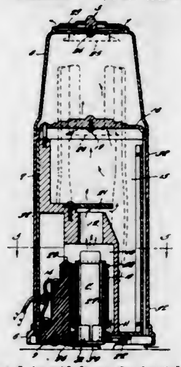


contacting with the slotted portion thereof to provide a shearing element cooperating with the first mentioned shearing elements.

2,099,335

HOSE COUPLING

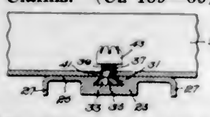
Fred E. Hansen, Lakewood, Ohio
Application August 28, 1935, Serial No. 38,193
2 Claims. (Cl. 284—19)



2. A coupling comprising two tubular members adapted to be arranged in telescoped relation, one of said members having an internal annular abutment, a gasket seated against said abutment and a threaded ring for securing said gasket in place, the other of said members having an end adapted to seat against said gasket when said members are in coupled relation, the second mentioned member having a plurality of beveled annular collars thereon forming abutments, and the first mentioned member having releasable spring-actuated detent means engageable with either of said abutments to retain said members in different coupled arrangements, said detent means being arranged to be automatically moved to the released position by said collars when said tubular members are forced together into telescopic relation.

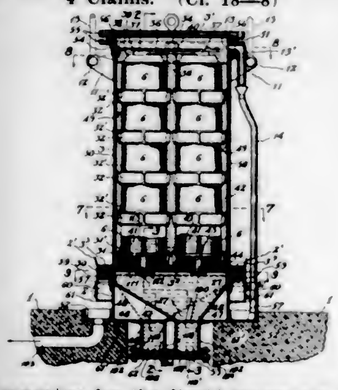
2,099,336

COMBINED TOOTH BRUSH HOLDER AND STERILIZER



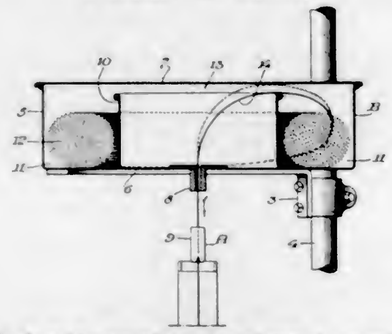
Fred E. Hart, Los Angeles, Calif.
Application September 30, 1936, Serial No. 103,466
1 Claim. (Cl. 21—85)

In a combined toothbrush holder and sterilizer comprising a base, a body portion secured to the



base, a fume chamber within the body portion, an electric heating element chamber within the fume chamber and communicating therewith, a deflector over the port between the aforesaid chambers, a cover over the fume chamber and having brush receiving apertures and fume exit ports therein, a top over the cover, a ventilator in the top, a tubular electric heating element in the heating element chamber, a block removably secured to the base in spaced relation thereto and removably supporting the heating element, said block having an aperture therein, a resilient cup removably disposed in the opening of the block, a cartridge removably seated in the cup and extending into the tubular heating element, means securing the tubular heating element to the block, means removably securing the cup within the opening of the block, and an electric circuit connected to the heating element.

2,099,337
BUILDING CONSTRUCTION
Russell L. Hohl, New York, N. Y.
Application March 5, 1936, Serial No. 67,248
10 Claims. (Cl. 189—85)



8. A supporting structure comprising a furring strip or the like of extruded metal shaped to provide a longitudinally extending groove adapted slidably to receive and retain the head of a fastener member, the lateral surface of which head is a surface of revolution, and slidably engaging cooperating means on said fastener member and strip to prevent turning of said member.

2,099,338
APPARATUS FOR THE LIQUID-TREATMENT OF FINE FILAMENTOUS THREAD
Charles A. Huttinger, Lakewood, Ohio, assignor to Acme Rayon Corporation, Cleveland, Ohio, a corporation of Ohio
Original application May 5, 1934, Serial No. 724,113. Divided and this application April 7, 1936, Serial No. 73,144
4 Claims. (Cl. 18—8)

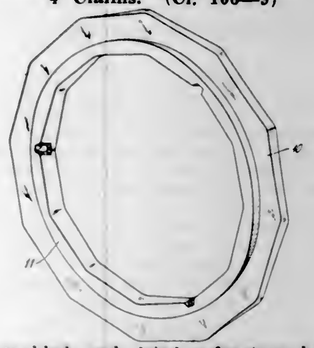
1. Apparatus for the liquid-treatment of fine filamentous thread comprising a fixed working base, a treatment tank having ports, supported by the base and adapted for the support and housing of a plurality of thread packages, a liquid-distributing manifold mounted in the base and comprised of two series of alternate differentially inclined pairs of converging plates, wall members between adjacent pairs of plates forming two series of alternate chambers, some of the ports of the treatment tank communicating with one series of manifold chambers and the other ports of the treatment tank communicating with the other series of manifold chambers, said base being formed with ports opening into said two series of manifold chambers.

2,099,339
WIRE CONTAINER
Albert N. Joley, Springfield, Mass., assignor to The Diamond Match Company, Wilmington, Del., a corporation of Delaware
Application June 20, 1936, Serial No. 86,298
5 Claims. (Cl. 242—103)

1. A wire container comprising a receptacle having a fixed bottom provided with a centrally disposed wire egress portion, an upstanding barrier member supported by said bottom and affording with the receptacle a chamber for the reception and retention of a ring of coiled wire, the upper edge of said member providing a circular support for the wire in its passage from the coil to and through the egress portion, said support being of relatively large diameter when compared with the diameter of the egress portion.

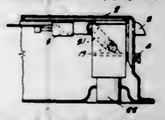
2,099,340
PROCESS OF ENAMELING
Karl Kautz, Massillon, Ohio, assignor to Republic Steel Corporation, Youngstown, Ohio, a corporation of New Jersey
No Drawing. Application June 28, 1934, Serial No. 732,895
2 Claims. (Cl. 91—73)

1. In the process of enameling ferrous sheet metal those steps comprising heating the metal in an oxidizing atmosphere to form a smooth, firm oxide scale thereon, heating the oxidized metal in a reducing atmosphere to remove the oxygen and provide a layer of carbon free iron on the base metal, thereafter working the metal to the desired texture and shape, and enameling directly to the prepared surface of the base metal whereby an improved bond results with an absence of reboiling.



2,099,341
COLORED CELLULOSE ESTER SHEETING
William O. Kenyon and Russel H. Van Dyke, Rochester, N. Y., assignors, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey
Application February 9, 1935, Serial No. 5,798
2 Claims. (Cl. 91—68)

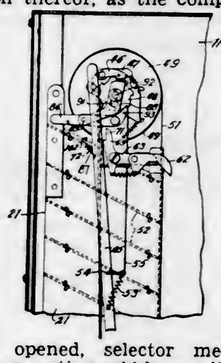
1. A thin, flexible, substantially transparent cellulose ester wrapping material which is moisture-proof and capable of permanently retaining water-soluble adhesives which comprises a cellulose acetate base sheet coated on at least one surface



with a water-insoluble dicarboxylic acid ester of cellulose having a free carboxyl group in its molecule and a basic dye chemically united to the dicarboxylic acid ester.

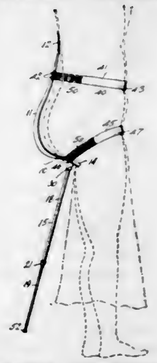
2,099,342
REFRACTORY
Robert G. Lemmerman, Lakeline, Ohio, assignor to The Ferro Engineering Company, Cleveland, Ohio, a corporation of Ohio
Application June 29, 1934, Serial No. 733,087
4 Claims. (Cl. 106—9)

1. A molded and dried refractory having a water glass binder, said refractory comprising shale burned to provide porosity and an aggregate chemically inert to the water glass, said shale and aggregate constituting together from 90% to 99% by weight of the entire refractory.



2,099,343
DOOR LOCK
Robert Buchanan McFarlane, Toronto, Ontario, Canada
Application August 14, 1936, Serial No. 95,977
13 Claims. (Cl. 70—147)

1. In a door lock, a slidable bolt, a bolt retracting element movable inwardly from the face of the door to retract the bolt, and resilient door opening means supported by the door jamb and against which the bolt retracting element presses when moved inwardly to retract the bolt.

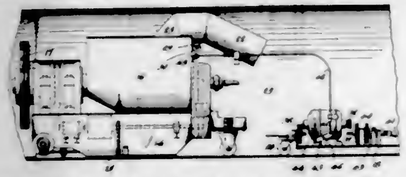


2,099,344
SELECTIVE VENDING MACHINE
Bert E. Mills, Oak Park, Ill., assignor to Mills Novelty Company, Chicago, Ill., a corporation of Illinois
Application July 15, 1933, Serial No. 680,611
7 Claims. (Cl. 312—95)

1. A selective vending machine comprising a plurality of tiers of open front compartments, a curtain for each tier adapted in its initial position to close all of the compartments thereof, an operating lever, means operable by said lever for moving a selected one of said curtains to open one of the compartments of a selected tier upon each actuation of the machine, said means including a device for winding up said curtain, or an extension thereof, as the compartments are

successively opened, selector mechanism for operatively connecting said lever with the curtain operating means for any selected curtain, and means for causing unwinding of the curtain to close the compartments for reloading.

2,099,345
BODY SUPPORT OR STOOL
Peter A. Olszanowski, Buffalo, N. Y.
Application January 6, 1937, Serial No. 119,244
3 Claims. (Cl. 155—37)



1. A body support comprising a seat member, a back rest rising from the rear of the seat member, leg engaging strap means extending from the seat member, waist engaging strap means extending from the back rest, a supporting post depending from the seat member and which, when the body support is in use, approximates a vertical position, and said strap means being at least in part of resilient construction, so as to yield to enable said seat and back members to assume a different position when not in use and in which position said post will continue to extend downwardly well beneath the seat member.

2,099,346
FEED APPARATUS FOR PIPE COATING MACHINES AND THE LIKE
Albert G. Perkins, Warsaw, N. Y.
Application July 10, 1935, Serial No. 30,751
13 Claims. (Cl. 91—44)

1. In a machine for lining pipe walls having a carriage adapted to travel through the pipe,

means applied thereto for receiving a supply of coating material, and a revolving dispensing head communicating with said receiving means for projecting the material onto the pipe wall, and a feed device for delivering the material to the machine comprising a carriage adapted to travel

through the pipe in tandem relation to the machine, means for propelling said last-named carriage, and control means for said propelling means disposed in contacting relation with the machine-carriage for causing said last-named carriage to travel at the same speed as the machine-carriage.

2,099,347

RECOVERY OF CELLULOSE ESTERS FROM SCRAP

Marvin J. Reid, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

No Drawing. Application February 10, 1937, Serial No. 125,116

8 Claims. (Cl. 260—102)

1. A method for recovering photographic film having a base of a lower organic acid ester of cellulose which comprises washing the film scrap with warm water, then leaching it with a mixture of a lower aliphatic alcohol and acetone, in proportions which will swell the cellulose ester, at a temperature of 68°–110° F. under conditions whereby the scrap is not greatly softened and then washing the scrap to remove the leaching solution therefrom.

2,099,348

PROCESS FOR RECLAIMING FILM SCRAPS

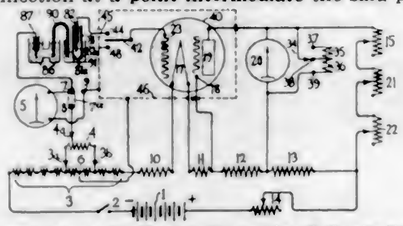
Marvin J. Reid, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

No Drawing. Application February 10, 1937, Serial No. 125,117

8 Claims. (Cl. 260—102)

1. A method of recovering an organic acid ester of cellulose from photographic film scrap containing it which comprises removing the gelatin emulsion therefrom, treating the scrap with a very dilute aqueous caustic solution at an elevated temperature, washing the caustic therefrom, drying, dissolving the material to form a thin solution in a solvent therefor and then clarifying the solution to remove the insoluble particles therefrom.

2,099,349



VACUUM TUBE POTENTIOMETER

Fred Rosebury, New York, N. Y., assignor to University Patents, Inc., New York, N. Y., a corporation of New York

Application October 3, 1934, Serial No. 746,678

7 Claims. (Cl. 175—183)

1. A vacuum tube potentiometer for measuring small voltages, comprising in combination an electron-discharge device having a filament, a control grid, and a plate electrode, a single battery for supplying a heating current to said filament, a plurality of resistances connected in series with said filament, connections from said resistances to the grid and plate for impressing respectively negative and positive voltages thereon with respect to the filament, a switch for impressing an unknown voltage on said control grid, an indicating instrument associated with the plate circuit of said electron-discharge device, a pair of resistances across which the indicating instrument is connected, there being a connection at a point intermediate the said pair

of resistances to the positive side of the battery, the said pair of resistances constituting two arms of a Wheatstone bridge of which another arm is constituted by the positive voltage-producing resistance and the filament and a final arm being constituted by the plate resistance of the electron-discharge device, together with an adjustable voltage divider, including resistances in series with the battery and the said plurality of resistances, the voltages set up thereby being adapted to be impressed upon the control grid.

2,099,350

PYROLYSIS OF HYDROCARBONS

Wesley C. Stoesser, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Michigan

No Drawing. Application May 17, 1935, Serial No. 22,105

5 Claims. (Cl. 260—170)

1. In a method of pyrolyzing hydrocarbons in apparatus constructed of iron or steel, the improvement which consists in preventing or reducing the formation of carbon by passing the hydrocarbon vapors at a pyrolyzing temperature through such apparatus of iron or carbon steel, the walls of which exposed to contact with the vapors have been previously subjected to the action of ammonia at a nitridizing temperature for a time sufficient to form a nitride coating thereon.

2,099,351

BITUMINOUS EMULSION

Preston R. Smith, Rahway, N. J., assignor, by mesne assignments, to The Barber Company, Inc., Philadelphia, Pa., a corporation of New Jersey

No Drawing. Application January 27, 1934, Serial No. 708,699

6 Claims. (Cl. 134—1)

1. A stable, aqueous clay emulsion of bitumen of the oil-in-water type including bitumen dispersed in water through the medium of clay, the clay being present in amount such that a dried, substantially hard film formed with the emulsion will readily re-emulsify in the presence of water, and a salt of a metal of the second series of the second periodic group dispersed in the water-continuous-phase of the emulsion, said salt being present in amount such that the tendency of a dried film formed with the emulsion to re-emulsify will be negatived and such that such film will be substantially resistant to water.

2,099,352

BITUMINOUS EMULSION

Preston R. Smith, Rahway, N. J., assignor, by mesne assignments, to The Barber Company, Inc., Philadelphia, Pa., a corporation of New Jersey

No Drawing. Application January 27, 1934, Serial No. 708,700

13 Claims. (Cl. 134—1)

1. An aqueous clay emulsion of bitumen of the oil-in-water type containing a copper salt of a monobasic acid in amount capable of rendering dry films formed from the emulsion substantially resistant to water.

2,099,353

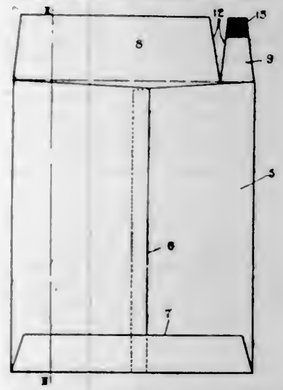
BITUMINOUS EMULSION

Preston R. Smith, Rahway, N. J., assignor, by mesne assignments, to The Barber Company, Inc., Philadelphia, Pa., a corporation of New Jersey

No Drawing. Application January 27, 1934, Serial No. 708,701

15 Claims. (Cl. 134—1)

1. An aqueous clay emulsion of bitumen of the oil-in-water type containing a lead salt in amount capable of rendering dry films formed from the emulsion substantially resistant to water.



2,099,354

ENVELOPE

Burt J. Steele, Columbus, Ohio

Application November 21, 1936, Serial No. 112,090

3 Claims. (Cl. 229—76)

1. An envelope for the mailing of matter subject to official inspection, said envelope having an opening throughout one of its edges, a relatively narrow flap connected with a wall of said envelope at one end of the said opening, said narrow flap having an adhesive thereon for securing it to the opposite wall of the envelope to restrain accidental escape of its contents, and a supplemental flap connected with a wall of the envelope at said opening, said supplemental flap being laterally disposed in respect to said narrow flap and in operative relation to the other end of said opening, said supplemental flap being freely adapted for insertion into and removal from said envelope, whereby mailable matter substantially filling said envelope is primarily and, before the adhesion of said narrow flap, easily and quickly insertible into said envelope without flexion and easily removable from said envelope by flexion for official inspection.

2,099,355

TOOL FOR CLEANING FURNACE-GRATES

Karl Herman Teorell, Stockholm, Sweden

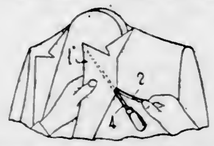
Application April 2, 1936, Serial No. 72,421

In Sweden October 24, 1935

2 Claims. (Cl. 294—14)

1. A tool for cleaning furnace grates, especially in magazine furnaces, consisting of a rod-like blade of segment shaped cross-section provided with straight, lengthwise extending edges, a pointed front end to facilitate the introduction of the tool and, at the back end, a straight pushing handle and a crank rocking handle for causing the tool to oscillate about the longitudinal axis of the pushing handle so that the said edges can be alternately raised and lowered when the tool has been pushed along the grate by the pushing handle.

2,099,356



REINFORCING INSERT FOR LAPELS ON COATS

Karl von Daeniken, Lucerne, Switzerland

Application April 13, 1936, Serial No. 74,179

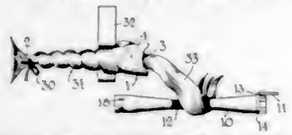
In Switzerland May 8, 1935

3 Claims. (Cl. 2—93)

1. A reinforcement insert for lapel-peaks of coats consisting of a body portion formed from relatively thin metal and having opposed flat surfaces and a rounded end portion, and a hook adjacent said round end portion offset from the planes of said flat surfaces and having the point directed toward the opposite end of said body portion.

2,099,357

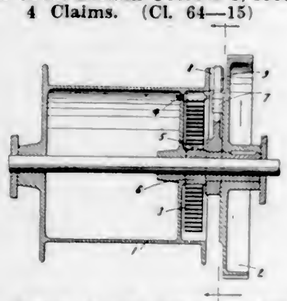
HALIDE ESTERS OF POLYUNSATURATED ALCOHOLS AND PROCESS OF PREPARING SAME



James H. Werntz, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application July 22, 1936, Serial No. 92,017

11 Claims. (Cl. 260—162)

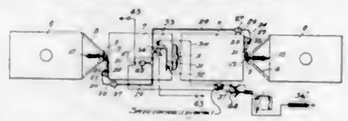


7. An octadecadienyl halide.

2,099,358
APPARATUS FOR WAVING HAIR
Frederick Witschi, Yonkers, N. Y.
Application April 14, 1933, Serial No. 666,188
11 Claims. (Cl. 132—33)

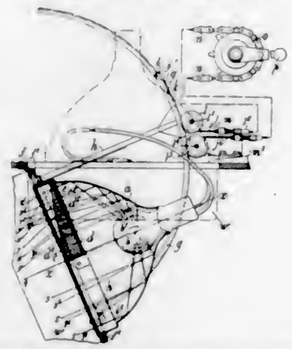
1. In hair-waving apparatus, a curler of tapering cross-section from end to end, the larger end of said curler being provided with a slot adapted to receive a strand coiled upon said curler and direct the same axially of said curler.

2,099,359
MEANS FOR DRIVING ROTARY MEMBERS
William Armstrong Woodeson and Walter Midgley, Gateshead-on-Tyne, England, assignors to William Armstrong Woodeson, Gateshead-on-Tyne, England
Application February 27, 1936, Serial No. 66,127
In Great Britain October 8, 1935
4 Claims. (Cl. 64—15)



1. In a device of the character described, a supporting shaft, a drum and a sleeve freely rotatable on said shaft independent of one another, a drive member for rotating said sleeve, a coiled spring concentrically disposed in respect to said shaft and said sleeve adjacent the drum, one end of said spring being connected to said drum and the other end to said sleeve to provide a resilient drive connection between the sleeve and the drum, laterally extending claws oppositely carried by said drum and said drive member and disposed to travel in paths clear of one another within a common plane, and a swing arm mounted to rotate freely on said sleeve within said plane in the path of travel of said claws and adapted to be engaged thereby so as to provide a positive drive connection therethrough between the drive member and the drum after the drive member has been rotated with respect to the drum a predetermined extent greater than one full revolution.

2,099,360
PROCESS OF PRODUCING PURE ALUMINA AND CRUDE POTASSIUM SULPHATE FROM ALUNITE
Sadao Yonemura, Koishikawa-ku, Tokyo, Tsuruji Okazawa, Shibuya-ku, Tokyo, and Kota Osada, Sakai, Edogawa-ku, Tokyo, Japan, assignors to Nihon Denki Kogyo Kabushiki Kaisha, Tokyo, Japan
No Drawing. Application May 24, 1935, Serial No. 23,334. In Japan March 6, 1934
3 Claims. (Cl. 23—141)

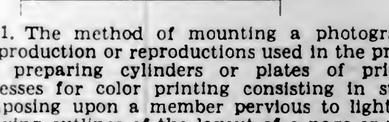


1. A process for producing substantially pure alumina and crude potassium sulphate from alunite which consists in pulverizing the alunite, adding thereto a 20% to 50% solution of caustic potash, the quantity of potash being sufficient to form potassium sulphate with the sulphur trioxide combined with the alumina in the alunite plus a quantity equal to 1 to 1.5 times the quantity of alumina, heating the solution to 100° C. to 180° C. while agitating same until the sulphur trioxide and alumina are converted respectively into potassium sulphate and potassium aluminate, cooling the solution to precipitate the potassium sulphate, filtering off the precipitated potassium sulphate together with the insoluble silicic acid and other insoluble residues, adding to the filtrate a quantity of water equal to the quantity of filtrate and in addition seed crystals of aluminum hydroxide, agitating the solution to precipitate aluminum hydroxide, filtering off the precipitate and finally calcining the aluminum hydroxide to produce alumina.

2,099,361
CENTERING DEVICE FOR SWIVEL TRUCKS
William S. H. Hamilton, Larchmont, and Frederic W. Butt, Woodside, Long Island, N. Y., assignors to The New York Central Railroad Company, a corporation of New York
Application May 14, 1936, Serial No. 79,796
24 Claims. (Cl. 105—175)

1. A locomotive having a swivel truck, a centering device controlling the swiveling movements of the truck with respect to the locomotive frame, and automatic means, governed by the speed of the locomotive, for regulating the resistance of the centering device to the swiveling movements of the truck to obtain relatively high and low resistances at locomotive speeds above and below a predetermined locomotive speed.

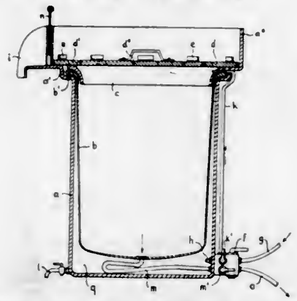
2,099,362
AIRCRAFT LAMP
Maldon Cavendish Harley, Cranford, England
Application December 12, 1934, Serial No. 757,226
In Great Britain December 14, 1933
1 Claim. (Cl. 240—7.7)



A retractable lamp mounting for use on airplanes with wings, comprising an annular flap hingedly mounted on the under side of the wing, a lamp secured to said flap, the front of the lamp being substantially flush with the plane of the annular flap, a quadrantal member extending rearwardly of the lamp and secured at one end to the flap at a point removed from said hinge mounting, operating means cooperating with said quadrantal member for pivotally and reciprocally retracting and lowering the flap, said wing being provided on its under side with an opening for receiving the lamp when in its retracted position, and said operating means comprise a flexible cable secured to the ends of the quadrantal member, a pair of pulley wheels secured to and within the wing, between which the cable passes substantially forming a loop, means associated with the loop for operating the cable whereby the quadrantal member and lamp may be reciprocally retracted and lowered.

2,099,363
TEXTILE
Winfield W. Heckert, Arden, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application August 3, 1936, Serial No. 94,116
12 Claims. (Cl. 91—70)

1. Process of finishing rayon which comprises impregnating rayon yarn with an emulsion of 10 parts of stearic anhydride in 90 parts of a 2% solution of deacetylated chitin in dilute aqueous acetic acid, drying, and heating for three minutes at 105° C.

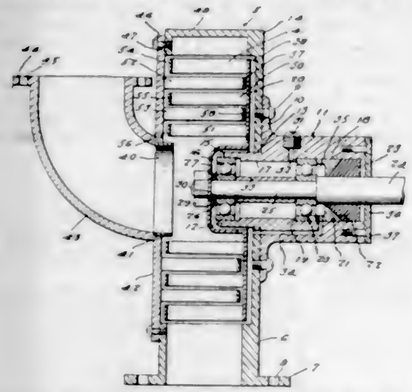


2,099,364
METHOD AND MEANS FOR REGISTERING PHOTOGRAPHIC REPRODUCTIONS USED IN PROCESS OF COLOR PRINTING
Edward Hunter, Springfield, Ohio
Application February 21, 1936, Serial No. 65,106
7 Claims. (Cl. 33—184.5)

1. The method of mounting a photographic reproduction or reproductions used in the process of preparing cylinders or plates of printing presses for color printing consisting in superimposing upon a member pervious to light and having outlines of the layout of a page or pages to be printed, a backing sheet of a character to expose the outlines of the layout member and temporarily maintaining the same in temporary fixed predetermined relation therewith, affixing to said backing a photographic reproduction or reproductions representing a given color in registry with the outlines of the layout member, and then superimposing on said backing another backing in the same temporary predetermined fixed relation with said layout member as said first backing and of a character to expose the reproduction or reproductions on said first backing, and then affixing to said second backing a photographic reproduction or reproductions representing another color in exact registry with the reproduction or reproductions on said first backing.

6. Means of mounting photographic films or plates used in the process of preparing cylinders or plates of printing presses for color printing consisting of a layout plate pervious to light and having layout outlines thereon, properly positioned pins on said layout plate, a backing sheet for photographic reproduction or reproductions apertured to receive said pins and hold said backing in temporary fixed relation with said layout plate whereby photographic reproduction or reproductions may be secured to said backing sheet in registry with the layout outlines, and another backing sheet apertured to receive said pins adapted to be placed upon said first backing sheet in temporary fixed relation therewith whereby a photographic reproduction or reproductions may be secured upon said second backing sheet in registry with the photographic reproduction or reproductions on said first backing sheet.

2,099,365
LINEN WRINGING MACHINE
Käthe Kemper, Halver, Germany, assignor to Friedrich Emil Krauss, Schwarzenberg, Saxony, Germany
Application August 20, 1930, Serial No. 476,649
In Germany October 11, 1929
8 Claims. (Cl. 68—37)



1. A linen wringing machine comprising in combination a deep independent portable casing open at its upper end, a perforated substantially flat cover for the upper end of said casing, securing means on the casing adapted to engage the cover for releasably securing the cover to the casing, a bag for receiving the linen pieces to be wrung and suspended inside the casing with its margin adjacent the upper end of the casing and contacting the wall thereof, said casing having an inlet adapted to be connected to a pressure water supply conduit for admitting water under pressure to the interior of the casing between the bag and the casing for squeezing the bag to express fluid therefrom, said casing having an outlet through the upper part of its wall leading from the interior of the casing above the perforated cover to discharge the expressed fluid and a draining outlet for enabling water admitted to the interior of the casing between the casing and the bag to be removed from the casing.

2,099,366
SUPERCHARGER
Charles A. Kutcher, Sheridan, Wyo.
Application February 12, 1937, Serial No. 125,513
2 Claims. (Cl. 230—131)

1. In a supercharger of the character described, a casing having a substantially tangential discharge, a tubular bearing support mounted eccentrically on one side of the casing and having a portion extending into the casing, a shaft having an end located in the support, the said shaft terminating slightly beyond the inner end of the support, bearings in the support and engaging parts of said end of the shaft, an inlet member connected with the other side of the casing and having its discharge end or mouth in axial alignment with the inner end of the support, stationary

circular series of blades on the last-mentioned side of the casing, a rotor having an inwardly extending hub fitting over the inner end of the

support and connected with the terminal of the shaft, movable circular series of blades carried by the rotor and in effective relation to said stationary series of blades.

2,099,367

METHOD OF COMPOUNDING CERAMIC PRODUCTS

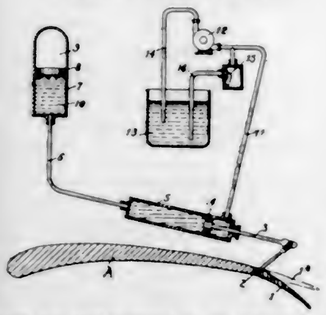
Jacques Gustave Adolphe Lefranc, Paris, France

No Drawing. Application February 4, 1935, Serial No. 4,992. In France February 6, 1934

6 Claims. (Cl. 106—9)

1. A method for the manufacture of ceramic materials which consists in preparing a binder by treating a calcic phosphate containing several calcic molecules by an acid, so as to bring back said phosphate to the state of an inferior calcic phosphate, the quantity of acid being such that there will be no excess of free acid and mixing said binder with a nonplastic material.

2,099,368



DEVICE FOR THE AUTOMATIC CONTROL OF CAMBER FLAPS AND THE LIKE FOR AIRPLANES

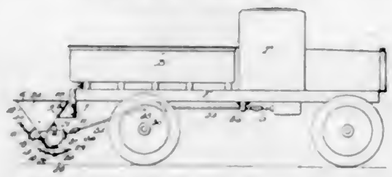
René Lucien Levy, Montrouge, France, assignor to Société d'Inventions Aeronautiques et Mecaniques S. I. A. M., Fribourg, (Suisse)

Application February 13, 1936, Serial No. 63,805

In France April 5, 1935

1 Claim. (Cl. 244—42)

A device for the control of an airplane camber flap, or the like, comprising: a hydraulic cylinder, a piston movable in said cylinder, a hydro-pneumatic accumulator, a pipe line connecting this cylinder with said tank on one side of said piston, a liquid tank connected to said cylinder on the other side of the piston, a valve interposed in the pipe line connecting the cylinder to the tank, a source of hydraulic pressure allowing to move said piston in the direction corresponding to the increase of the pressure in said accumulator, and means for connecting said piston to the camber flap for actuating the latter in one direction and in the other.



2,099,369

LIME SPREADER

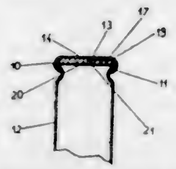
Wilmer A. Lutz, Bucyrus, Ohio

Application June 26, 1936, Serial No. 87,563

3 Claims. (Cl. 275—8)

1. In combination with a motor truck having a chassis frame and a dump body over said frame; a horizontally elongated hopper disposed transversely behind said frame in position to receive material discharged from said dump body, angle bars secured to the rear end of said frame and having rearwardly projecting flanges disposed in parallel vertical planes, forwardly projecting angle plates secured to the front side of said hopper in parallel vertical planes and overlapping said flanges, bolts securing said angle plates to said flanges, means for spreading the material discharged from said hopper, and driving means operatively connecting said spreading means with a driven part of the truck.

2,099,370



PHIAL

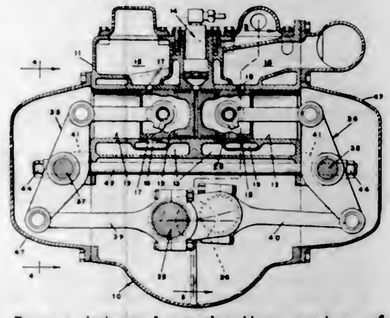
Vital Monnier, Lausanne, Switzerland

Application August 26, 1936, Serial No. 98,100

In Switzerland September 7, 1935

2 Claims. (Cl. 215—37)

1. Phial for containing medicinal preparations comprising a metallic non-perforated capsule, said capsule comprising at least one thin part intended to be pierced by the point of the needle of a syringe without damaging the needle, the said capsule covering a member of elastic material provided with at least two orifices, one of which is located opposite the thin part of the capsule and permits the penetration of the nozzle of a hypodermic syringe for aspirating the contents of the phial, the other orifice preventing the formation of a vacuum in the phial and being provided with a sterilized filter, the said member of elastic material being placed on at least one metallic sheet closing the opening of the phial.



2,099,371

DIESEL ENGINE

Ransom E. Olds, Lansing, Mich., assignor to Hill-Diesel Engine Company, Lansing, Mich., a corporation of Michigan

Application August 27, 1934, Serial No. 741,701

2 Claims. (Cl. 123—51)

1. In an internal combustion engine of the Diesel type, a block having a pair of parallel cylinders extending therethrough and open at their opposite ends, each of said cylinders having a central fuel injection port and air intake and exhaust ports symmetrically arranged on opposite sides thereof, a crank shaft having its axis extending transverse to the axes of the cylinders at one side and centrally thereof, said crank shaft having oppositely arranged throws slightly displaced from an angle of 180°, opposed pistons in said cylinders cooperating with each other in the inmost position thereof to form a combustion chamber, walking beams arranged at opposite ends of the block, one end of each being connected with a piston, rods connecting the opposite ends of said walking beams with said crank throws, shafts on which said walking beams are fulcrumed and tie rods connecting said shafts and extending therethrough, said tie rods being arranged on opposite sides of said walking beams.

2,099,372

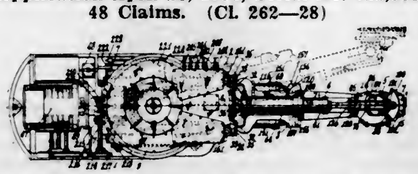
MEANS AND METHOD OF DETERMINING THE INCLINATION OF WELL HOLES

Carl A. Reinhard, Los Angeles, Calif.

Application August 28, 1929, Serial No. 388,944

20 Claims. (Cl. 33—205.6)

1. A device of the class described comprising an elongated body adapted to be dropped or lowered into a well, said body having rigid ends, means forming a flexible connection between the ends enabling one end to move laterally with respect to the other, and means associated with the body for indicating its inclination when the body comes to rest near the bottom of the well, said flexible connection also providing a resilient cushion between the ends of the body.



2,099,373

MINING APPARATUS

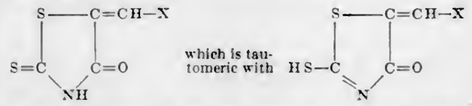
Dwight R. Richards, Claremont, N. H., assignor to Sullivan Machinery Company, a corporation of Massachusetts

Application April 26, 1934, Serial No. 722,568

48 Claims. (Cl. 262—28)

1. In a mining apparatus, a portable base, an arm structure pivotally mounted on said base to swing in a vertical direction relative thereto, a cutter support swingably mounted on the outer extremity of said arm structure, a kerf cutter pivotally mounted on said cutter support to swing relative thereto, a motor on said base relative to which said arm structure is swingable, devices driven by said motor for actuating said kerf cutter including a transmission shaft extending longitudinally of said arm structure, and devices driven by said shaft for swinging said cutter support relative to said arm structure including a screw and nut mechanism parallel with said shaft.

2,099,374



PHOTOGRAPHIC DEVELOPER AND A PROCESS OF PHOTOGRAPHIC DEVELOPING

Georg Schwarz, Anvers, Belgium, assignor to Gevaert Photo-Production N. V., Oude God, near Anvers, Belgium

No Drawing. Application April 5, 1935, Serial No. 14,920. In Austria April 7, 1934

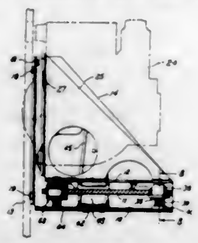
6 Claims. (Cl. 95—88)

1. The mixture of a photographic silver halide developer with a compound corresponding to the formula

wherein =CH—X is the residue of a non-basic cyclic aldehyde, resulting from the condensation of such aldehyde with 2-thio-4-keto-thiazolidine.

2,099,375

ANTIVIBRATION SUPPORT FOR INSTRUMENTS



Clarence Lee Seward, Jr., Washington, D. C., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware

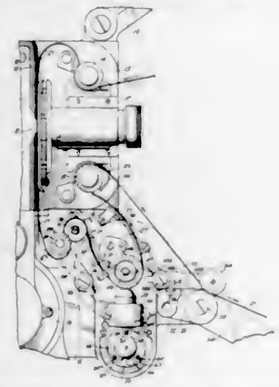
Application May 7, 1935, Serial No. 20,237

6 Claims. (Cl. 248—358)

4. An anti-vibration support comprising three substantially horizontal supporting members disposed one above the other in parallel planes, one of said members being provided with means for securing thereto a device which is to be prevented

from vibrating and another one of said members being provided with means for securing it to a fixed support susceptible to vibration, the third member being interposed between said first two members, vertically yielding means between one of said first two members and the third member

for absorbing vibrations in a vertical direction, and horizontally yielding means between the other of said first two members and the third member for absorbing vibrations in a horizontal direction and slidable means cooperating with said horizontally yielding means for facilitating relative horizontal movement.



2,099,376

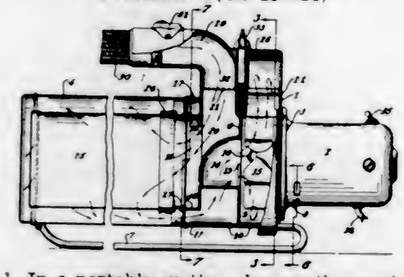
MOTION PICTURE AND SOUND REPRODUCING MACHINE

Abraham Shapiro, Chicago, Ill., assignor to Universal Stamping & Mfg. Co., Chicago, Ill., a corporation of Illinois

Application June 26, 1936, Serial No. 87,438

6 Claims. (Cl. 179—100.3)

1. In a sound mechanism for use with moving picture films having a sound track, the combination of a mounting plate formed with a transverse opening, an insulating sleeve mounted in said opening, a tube mounted in said sleeve having a portion thereof projecting beyond one end of said sleeve and formed with a narrow slot, a photoelectric cell housed in and supported by said tube, a portion of said cell lying opposite said slot, a hollow rotatable drum formed with an open end encircling with slight clearance only the projecting portion of said tube beyond said slot, said film passing over and driving said drum, and an exciter lamp and lens mounted on said mounting plate laterally opposite said tube in a position to project a straight light beam directly across the sound track on the film through said slot and onto said cell.



2,099,377

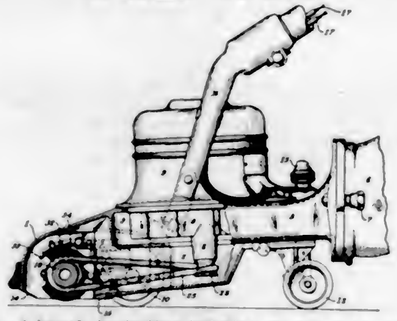
SUCTION CLEANER

Donald G. Smellie, Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio

Application May 24, 1934, Serial No. 727,211

8 Claims. (Cl. 15—14)

1. In a portable suction cleaner, the combination of a fan chamber having an inlet and an outlet, a fan in said fan chamber, a motor for driving said fan, a dust bag, a sealed container enclosing said dust bag and having an intake passageway connected with the interior of said bag and an opening directly to the inlet to said fan chamber, a sound-deadening air passageway open at one end to the atmosphere and adapted to have its opposite end connected to said intake to or said outlet from said fan chamber, and valve means having a dusting tool connection and adapted to be positioned to connect said hose connection with said outlet or said inlet.



2,099,378

SUCTION CLEANER

Donald G. Smellie, Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio

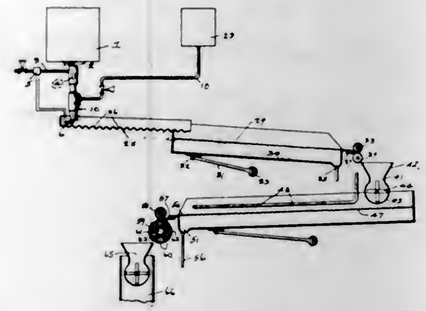
Application November 28, 1934, Serial No. 755,095

28 Claims. (Cl. 15—8)

1. A brush including bristles, means supporting said brush for movement toward and from a surface, means to move said brush toward said surface, and means responsive to the change in length of said bristles to operate said last mentioned means.

2,099,379

METHOD OF MANUFACTURING CASEIN



John Robert Spellacy, Millbrae, Calif., assignor, by mesne assignments, to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

Application September 19, 1934, Serial No. 744,680

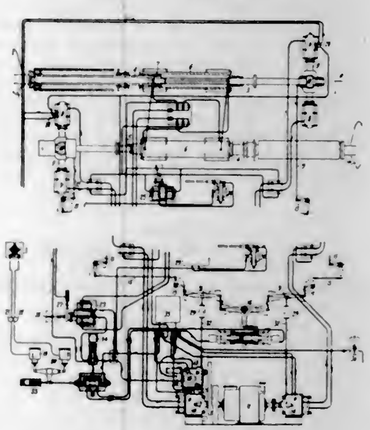
13 Claims. (Cl. 134—12)

1. A continuous process of manufacturing casein comprising; precipitating curd from milk by

adding to the latter a dilute acid; firming the precipitated curd into non-granular natural pieces in the resultant liquids; separating the firmed curd from said liquids; immediately thereafter squeezing the firmed curd in a con-

tinuously moving stream; milling the curd into small pieces; and washing and drying the curd; the squeezing step acting to prevent the disintegration of the curd into fine particles by the subsequent milling and washing steps.

2,099,380



ANTIROLLING APPARATUS FOR SHIPS

William Wallace, Edinburgh, Scotland, assignor of one-half to Brown Brothers & Company Limited, Edinburgh, Scotland, a corporation of Great Britain, and one-half to William Denny & Brothers Limited, Dumbarton, Scotland, a corporation of Great Britain

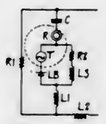
Application December 22, 1936, Serial No. 117,205

In Great Britain May 21, 1936

12 Claims. (Cl. 114—122)

1. Anti-rolling apparatus for ships comprising at least two fins on opposite sides of the ship, an axially movable shaft carrying each fin, an oscillatory shaft in splined relation with each axially movable shaft, at least one hydraulic motor for effecting oscillatory movements of said oscillatory shafts, means for effecting endwise movements of said axially movable shafts, and control gear ensuring synchronization of said oscillatory movements.

2,099,381



TELEPHONE INSTRUMENT CIRCUIT

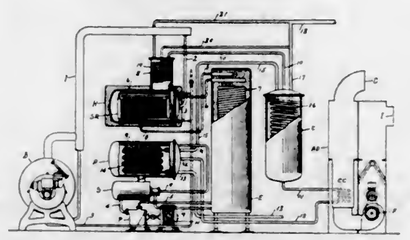
Edmund Ramsay Wigan, London, England, assignor to Siemens Brothers & Company Limited, London, England

Application January 11, 1935, Serial No. 1,318

In Great Britain January 31, 1934

1 Claim. (Cl. 179—81)

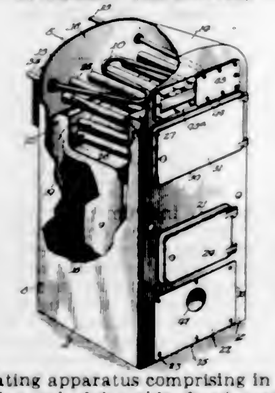
In a telephone instrument, a transmitter, a receiver, two impedances, an induction coil having three windings, a local battery and a line, a closed local circuit including one winding of said induction coil, one impedance, a transmitter and said battery, another winding of said induction coil connected in series with said line so that all line current passes therethrough, a bridge across said line including said receiver connected in series with said closed circuit, another bridge across said line in parallel with said first bridge including said other impedance, said third winding connected in series with one of said parallel bridges and a condenser connected in series with and included in said first bridge.



2,099,382

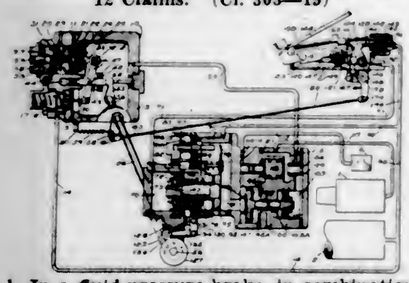
REFRIGERATING APPARATUS

Glenn F. Zellhoefer, Bloomington, Ill.



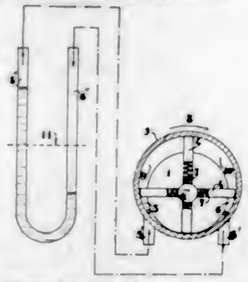
Application August 22, 1935, Serial No. 37,307

1 Claim. (Cl. 62—119)



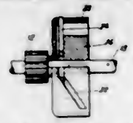
In a two fluid absorption refrigerating apparatus including a still, an absorber, a heat exchanger interposed between the still and absorber, a rectifier in direct communication with the still, a cooling coil, and a condenser interposed between the rectifier and said coil, wherein the solvent is circulated from the still through the heat exchanger into the absorber where it picks up the refrigerant, carries it in solution through the heat exchanger into the still where the refrigerant is boiled off, and passes through the rectifier into the condenser and then into the cooling coil and back to the absorber, a system for circulating cooling water from a common source through coils in the absorber, condenser and rectifier, wherein the flow is controlled to successively raise the temperature of the water at each step to condense the refrigerant in the condenser at the proper pressure and to condense such of the solvent vapors as may pass over from the still into the rectifier without condensing the refrigerant passing therethrough.

2,099,383
HEATING APPARATUS
William Anderson, Williamsport, Pa., assignor to Lycoming Manufacturing Company, Williamsport, Pa., a corporation of Pennsylvania
Application May 1, 1937, Serial No. 140,141
10 Claims. (Cl. 122—32)



1. A heating apparatus comprising in combination a boiler embodying side, front, rear and top walls and having a combustion chamber in the bottom thereof and a combined water and steam chamber in its upper portion and also having an opening in the upper part of the front wall communicating with the last mentioned chamber and a removable plate for closing said opening, a domestic hot water coil in the combined water and steam chamber insertable into place through said opening and having the ends thereof leading through a boiler wall other than the front wall and connected to such wall by detachable connections so that upon detachment thereof the coil may be removed through said opening for cleaning or replacement purposes, a burner in front of the boiler for firing the latter, and a jacket surrounding the boiler and burner and having door means at its front adapted upon opening thereof to expose the plate.

2,099,384
FLUID PRESSURE BRAKE
Rankin J. Bush, Jeannette, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application May 29, 1935, Serial No. 24,037
12 Claims. (Cl. 303—19)



1. In a fluid pressure brake, in combination, a brake valve device operable to supply fluid under pressure to a brake cylinder to effect an application of the brakes, manually operated means for operating said brake valve device, fluid pressure responsive means for supplying fluid under pressure to the brake cylinder, and means subject to and operated by the fluid under pressure supplied to the brake cylinder by the brake valve device on a partial application of the brakes for cutting off the communication through which the last named means supplies fluid to the brake cylinder.

2,099,385
PNEUMATIC TACHOMETER WORKING INDEPENDENTLY OF THE EXTERNAL PRESSURE
Ugo Ciamberlini, Rome, Italy
Application June 17, 1936, Serial No. 85,810
In Italy October 5, 1935
2 Claims. (Cl. 264—14)

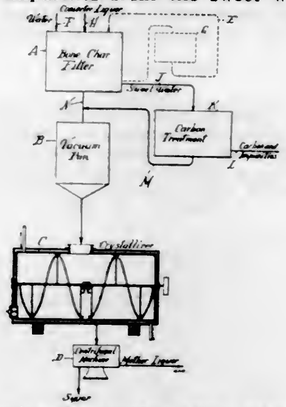
1. In a tachometer of the pressure difference type, comprising a pump adapted to be driven by the shaft whereof the number of revolutions is to be ascertained, and a casing interiorly provided with two spaced partitions dividing the casing into three chambers and said pump being completely isolated from effects of the outside atmosphere by means of an elastic tight coupling in one chamber provided with an oblique transmission rod, the combination, with ends of two shafts for said coupling, of connecting means connecting the ends of said oblique transmission rod to the ends of said two shafts including two discs fixed upon said ends of the shafts, a spherical articulated bearing means providing for oscillation of said oblique rod mounted adjacent to the one interior partition of said one chamber, and means providing an air tight closure about said oblique rod and the spherical articulated bearing means including a boss upon said rod and a conical rubber hood having the smaller end clamped against said boss and the larger end secured to said one interior partition.

2,099,386
MOTOR STARTING DEVICE
Pierre Cibié, Paris, France
Application June 12, 1935, Serial No. 26,196
In France June 19, 1934
1 Claim. (Cl. 74—9)

A motor starting device which comprises: a shaft driven by the starting engine, a plate integral with said shaft, a driving pinion loosely mounted upon said shaft and integral with a second plate, a spring rod fixed at one end to the plate of the shaft of the starting engine and an inclined surface having a straight portion and an inclined portion provided in said second plate integral with the driving pinion and in which the opposite end of the spring rod slides.

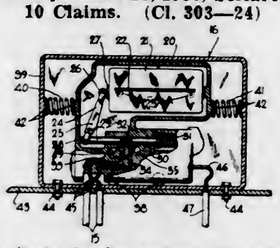
2,099,387
COMBINED CENTER-BAR BUCKLE AND BELT-CONNECTER
Samuel H. Cohn and Samuel Levin, New York, N. Y.
Application November 28, 1936, Serial No. 113,104
4 Claims. (Cl. 24—171)

1. A center-bar belt buckle embodying a frame including front and rear frame bars and having at one side of the center bar means to provide a buckling engagement with the forward end of a belt and mechanism at the rear side of said center bar for connecting the rear end of the belt to the buckle and comprising a pair of substantially parallel cinch-bar members composed of round wire mounted in said frame between the center-bar and the rear frame bar, said cinch-bars having opposite end portions supported in said frame and depressed bar portions arranged to cooperate with said rear frame bar to provide for a threading, looping and bending of the belt around and over the said cinch bars to produce a cinching action.



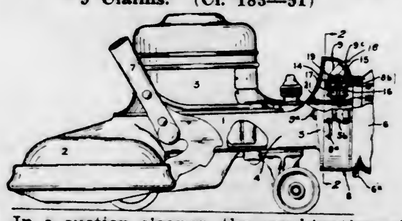
2,099,388
BIMETALLIC CORROSIVE-FLUID-CONTACT TUBE
Donald K. Crampton, Marion, Conn., assignor to Chase Brass & Copper Co., Incorporated, Waterbury, Conn., a corporation of Connecticut
Application December 28, 1936, Serial No. 117,861
13 Claims. (Cl. 138—64)

1. A bimetallic galvanic-attack-resistant wrought-metal tube having an inner seamless tube-layer composed mainly of wrought-copper and an outer seamless tube-layer also composed mainly of wrought-copper but of different analysis and in intimate thermal contact with the adjacent tube-layer, and at least of the two said tube-layers containing in addition to its dominant copper-content an alloying metal providing distinctively different corrosion-resistant properties as compared to the corrosion-resistant properties of the other of said tube-layers.



2,099,389
METHOD OF REFINING SUGAR LIQUORS
Charles Ebert, Leonia, N. J., and William B. Newkirk, Western Springs, Ill., assignors to International Patents Development Company, Wilmington, Del., a corporation of Delaware
Application April 11, 1935, Serial No. 15,800
4 Claims. (Cl. 127—55)

3. In the process of making dextrose from starch converted dextrose solutions in which the converted liquor before crystallization is passed through a bone char filter, water circulated at intervals through the filter, and the sweet water mixed with dextrose solution to be crystallized and thus returned to the process for recovery of its sugar content in the crystallizing operation: the improvement which consists in subjecting the sweet water to treatment with 0.2% to 0.5% of virgin activated carbon, or to proportionately larger quantities of partially spent carbon, at a temperature of approximately 160° F. for approximately thirty minutes, removing the carbon and adsorbed impurities from the sweet water and



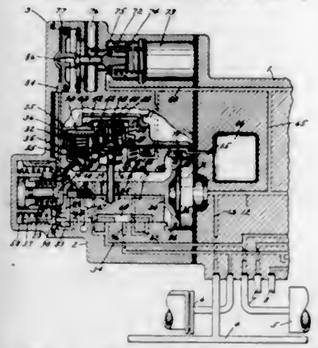
then returning the purified sweet water to the process.

2,099,390
SHOCKPROOF RETARDATION CONTROLLER
Ellery R. Fitch, Irwin, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application September 18, 1936, Serial No. 101,465
10 Claims. (Cl. 303—24)

1. In a train brake system, in combination, means for applying the brakes on the train, means operated according to the rate of retardation of the train for controlling the degree of application of the brakes, and means for mounting said last means on the train and being so constructed and arranged as to protect said last means from shocks produced in the train.

2,099,391
SUCTION CLEANER
Dale C. Gerber, North Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio
Application October 18, 1935, Serial No. 45,531
9 Claims. (Cl. 183—51)

1. In a suction cleaner, the combination of a suction producing unit having an outlet connection including a ring divided longitudinally



to provide a rearwardly opening chamber and an exhaust passage, an air pressure indicator mounted in said chamber and a dust receptacle attached to said ring and communicating with said chamber.

2,099,392

FLUID PRESSURE BRAKE

John N. Good, Wilmerding, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application August 27, 1936, Serial No. 98,135
17 Claims. (Cl. 303—42)

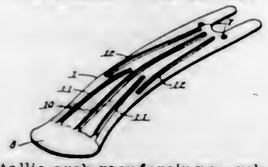
1. In a fluid pressure brake, in combination, a brake pipe, an emergency valve device comprising a piston subject to the opposing pressures of said brake pipe and a chamber normally charged with fluid under pressure, valve means operative by said piston upon a reduction in brake pipe pressure at an emergency rate to effect an emergency application of the brakes, a valve separate from said piston and normally establishing a communication from said chamber to said brake pipe through which the pressure of fluid in said chamber is adapted to reduce with that in said brake pipe upon a reduction in brake pipe pressure at a service rate, and means operative by the movement of said valve means to effect an application of the brakes to operate said valve to close said communication.

2,099,393

MECHANISM FOR LAYING SHOE SOLE CHANNELS

Hiram Gordon, Columbus, Ohio, assignor to The Walker T. Dickerson Company, Columbus, Ohio, a corporation of Ohio

Application November 8, 1934, Serial No. 752,086
2 Claims. (Cl. 12—33)



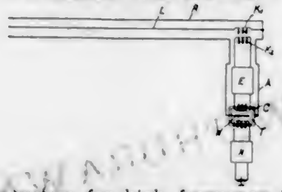
1. As a new article of manufacture, a press pad for laying shoe channels comprising a flexible elastic body formed to closely engage the lower surfaces of a shoe outsole during a channel pressing operation, one end of said pad being provided with spaced cushions of increased cross sectional area to engage with the shank regions of shoe outsoles, and holding clamps carried by said pad for engagement with the upper extension edges of a shoe outsole.

2,099,394

SHANK STIFFENER

Hiram Gordon, Columbus, Ohio, assignor to The Walker T. Dickerson Company, Columbus, Ohio, a corporation of Ohio

Application October 10, 1936, Serial No. 105,065
2 Claims. (Cl. 36—76)



1. A metallic arch reenforcing member for shoes comprising a sheet metal stamping formed to constitute a longitudinally arched metallic body extending from the heel to the metatarsal areas of a shoe, the heel end of said member being substantially flat and apertured and the forward metatarsal portion of said member terminating in a flattened and transversely enlarged extension, said member between the heel and metatarsal ends thereof being provided with a single centrally disposed longitudinally extending reenforcing rib and at each side of said rib with a pair of shorter diagonally extending reenforcing ribs having overlapping ends.

2,099,395

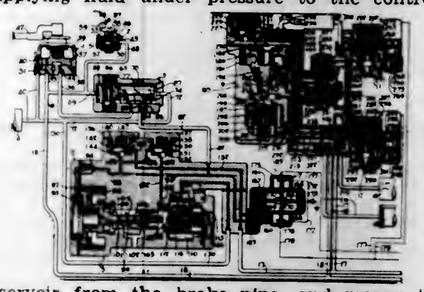
SYSTEM FOR HIGH FREQUENCY TRANSMISSIONS

Walter Max Hahnemann, Berlin-Marienfelde, and Felix Gerth, Berlin-Tempelhof, Germany, assignors to C. Lorenz Aktiengesellschaft, Berlin-Tempelhof, Germany, a company

Application July 27, 1935, Serial No. 33,468
In Germany August 8, 1934
3 Claims. (Cl. 178—44)

1. In a system for high frequency transmission, a cable containing concentric conductors, a high frequency device connected to said cable, a screen for said high frequency device, said screen being connected to the outer of said concentric conductors, a low frequency equipment, a transformer connecting said equipment to the said high frequency device and screening means fitted to said transformer and completing the screening of the said high frequency device.

2,099,396



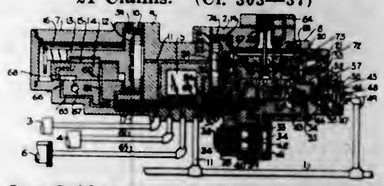
FLUID PRESSURE BRAKE

Ellis E. Hewitt, Edgewood, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application August 24, 1935, Serial No. 37,700
17 Claims. (Cl. 303—15)

1. In a fluid pressure braking system, in combination, a brake cylinder, a supply reservoir, a control reservoir, a brake pipe, a relay valve device operated by an increase in fluid pressure for supplying fluid under pressure from the supply reservoir to the brake cylinder, means for supplying fluid under pressure from the control

reservoir to the relay valve device, means for supplying fluid under pressure to the control



reservoir from the brake pipe, and means to control the rate of flow of fluid from the brake pipe to the control reservoir.

2,099,397

FLUID PRESSURE BRAKE

Ellis E. Hewitt, Edgewood, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application March 5, 1936, Serial No. 67,261
21 Claims. (Cl. 303—37)

1. In a fluid pressure brake equipment, in combination, a brake pipe, a brake controlling valve device operated upon an emergency reduction in brake pipe pressure to effect an emergency application of the brakes, valve means operative by fluid under pressure supplied by said brake controlling valve device in effecting an emergency application of the brakes to establish a communication through which fluid under pressure is locally vented from the brake pipe, and means constantly subject to brake pipe pressure responsive to a reduction in brake pipe pressure of sufficient magnitude to insure a full emergency application of the brakes for effecting the operation of said valve means to close said communication.

2,099,398

FASTENING DEVICE

Peter A. Jensen, Wall Lake, Iowa

Application February 18, 1937, Serial No. 126,371
1 Claim. (Cl. 24—73)

A fastening device comprising an open frame of elongated rectangular configuration in plan provided with a cross bar extending between the longer sides of said frame, a tongue-pin pivotally secured to said bar for swinging movements upon one of the end portions of said frame, a hook member formed rigidly integral with said bar and extending from the latter beyond the other end of said frame and spaced from said last mentioned end for receiving a strap therebetween, and a closure tang secured to said bar provided with a resilient portion having an end normally abutting the end of said hook for closing the mouth of the latter.

2,099,399

METHOD OF MANUFACTURING PAPER PULP

Edwin P. Jones, Garden City, N. Y., assignor to Champagne Paper Corporation, New York, N. Y., a corporation of New York

No Drawing. Application October 16, 1936, Serial No. 105,915
1 Claim. (Cl. 92—16)

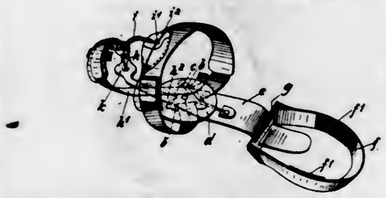
That improved method of producing bleached pulp from linen rags, which consists in subjecting the rags to a cooking operation in a digester with a solution of water of approximately 2½ to 4 times the dry weight of the rags, 1% to 4% sulphur, 4% to 10% calcium oxide, and 12% to 20% sodium carbonate, the quantities of the chemicals employed being based on the dry weight of the rags; washing the cooked rags to remove excess shive and water soluble impurities and then bleaching.

2,099,400

PREPARATION OF PAPER PULP

Edwin P. Jones, Garden City, N. Y., assignor to Champagne Paper Corporation, New York, N. Y., a corporation of New York

No Drawing. Application October 19, 1936, Serial No. 106,369
2 Claims. (Cl. 92—16)



1. That improved method of producing bleached pulp from flax or hemp tow, which consists in subjecting the tow to a cooking operation in a digester with a solution of water of approximately 2½ to 4 times the dry weight of the fiber, and 14% to 20% sodium hydroxide and 1% to 4% sulphur, the quantities of the chemicals employed in the solution being based on the dry weight of tow; then washing the cooked fiber to remove shive fiber and water soluble impurities, and bleaching the fiber.

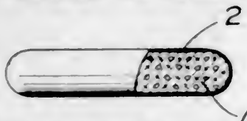
2,099,401

ORTHOPEDIC CORRECTING APPLIANCE

Martin Jungmann, Vienna, Austria

Application June 19, 1935, Serial No. 27,280
In Austria June 27, 1934
5 Claims. (Cl. 128—80)

1. An orthopedic appliance for correcting deformations of the foot, comprising in combination an adjustable tensional binder strap adapted to encircle the foot in the region of the metatarsal bones and to cross-tie the transverse arch of the foot, a longitudinal tension strap adapted to lie against the sole of the foot and attached at one end thereof to the said binder strap and adapted to be fastened at its other end to the heel of the foot for the purpose of cross-tying the longitudinal arch of the foot, an adjustable noose adapted to be looped around the big toe of the said foot



and fastened near both its ends to the said binder strap next the point of attachment of the longitudinal tension strap to the binder strap, means for determining the position of another point of the said noose relatively to the binder strap, so as to be held remote from this strap and for causing a tension created in the noose to exert a downwardly directed torsional pull upon the said toe.

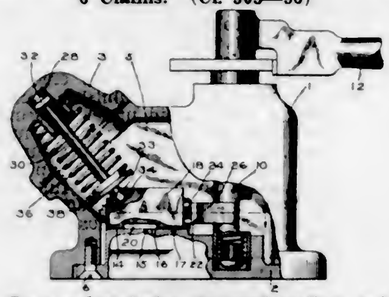
2,099,402
PILL OR TABLET
Joseph Walter Keller, Merion, Pa., assignor to Pratt Food Company, Philadelphia, Pa., a corporation of Pennsylvania
Application January 17, 1934, Serial No. 706,991
1 Claim. (Cl. 167—82)

A pill containing a drug having a coating which is insoluble in the acid tract and soluble in the alkaline tract, and having another coating which is exterior to the first, the second coating carrying another drug, this coating being soluble in the acid tract but the second drug being effective only in the alkaline tract, whereby a time interval between the action of two simultaneously administered drugs in the alkaline tract is obtained.

2,099,403
SPLIT ACTION TABLET
Joseph Walter Keller, Merion, Pa., assignor to Pratt Food Company, Philadelphia, Pa., a corporation of Pennsylvania
Application November 24, 1934, Serial No. 754,625
1 Claim. (Cl. 167—82)

A surface finished split action medicinal tablet for treatment of an alkaline tract, said tablet being devoid of protective coats and consisting of a core and an enveloping crust in intimate contact with each other, said crust and core containing different medicaments, the medicament of said crust being inactive in the acid and neutral digestive tracts but active in the following alkaline tract, said core including an added binder whereby the core opposes greater resistance to physical disintegration in the acid and neutral digestive tracts than the crust and passage of the core material to the alkaline tract is thereby delayed.

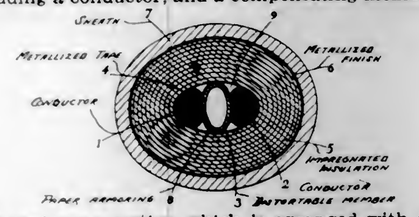
2,099,404
LIGHT SENSITIVE COLLOID LAYERS AND TANNED PICTURES THEREFROM
Gustav Kögel, Baden-Baden, and Rudolf Zahn, Wiesbaden, Germany, assignors to Kalle & Co. Aktiengesellschaft, Wiesbaden-Biebrich, Germany
No Drawing. Application January 10, 1935, Serial No. 1,238. In Germany January 19, 1934
8 Claims. (Cl. 95—6)



1. Process for the production of tanned pictures which comprises exposing a light-sensitive layer comprising a colloidal substance capable of being tanned and an aromatic light-sensitive compound of the group consisting of nitro compounds of the benzene and naphthalene series, the light-decomposition products of which are capable of tanning the colloid under a pattern and then dissolving the colloid not tanned by the action of light.

2,099,405
RESILIENT LIGHT SOCKET AND BRACKET EXTENSION
Jesse D. Langdon, Los Angeles, Calif., assignor of two-thirds to George J. Kilgen and Edward W. Todd, both of Los Angeles, Calif.
Application February 15, 1937, Serial No. 125,728
5 Claims. (Cl. 173—358)

2. The combination of an electric light socket formed of a unitary piece of rubber-like material to receive the shank of an electric light globe and having an integral inwardly extending boss resilient enough to support and maintain contact between circuit completing connections disposed within said socket, and elements combined with said socket to hold the shank of said globe and said circuit completing connections in assembled relationship within said socket.

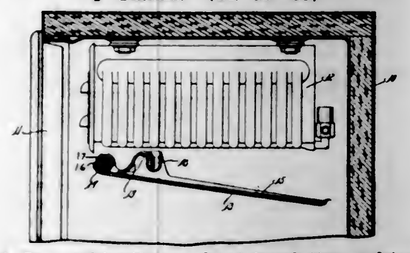


2,099,406
VALVE LOADER
Ewing K. Lynn, East McKeesport, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application September 16, 1936, Serial No. 101,011
6 Claims. (Cl. 303—56)

1. In a valve device, in combination, a body having a seat thereon having ports therein, a slide valve movable upon said seat to control communication through said ports, a cam associated with said slide valve for moving it in one direction on said seat, and a spring associated with said slide valve for yieldingly pressing said slide valve against said seat and for also pressing said slide valve against said cam.

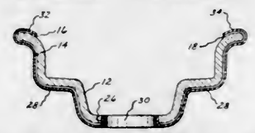
2,099,407
ELECTRIC CABLE
Raymond Charles Mildner, London, England, assignor to International Standard Electric Corporation, New York, N. Y.
Application August 13, 1935, Serial No. 35,923
In Great Britain February 1, 1935
11 Claims. (Cl. 173—266)

1. An electric cable comprising a core of oval cross-section, impregnated insulating material surrounding said core, and a metal sheath surrounding said insulating material, said core including a conductor, and a compensating member



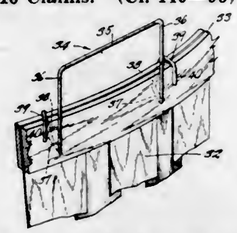
of oval cross section which is arranged with its major axis at right angles to the major axis of the oval core.

2,099,408
PROTECTING DEVICE
Richard A. Packert, West Orange, and William H. Marks, Clifton, N. J.
Application October 24, 1935, Serial No. 46,470
1 Claim. (Cl. 189—56)



A protecting device of the kind described comprising a plurality of slats arranged in adjacent parallel relation to each other, coiled portions located at opposite edges of said slats, the coiled portions of each slat extending in opposite directions and being interconnected and substantially in surface engagement throughout with the coiled portions of adjacent slats whereby said slats are pivotally connected with each other, and flanges located at the free edges of said coiled portions, one flange of each slat projecting from its associated coiled portion in substantial parallel relation to the median plane of the extended slats and the other flange of each slat projecting from its associated coiled portion in oblique relation to said median plane whereby the flanges of interconnected coiled portions co-operate with each other to prevent relative pivotal movement of the slats in one direction materially beyond the surface plane of the extended device and to permit relative pivotal movement of the slats in the opposite direction sufficient to enable the device to be rolled up to an inoperative position.

2,099,409
REFRIGERATING APPARATUS
Lawrence A. Philipp, Detroit, Mich., assignor, by mesne assignments, to Nash-Kelvinator Corporation, Detroit, Mich., a corporation of Maryland
Application May 24, 1934, Serial No. 727,261
5 Claims. (Cl. 62—89)

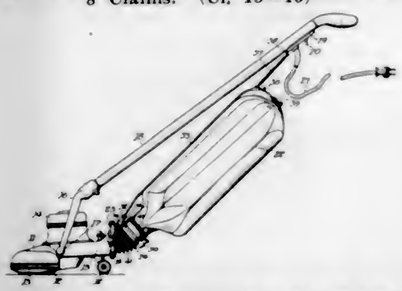


4. In combination, a heat insulating refrigerator cabinet, a cooling unit mounted in said cabinet, a baffle plate supported under said unit, a strip of paper on the upper surface of said baffle plate, and an odor absorbing substance on said paper.

2,099,410
LAMINATED RIM CONSTRUCTION AND METHOD OF MAKING THE SAME
Creighton W. Ryerson, Jackson, Mich., assignor to Ryerson & Haynes, Inc., Jackson, Mich., a corporation of Michigan
Application October 27, 1934, Serial No. 750,264
5 Claims. (Cl. 301—97)

4. A laminated bicycle rim or the like comprising a relatively thick metallic section having tire retaining flanges having flared edges, a relatively thin metallic split shell resistant to corrosion conforming to and capping the outer exposed surface of said section, the edges of said shell embracing said flared edges and terminating contiguously with the tire walls, and means for preventing relative circumferential movement between said shell and rim section, said means comprising an abutment engaging the ends of a shell at the split.

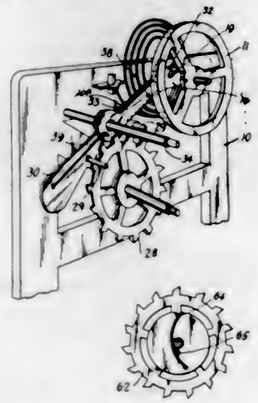
2,099,411
MACHINE FOR MAKING AND ATTACHING WIRE BASKET HANDLES OR THE LIKE
Albert H. Schmidtke, St. Joseph, Mich., assignor to St. Joseph Iron Works, St. Joseph, Mich., a corporation of Michigan
Application April 11, 1936, Serial No. 73,887
16 Claims. (Cl. 140—93)



1. In an apparatus for forming and attaching bail shaped wire members, the combination of guiding means with spaced channels and mechanism cooperable therewith to bend a length of wire into the form of a bail with spaced legs having attaching portions extending laterally from the ends thereof in said channels of the guiding means, closing means at the open sides of said channels for confining said attaching portions of the bail therein, driving facilities by which said attaching portions of the bail are propelled along and expelled from the channels, said mechanism being operable to position portions of the legs of the bail between the driving facilities and the channel closing means as the legs are brought to their spaced relation in the bail forming operation, and said closing means being withdrawn from the open sides of the channels in a manner to progressively shorten the closed portions of the channels as the attaching portions of the bail are propelled along and expelled therefrom by the driving facilities.

2,099,412
DISPENSING CONTAINER
Carl Seidler, New York, N. Y.
Application March 9, 1936, Serial No. 67,824
9 Claims. (Cl. 221—60)

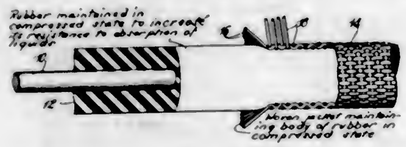
1. In a device of the character described, a pliable and collapsible container adapted to store a plastic substance therein, said container terminating at one end in an apex, a pouring spout arranged in the container adjacent the apex and means whereby a portion of the apex may be torn from the container to thereby operatively dispose the said spout against the container outwardly thereof.



2,099,413
SUCTION CLEANER
Harry B. White, Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio
Application July 31, 1931, Serial No. 554,271
8 Claims. (Cl. 15—16)

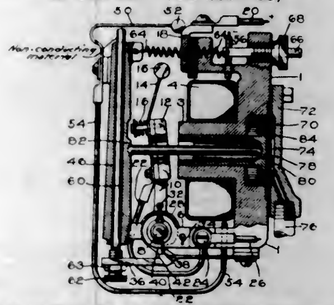
1. A coupling and supporting device for attachment of a dust filtering bag to a suction cleaner comprising a pair of rings hinged together, a flexible tubular member connecting said rings, an arm rigidly connected to one of said rings and adapted to support one end of the bag, and means on said ring for detachably connecting the other end of the bag thereto.

8. A flexible member for connecting a dust filtering bag to the outlet of a suction cleaner, comprising a tube of resilient material having straight end portions and formed with a circumferentially extending corrugation between said end portions, the normal formation of said member when free from strain being such that the end portions of said member are disposed at an angle to each other to form a bend, the radial depth of said corrugation increasing in both directions from a minimum on the inside of said bend to a maximum on the outside of said bend.



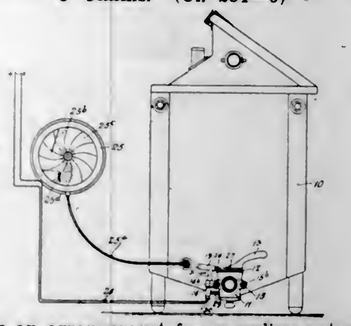
2,099,414
CLOCK
Richard H. Whitehead, New Haven, Conn.
Application August 8, 1934, Serial No. 738,958
2 Claims. (Cl. 58—121)

1. In a clock in combination, a balance wheel, a shaft, an escapement lever carrying pallet pins, mounted on said shaft, a fork lever adapted to be engaged by the balance wheel for operating said escapement lever and pivoted to the escapement lever distant from the shaft and a resilient connection between said fork lever and said escapement lever.



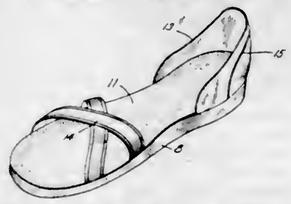
2. In a clock in combination, an escapement lever carrying pallet pins, an escapement wheel shaft, an escapement wheel loosely mounted on said shaft, a disc fixed upon said shaft of smaller diameter than said escapement wheel carrying an abutment, a pin upon said escapement wheel in the path of said abutment, and a spring holding said pin in contact with said abutment, except when the movement of said escapement wheel imparts a blow to one or the other of the pallet pins, said disc exerting sufficient friction against said escapement wheel to dampen any oscillation between the escapement wheel and its shaft.

2,099,415
PROTECTIVE JACKET FOR CONDUCTORS OR CABLES
Hans V. Wodtke, Plainfield, N. J., assignor to Anaconda Wire & Cable Company, New York, N. Y., a corporation of Delaware
Application April 17, 1934, Serial No. 720,963
3 Claims. (Cl. 173—264)



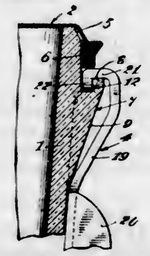
1. A conductor having an outermost closely woven fibrous jacket and a body of rubber wholly enveloped and maintained in a state of compression about the conductor by said jacket so as to render the rubber body more highly resistant to the absorption of liquids than in would be if the herein recited elements were not so combined.

2,099,416
COMPRESSOR GOVERNOR
Burton S. Aikman, Wilkinsburg, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application May 15, 1936, Serial No. 79,937
18 Claims. (Cl. 200—83)



1. In a switch device, in combination, a switch movable between an open position and a closed position, yielding means urging the switch to one of said positions, electro-responsive means for moving the switch against the yielding means, latch means for preventing movement of the switch by the yielding means, biasing means, said switch device having a chamber adapted to contain fluid under pressure, and means subject to the opposing pressures of the fluid in said chamber and of said biasing means for controlling said latch means and for also controlling the supply of current to the electro-responsive means.

2,099,417
HEAT-PROCESSING RECORDER
Frank J. Bast, Queens Village, N. Y., assignor to Charles J. Tagliabue Mfg. Co., Brooklyn, N. Y., a corporation of New York
Application January 2, 1932, Serial No. 584,352
3 Claims. (Cl. 234—6)

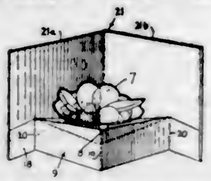


1. In an arrangement for recording automatically the temperature and time of discharge of a fluid from an apparatus for heat-processing the fluid, the combination with an instrument for recording the then temperature of the fluid; means sensitive to the temperature of the fluid and operatively connected with said instrument; said instrument including means for recording the temperature on a chart and an electric motor for driving the chart; an electric circuit for operating said motor; and a discharge valve associated with said apparatus: of a switch actuated by said valve and connected in said circuit for controlling the operation of said motor, said switch being arranged to open said circuit upon the opening of said valve.

2,099,418
WATERPROOF BATHING SANDAL
Charles E. Bradley and Kenneth L. Keene, Mishawaka, Ind., assignors to Mishawaka Rubber and Woolen Manufacturing Company, Mishawaka, Ind., a corporation of Indiana
Application May 8, 1933, Serial No. 669,862
3 Claims. (Cl. 36—11.5)

2. A water-proof bathing sandal, comprising a sole-body of sponge rubber, a wear-resisting rubber-stock tread-layer vulcanized upon the bottom of the body of sponge rubber, a non-absorbent foxing covering and having a water tight connection with the peripheral edge of the sponge rubber and having its upper edge turned in across and secured to the top face of the sponge rubber, a non-absorbent insole covering and secured to the top of the sponge rubber and overlapping the inturned portions of the foxing, the insole, foxing and tread-layer being thin and pliable and constituting a non-absorbent envelope snugly enclosing the sponge rubber, said envelope and sponge rubber being vulcanized together and constituting a composite sole having the soft, pliable, and yielding characteristics of the sponge rubber, and a skeleton upper having its lower edge turned in and secured between the edge of the insole and the inturned edges of the foxing, said composite sole and upper being vulcanized to effect a water-tight connection between associated parts.

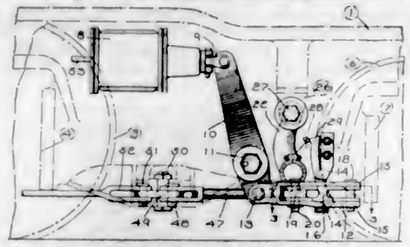
2,099,419
SEALED PACKAGE
Banks D. Brown, Connellsville, Pa., assignor to Capstan Glass Company, Connellsville, Pa., a corporation of Delaware
Application August 1, 1933, Serial No. 683,133
5 Claims. (Cl. 215—46)



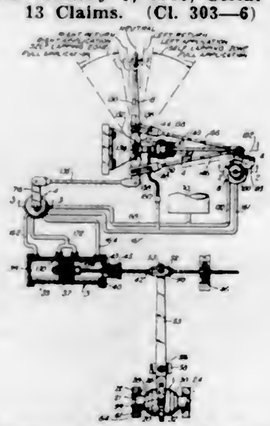
1. As an article of manufacture, an opener comprising a handle part made of flat material, portions at one end of the handle part being bent at substantially right angles to the plane of the handle, the other end of the handle part being offset to form a fulcrum part, a portion bent downwardly from the plane of the fulcrum part and in the direction of the handle, and upwardly extending prong-shaped portions at the ends of the downwardly depending part for engaging and piercing a gasket within a closure cap sealed to a glass container, said prong-shaped portions be-

ing adapted to vent the package and thereafter remove the closure from the container.

5. A sealed package comprising in combination, a glass container having a side wall sealing zone adjacent the upper end thereof adapted to fit within the skirt of a closure cap and having an integral radially outwardly extending circumferential projection spaced a slight distance below said sealing zone, said projection having a substantially horizontal upper surface with an end corner substantially perpendicular to the side wall of the container to serve as a fulcrum for a pry-off tool and to minimize the tendency of the prying tool to be forced out of its operating position when a closure cap is being pried from the container, and an outer side surface tapered downwardly and inwardly to merge into the side wall of said container, the outer side surface being of substantial length and longer than the distance the upper surface projects outwardly, and a closure cap having a sealing gasket in the skirt thereof, said skirt being reformed to compress said gasket between said sealing zone and the skirt of the cap to form a seal with the lower edge of the skirt of the cap adjacent to the upper surface of said projection in sealed position.



2,099,420
DISPLAY
Claude Carey Cloud, Chicago, Ill.
Application June 19, 1936, Serial No. 86,135
7 Claims. (Cl. 40—126)

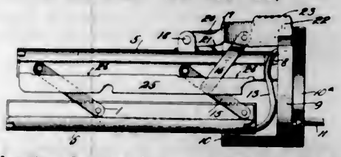


1. A display of predetermined configuration including a forepart, a back part, and an intermediate part, each of said parts being divided into sections by fold lines extended thereacross, one section of the intermediate part being connected to a section of the forepart and to a section of the back part along fold lines, another section of the intermediate part being connected to another section of the back part along a fold line and having a tab connected thereto along the fold line, said tab being adhesively connected to another section of the forepart, said forepart and said back part being folded along the fold lines therein in the completed display to dispose the sections thereof in substantially vertical planes and also to dispose the sections of each of said parts in angular relation with each other, said intermediate part being disposed in a substantially horizontal plane when the sections of the forepart and the back part are disposed in vertical planes.

2,099,421
BRAKE RIGGING
Theodore C. Crossman, Wilkinsburg, Pa., assignor to The American Brake Company, Wilmerding, Pa., a corporation of Missouri
Application June 13, 1936, Serial No. 84,998
20 Claims. (Cl. 188—33)

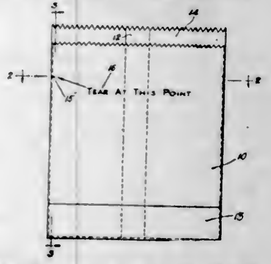
1. In a railway vehicle, in combination, a frame, a wheel and axle assembly arranged for lateral movement relative to said frame and having a braking surface movable therewith, a brake element carried by said frame and being movable into and out of braking engagement with said braking surface, means permitting lateral movement of said element from a normal position with said assembly when the element is in engagement with said braking surface, and means for moving said element from an abnormal lateral position to its normal position upon movement of said element out of braking engagement with said braking surface.

2,099,422
PNEUMATIC CLUTCH CONTROL DEVICE
George C. Farmer, Chicago, Ill., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application January 9, 1936, Serial No. 58,352
13 Claims. (Cl. 303—6)



1. In a control system for a pair of friction clutch elements having associated therewith movable abutment means subject to and operated on an increase in the pressure of the fluid supplied thereto to move said clutch elements into operative engagement, said system comprising valve means for supplying fluid under pressure to said movable abutment means, said valve means having an actuating element having a normal position, the valve means being operative to supply fluid under pressure at pressures which vary in accordance with the amount of movement of the said actuating element from the normal position, a manually operable member having a normal position, means for moving the actuating element of the valve means away from its normal position in accordance with movement of the manually operable member away from its normal position, and a movable abutment subject to the pressure of the fluid supplied by the valve means and opposing movement of the manually operable member from the normal position.

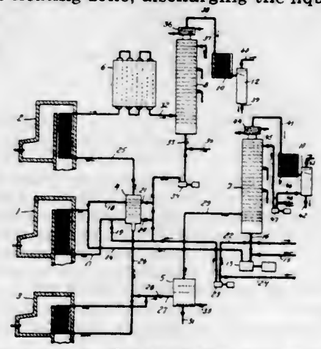
2,099,423
COATING COMPOSITION
Gustave D. Fortman, Philadelphia, Pa.
No Drawing. Application January 28, 1936
Serial No. 61,178
2 Claims. (Cl. 134—46)



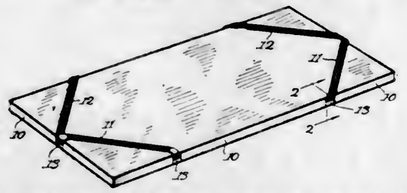
1. A dry mixture, adapted to be mixed with a liquid to form a coating composition, including the following ingredients in substantially the following proportions, 50 parts by weight of whiting, from 1 to 5 parts by weight of cold water paste, and from 1 to 5 parts by weight of powdered asbestos.

2,099,424
HAIR WAVING HEATER
Ernest O. Frederics, Bronxville, N. Y., assignor to E. Frederics, Inc., New York, N. Y., a corporation of New York
Application May 29, 1933, Serial No. 673,344
9 Claims. (Cl. 132—36)

1. A heater for use in imparting a spiral wave to hair, comprising a pair of opposed heating elements, a handle rigidly secured to one end of one of said elements, and means for moving the other element with respect to the element rigid with the handle while positively maintaining the same angular relation between them, said means including a device for yieldingly urging the elements toward one another.



2,099,425
BAG CONSTRUCTION
Leon Goodman, Chicago, Ill., assignor to Crystal Tube Mfg. Co., Chicago, Ill., a corporation of Illinois
Application April 20, 1936, Serial No. 75,283
2 Claims. (Cl. 229—66)

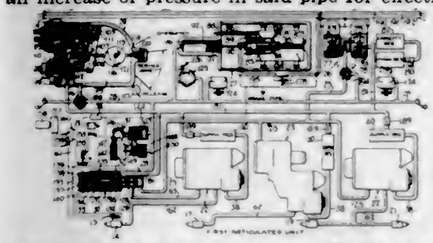


2. A bag-like container for candy or the like comprising a flattened cylinder or tube formed from a tough flexible transparent sheet of cellulose material, the lower end portion of said tube being doubled upon itself and secured in position to close such lower end, said flattened tube having a small weakened portion not readily visible to the eye at one edge thereof adjacent the opposite end portion to facilitate tearing the container for ready removal of its contents, and a notation on said tube indicating the position of said small weakened portion.

2,099,426
ART OF CRACKING HYDROCARBONS
Eugene C. Herthel, Flossmoor, Ill., assignor to Sinclair Refining Company, New York, N. Y., a corporation of Maine
Application April 23, 1932, Serial No. 607,091
6 Claims. (Cl. 196—48)

2. In the manufacture of gasoline, the improvement which comprises forcing a stream of higher boiling petroleum oil through a heating zone into a separator maintained under a superatmospheric pressure upwards of about 600 pounds per square inch and heating the oil to a severe cracking temperature in the heating zone, maintaining the separator at a temperature low enough to maintain liquid under the prevailing pressure a substantial part of the gasoline constituents formed in the heating zone and separating a gas mixture from liquid material in the separator, forcing this separated gas mixture through a separate heating zone by means of the pressure maintained in the separator and heating the gas mixture to a cracking temperature under a substantial superatmospheric pressure in the separate heating zone, discharging the liquid material separated in the separator into an evaporator maintained under a pressure substantially lower than that under which the separator is maintained and thereby vaporizing lower boiling constituents, separately taking off from said evaporator the lower boiling constituents vaporized therein, and condensing and collecting the gasoline constituents so vaporized from the separated liquid material and those formed from the separated gas mixture.

2,099,427
BEDDING PAD
Charles D. Karr, Holland, Mich.
Application July 13, 1934, Serial No. 734,961
1 Claim. (Cl. 5—322)

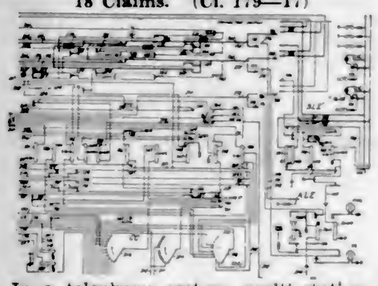


A bedding pad having marginal panels, and corner straps attached thereto, the panels having adjacent to each corner of the pad, upper and lower inserts, having instanding disconnected flaps at their adjacent edges, the strap ends entering between such flaps and being stitched thereto on lines inclined toward the ends of the strap from the margin thereof adjacent to the corner of the pad.

2,099,428
TRAIN BRAKE SYSTEM
John W. Logan, Jr., Forest Hills, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application February 29, 1936, Serial No. 66,417
29 Claims. (Cl. 303—3)

1. In a combination train comprising a plurality of independent train units coupled together, in combination, a brake equipment for

each of said train units comprising at least brake means for operating the brakes on that unit, a source of energy supply independent of the source of supply on any of the other train units, a pipe normally charged with fluid under pressure, means operating upon a reduction of pressure in said pipe for effecting operation of said brake means to apply the brakes, and operative upon an increase of pressure in said pipe for effecting

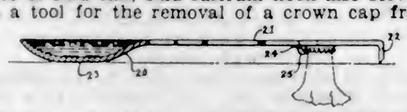


operation of said brake means to effect a release of the brakes; means on one of said train units for maintaining said pipe normally charged with fluid under pressure and for effecting a reduction of pressure in said pipe; and means on one or more of said train units operating in response to reduction of pressure in said pipe for controlling the rate of retardation produced by operation of said brake means on each of said train units.

2,099,429
AUTOMATIC TELEPHONE SYSTEM

John E. Ostline, Berwyn, Ill., assignor to Associated Electric Laboratories, Inc., Chicago, Ill., a corporation of Delaware

Application May 7, 1934, Serial No. 724,238
18 Claims. (Cl. 179—17)



1. In a telephone system, multi-station subscribers' lines, trunk lines, a connector switch having access to said lines, auxiliary means, associated with said connector, controlled by impulses transmitted from the station of a calling line in accordance with a digit of a desired called line to enable said connector to subsequently supply signalling current to the proper conductor of such called line in accordance with the station being called, means for automatically transferring the control from said auxiliary means to said connector before the final impulse of such digit has been transmitted in case the called digit identifies a trunk call so that at least such final impulse will control said connector, and means for then causing said connector to automatically hunt for an idle one of said trunk lines.

2,099,430
CAN OPENER

Thomas S. Quea, Watertown, Conn.

Application October 17, 1936, Serial No. 106,137
1 Claim. (Cl. 30—16)

In a culinary implement having a handle, one end of said handle having an upstanding pointed cutter member, said handle being provided adjacent one end thereof with a fulcrum hook for engaging the rim of a beaded metal can to permit said cutter member to be forced into the end face of said can, said fulcrum hook also serving as a tool for the removal of a crown cap from

a bottle, said cutter member being normal to said handle and of sufficient length to hold said implement in substantially horizontal position and also having the function of forming a support for said implement when the latter is resting on a horizontal surface.

2,099,431
SWEATER

Henry Reeb, Brooklyn, N. Y., assignor to Friendly Knitting Mills, Inc., Brooklyn, N. Y., a corporation of New York

Application December 28, 1936, Serial No. 117,755
1 Claim. (Cl. 2—126)

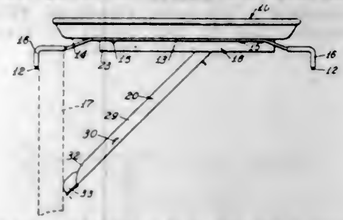
In a knitted garment, a main body portion having arm openings encircled by relatively loosely knitted marginal edges, sleeves attachable to said main body portion, said sleeves having loosely knitted marginal edges abutting the marginal edges of the main body portion, the abutting portions of the marginal edges of the sleeves and the marginal edges of the main body portion having substantially the same peripheral dimensions and ribbons or cords passing through the loosely knitted marginal edges for detachably securing the sleeves in non-overlapping positions with relation to the main body portion.

2,099,432
REACTION PRODUCTS OF GLYCOLS AND ALKALOIDS

Samuel Ruben, New Rochelle, N. Y.

No Drawing. Application January 31, 1936, Serial No. 61,808
7 Claims. (Cl. 260—25)

1. A therapeutic composition comprising essentially the water soluble reaction product of a glycol and an alkaloid of the following group: quinine, strychnine, codein and ephedrine.

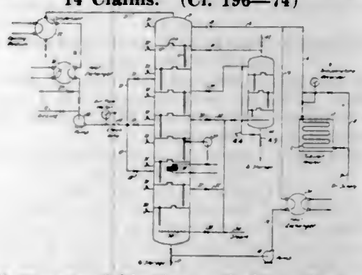


2,099,433
SERVICE TRAY

Samuel Bloomfield, Chicago, Ill.

Application September 18, 1936, Serial No. 101,408
2 Claims. (Cl. 311—22)

1. A service tray having secured thereto means adapted for detachable connection to the upper edge of a vehicle door and adjustable brace

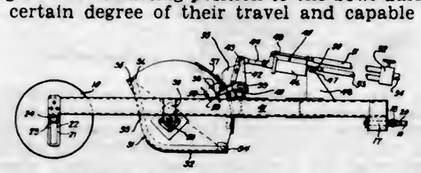


means including an elongated channel member attached to the bottom of said tray and having opposite edge portions formed to provide oppositely disposed longitudinally extending grooves, an elongated brace arm of channel shaped cross section receivable in said channel member between said grooves thereof, a pin extended laterally through an end of said brace arm and having its ends received in said opposite grooves, said end of the brace arm being slanted to permit moving said arm about said pin as an axis from a position substantially within said channel member into a position at substantially 45 degrees thereto, and means at the ends of said channel member for preventing movement of said brace arm and pin means out of axial ends thereof.

2,099,434
PROCESS FOR TREATING HYDROCARBONS

Albert B. Culbertson, Jr., St. Louis, Mo., assignor, by mesne assignments, to The Standard Oil Company, Chicago, Ill., a corporation of Indiana

Application March 6, 1935, Serial No. 9,577
14 Claims. (Cl. 196—74)



6. A process of blowing asphalt-producing petroleum base materials comprising, introducing a stream of material to be treated at an elevation into a reaction chamber, separating the stream into pools, said pools having a gravity downward flow, injecting separate currents of an oxidizing gas at selected elevations into the reaction chamber, withdrawing the residual gases from the reaction chamber and recirculating at least a portion thereof through said chamber, withdrawing the oxidized petroleum base material from the reaction chamber and recirculating at least a portion thereof through the reaction chamber.

2,099,435
COMBINED CARRIER SCRAPER

Ralph M. Davenport, Los Angeles, Calif.

Application April 2, 1935, Serial No. 14,253
3 Claims. (Cl. 37—140)

3. A device of the character described comprising a rigid main frame having opposite side rails, the forward end of said main frame being adapted to be supported by a tractor, ground wheels supporting the trailing ends of the side rails, a bowl mounted between said side rails for rotation around a horizontal axis, said bowl having a floor and a back wall, the opposite ends being closed, a cutting blade carried at the forward edge of said floor portion, a stop member carried by the bowl, a transverse shaft mounted on the main frame in advance of the bowl, a pair of locking dogs fixed to the transverse shaft and adapted to be swung as the shaft rotates, said dogs standing in an obstructing position to the bowl during a certain degree of their travel and capable of

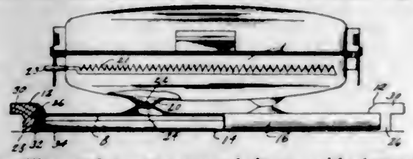
moving with the stops to adjust the bowl and to swing free of the stops to permit rotation of the bowl, and a spreading cam on the transverse shaft at a point intermediate its ends and adapted to be moved to an obstructing position with relation to the upper rear edge of the rear wall of the bowl to limit rotation of the bowl and to cause the blade to form a spreading operation, and means adapted to be remotely controlled to produce desired rotation of the transverse shaft to swing it to its various operative positions.

2,099,436
SHOE

Alfred W. Donovan, Quincy, and Alfred F. Donovan, Boston, Mass., assignors to E. T. Wright & Company, Inc., Rockland, Mass., a corporation of Massachusetts

Application March 8, 1935, Serial No. 10,002
3 Claims. (Cl. 36—8.5)

1. A shoe comprising an upper including a quarter having a lining, an insole and a stiff hard counter having a flange at its lower margin, the rear end portion and one side wall of the counter being covered and concealed by the lining and the lower edge of the counter being anchored in the bottom structure of the shoe, the other side wall of the counter having an extension disposed at the inner side of the lining and which reaches forwardly substantially to the forward end of the shank, the upper comprising a substantially inextensible sling member disposed between the outer member of the upper and the lining, said sling member being permanently anchored at its upper end adjacent to the vent of the upper and having its lower end anchored in the shoe bottom structure, said sling girding the counter extension adjacent to the forward end of the latter and being operative, during lasting the shoe, to draw the flanged margin of the counter extension snugly against the lower part of the last.



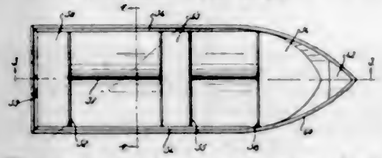
2,099,437
ELECTRICAL APPLIANCE AND BASE

William H. Fischer, St. Louis, Mo., assignor to Knapp-Monarch Company, St. Louis, Mo., a corporation of Missouri

Application June 26, 1936, Serial No. 87,454
14 Claims. (Cl. 53—5)

1. A support for a relatively low electrical appliance comprising a single sheet of substantially

flat material having flanges along two opposite sides thereof, elongated members having grooves receiving the other two sides thereof, said elongated members projecting below the lower surface of said sheet of material to form supporting feet for the material relative to a table top or



the like and means spaced from said elongated members, formed of said sheet material and projecting upwardly from the plane thereof to which the relatively low electrical appliance is rigidly connected for positioning said appliance above and spaced from the sheet of material.

2,099,438

BOAT AND THE METHOD OF CONSTRUCTING THE SAME

Mark L. Gilbert, Holland, Mich., assignor to Gil-Boat Company, Holland, Mich., a corporation of Michigan

Application February 21, 1936, Serial No. 65,019
7 Claims. (Cl. 9—6)

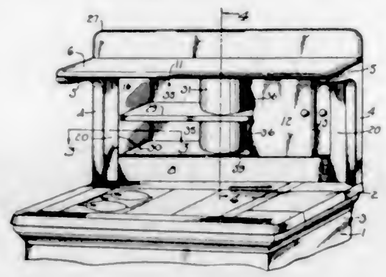
1. The method of forming a portion of a boat body from a single piece of material, consisting in rolling said piece of material into substantially circular form with the edges thereof in slightly separated relation, pressing inwardly said strip of material on a longitudinally extended line, diametrically opposite the space separating the edges, to define a pair of substantially semi-cylindrical portions, and then doubling said portions outwardly upon each other and bending the outer extremities thereof upwardly to provide side walls arcuate in cross section with the concave face directed outwardly.

2,099,439

PASTING PRESS

Leo Goldhammer, Munich, Germany, assignor to Agfa Ansco Corporation, Binghamton, N. Y., a corporation of New York

Application November 11, 1935, Serial No. 49,141
In Germany November 14, 1934
4 Claims. (Cl. 154—42)



1. A pasting press comprising in combination a bed-plate, two rows of film guide pins arranged on said bed-plate at a substantial distance from each other for guiding a film of substandard size, said bed-plate being provided with a pair of openings near each row of film guide pins for registering with two successive perforations of a substandard film, a balance frame arranged on said bed-plate, two pairs of film-engaging pins arranged on said balance frame at places registering with said holes, and means for bringing one of said pairs of film-engaging pins into engagement with one of said pairs of bed-plate openings and through the latter into engagement with the perforations of a film while the other pair of film-engaging pins remains in retracted position.

2,099,440

STOVE

Christopher L. Hardwick, Cleveland, Tenn.

Application May 22, 1937, Serial No. 144,261
4 Claims. (Cl. 126—17)

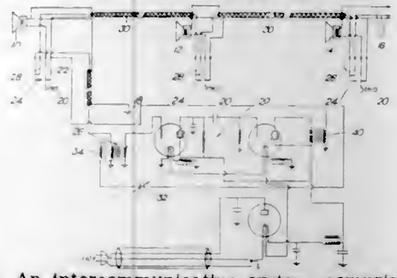
1. In combination with a stove having vertically disposed shelf supports at the rear of the stove, a shelf on said supports overhanging the top of the stove, a warming closet having an open front end secured to the rear of said shelf supports, and doors slidably mounted in said shelf support for closing the open end of said closet and serving as a splash back.

2,099,441

CELLULOSIC PRODUCT AND METHOD FOR PREPARING SAME

Winfield Walter Heckert, Ardentown, Del., assignor, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application September 15, 1934, Serial No. 744,259
4 Claims. (Cl. 106—40)



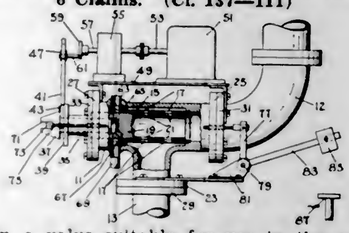
1. Delustered cellulosic articles prepared from cellulosic solutions containing, in a phase distinct from the cellulosic material therein, a finely divided, white, delustering agent comprising a substance having two or more cyclic nuclei highly deficient in hydrogen, said substance taken from the group consisting of di-naphthyl ketone, dibiphenyl ketone, p-phenylbenzophenone, naphthophenone, anthraphenone, acetonanthracene, naphthyl naphthylmethyl ketone, 1,2-dinaphthoyl ethane, 1,4 diacetylnaphthalene, dibenzoylmethane, benzalacetophenone, diphenacyl, benzil, benzoin methyl ether, dibenzoyl benzol, 3-acetonaphthol-1-methyl ether, benzyl biphenyl ketone, methyl ether of o-hydroxyphenylstyryl-ketone, phenyl cumaryl ketone, furfuryl phenone, acenaphthenyl phenyl ketone, benzylidene, desoxybenzoin, dibenzoyl styrene, p p' dichlorobenzylidene-acetophenone, 3,6-dibenzoyl carbazole, 4,benzoyl phthalimide, dibenzthiazyl ether of diphenylol ketone, diphenylene ketone, dinaphthylene ketone, chrysoketone, 2-bromo-9-keto-fluoren, 1-methyl 4-isopropyl diphenylene ketone, 9-keto-2-benzoylfluoren, xanthone, dinaphthoxanthone, euxanthone methyl ether, flavon, acenaphthenone, diethyl anthrone, 1,4 naphthoyl-1,4 dihydronaphthalene, ketone resin prepared by the condensation of 1,4 dihydronaphthalene 1,4-diacyl chloride with benzene.

2,099,442

LOUD SPEAKING TELEPHONE SYSTEM

Hugh A. Howell, Berwyn, Ill., assignor to United Pressed Products Co., Chicago, Ill., a corporation of Illinois

Application August 19, 1936, Serial No. 96,762
2 Claims. (Cl. 179—1)



1. An intercommunicating system, comprising a plurality of combined receiving and transmitting units, and a single amplifier for all the units, together with a special input transformer associated with the amplifier, the special input transformer including a double primary winding, together with a balanced input circuit in the amplifier unit, said input circuit including a variable condenser and switch means for retaining all the units in receiving position.

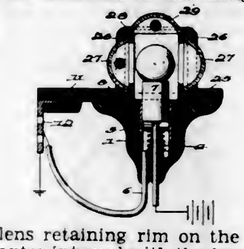
2,099,443

VALVE

Frederick G. Kraft, Richmond, Va., assignor, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

Application October 4, 1935, Serial No. 43,479
6 Claims. (Cl. 137—111)

1. In a valve suitable for use in the control and regulation of viscose and similar fluids, cooperable elements longitudinally movable relatively to each other to effect an opening or closing of said valve, means for continuously oscillating said elements relatively to each other to prevent sticking therebetween, and fluid directing means for passing a cleaning fluid between said elements.



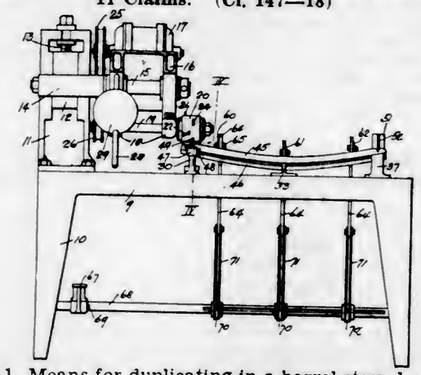
2,099,444

LIGHT CASING

Jesse D. Langdon, Los Angeles, Calif., assignor of two-thirds to George J. Kilgen and Edward W. Todd, both of Los Angeles, Calif.

Application December 4, 1936, Serial No. 114,219
10 Claims. (Cl. 240—7.1)

1. The combination with a lamp casing forming a supporting base provided on its outer face with an annular inturned rim member forming a flange retaining recess normally adapted to receive a lens, a lens adapter including at one end a basal flange member adapted to fit into said flange retaining recess in engagement with said inturned rim, at least one of said last named member being composed of flexible material to facilitate the insertion of the flange within the



recess, a lens retaining rim on the opposite end of said adapter integral with the basal flange, and a lens fitting in said last named rim.

2,099,445

BARREL STAVE CROZER

Jesse W. Leonard, Willard R. Butterworth, Jr., Claud Leonard, Harry A. Wellford, and Walker L. Wellford, Jr., Memphis, Tenn.

Application October 22, 1936, Serial No. 106,938
11 Claims. (Cl. 147—18)

1. Means for duplicating in a barrel stave having one end crozed, a second croze, by means of a pattern stave having both ends crozed; said means including a manually shiftable rotary croze cutter, means for driving said cutter, means for constraining said cutter to move in a circular path, means, adapted to be manually engaged with a first croze of said pattern stave, for longitudinally positioning said pattern stave with the croze to be duplicated in alignment with the cutting zone of said cutter and means for supporting said stave with the bottom of said croze coincident with the circumscribing path of said cutter, said supporting means being adapted to support also said barrel stave to be crozed, means, adapted to be manually engaged with the second croze of said pattern stave and with the croze of said barrel stave, for aligning the crozed end of said barrel stave with the croze at the opposite end of said pattern stave, and means for clamping said pattern and barrel staves during cutting.

2,099,446

ILLUMINATED STREET MARKER

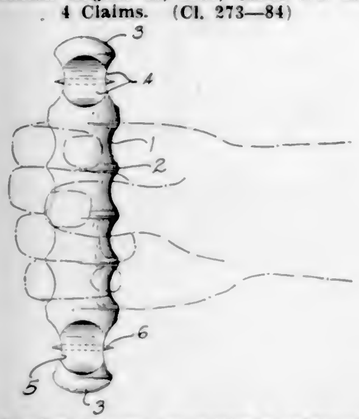
Frank B. Lockert, Dallas, Tex.

Application May 11, 1936, Serial No. 78,988
1 Claim. (Cl. 40—132)

In an illuminated street sign, a casing comprising a pyramidal-shaped top, a plurality of sides and a bottom portion, each side of the

pyramidal-shaped top having an opening provided with a panel of glass carrying a street number, each of the said sides having a square opening provided with a panel of glass carrying advertising matter, the said sides having a second opening of rectangular shape spaced above the said square opening and the rectangular opening

provided with a panel of glass carrying a street name, the said bottom of the casing having a central opening and an incandescent lamp extending through said opening into the casing for illuminating the panels of glass, and a supporting post to which the said bottom of the casing is secured.



2,099,447

POLICE WEAPON

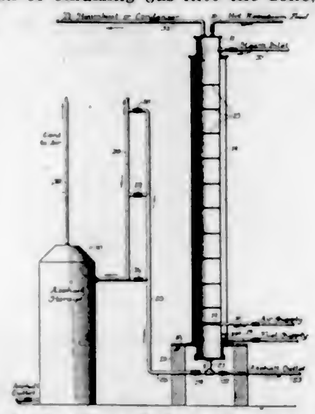
Frank A. Matsuyama, San Francisco, Calif.

Application August 20, 1937, Serial No. 160,030

4 Claims. (Cl. 273—84)

1. A police weapon comprising a substantially cylindrical body having a ridged handle portion of a size to be readily grasped by the hand, and portions extending beyond the hand and terminating in rounded striking surfaces, and angular faces joining to form sharp edges between the handle portion and said rounded striking surfaces.

2,099,448



ASPHALT OXIDATION

Claude P. McNeil, Whiting, Ind., and Samuel A. Montgomery, Wood River, Ill., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

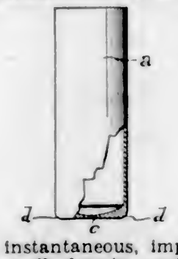
Application December 18, 1929, Serial No. 415,096

5 Claims. (Cl. 196—74)

5. The process of continuously producing blown asphalt which comprises introducing petroleum base material into a reaction zone, causing the material to be formed into a plurality of spaced pools and to flow from pool to pool, introducing a stream of oxidizing gas into the zone, causing

said gas to flow through the material in the pools and controlling the temperature of the reaction zone independently of the temperatures of the petroleum base material and oxidizing gas entering the zone.

2,099,449



METHOD OF MAKING DRY CELLS

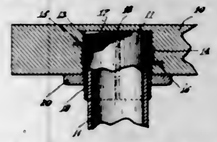
Otto Metzger, Nuremberg, Germany, assignor to Vereinigte Deutsche Metallwerke Aktiengesellschaft, Nuremberg, Germany, a company of Germany

Application November 26, 1934, Serial No. 754,805

In Germany November 14, 1931

4 Claims. (Cl. 207—10)

1. The cold, instantaneous, impact extrusion method of backwardly forming an integral hollow zinc container with a closed end which comprises placing a disc-like plate of rolled zinc in a closed cavity without preheating said plate, impacting said zinc plate in said cavity at room temperature of about 15° C. to about 20° C. with one blow of a solid plunger almost filling said cavity and only leaving a small open annular space, said impacting being effected without a lubricant and instantaneously with an extremely high pressure of about 142,000 to about 284,000 pounds per square inch whereby the extrusion of zinc is effected in a direction opposite to the movement of the plunger so speedily that it is not visible with the naked eye and whereby an integral hollow zinc container with a closed end and with smooth and mirror-like surfaces is formed with an extraordinarily dense and homogeneous structure and with excellent electrolytic qualities and greatly increase life, and discontinuing the application of pressure after said one sudden impact blow has been effected momentarily.



2,099,450

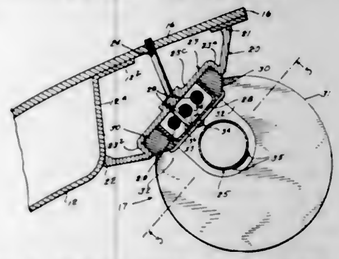
ARTICLE OF FURNITURE

Paul Meyer, New York, N. Y.

Application February 11, 1937, Serial No. 125,194

10 Claims. (Cl. 311—111)

1. An article of furniture having a top slab provided with a plurality of sockets therein, a spirally wound wire having inclined surfaces, embedded in and secured to the wall of each socket whereby wedge-like surfaces are provided within the socket, a constrictible tubular member having exterior wedge-like surfaces adapted to co-operate with the wedge-like surfaces within each socket, and having a screw threaded portion exposed outwardly of said socket, a leg adapted to penetrate each tubular member, and a nut engageable with the screw threads upon each tubular member, whereby longitudinal movement may be imparted to said member to cause the constriction of said member upon said leg.



2,099,451

VEHICLE LIGHTING

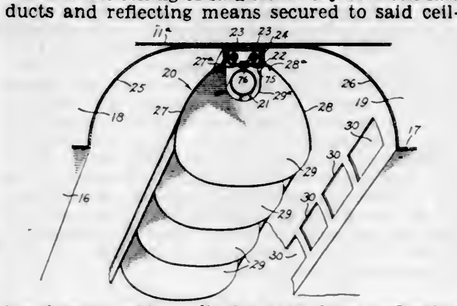
Lindsley Schepmoes, New Haven, Conn., assignor to The Safety Car Heating & Lighting Company, a corporation of New Jersey

Application April 2, 1935, Serial No. 14,267

8 Claims. (Cl. 240—7.35)

1. In a lighting system for railroad cars or the like, in combination, a roof including a ceiling portion at a level lower than the top of said roof, an intermediate portion between said ceiling portion and said roof and forming an angle with said roof, a supporting member bridging said angle and having flanges secured respectively to said roof and said ceiling portion, a tubular illuminating member detachably associated with said supporting member, a plurality of disk-like reflectors disposed about said illuminating member, said reflectors being spaced from one another, and means detachably securing said reflectors to said supporting member.

2,099,452



LIGHTING SYSTEM

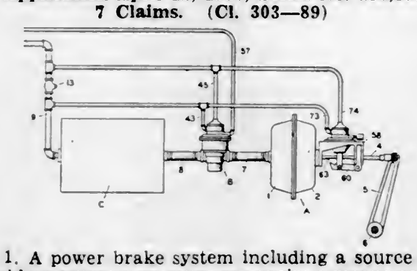
Lindsley Schepmoes, New Haven, Conn., assignor to The Safety Car Heating & Lighting Company, a corporation of New Jersey

Application April 2, 1935, Serial No. 14,268

8 Claims. (Cl. 240—7.35)

1. In lighting apparatus for railroad cars or the like, in combination, a car including a clerestory and a pair of air ducts disposed on opposite sides of said clerestory and extending longitudinally of the car, an elongated illuminator secured to the ceiling of said clerestory between said ducts and reflecting means secured to said ceil-

ing forming side walls for said ducts reflecting light rays emanating from said illuminator.



2,099,453

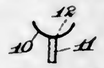
AIR BRAKE CONTROL SYSTEM

Dudley F. Searle, Oakland, Calif.

Application April 12, 1937, Serial No. 136,400

7 Claims. (Cl. 303—89)

1. A power brake system including a source of fluid pressure; a pressure reservoir; a means connecting said reservoir to said source; means for preventing loss of pressure from said reservoir through the connecting means; fluid pressure means for actuating the brakes connected with said reservoir; a valve interposed between said actuating means and said reservoir; means for locking said brake actuating means in operative position; control means connected to said coupling and adapted to open said valve and to operate said locking means when the pressure in said connecting means falls below a given point.



2,099,454

DENTAL MATRIX

Ivar E. Siqveland, St. Paul, Minn.

Application March 25, 1935, Serial No. 12,873

4 Claims. (Cl. 32—63)

1. A matrix for filling dental cavities including a flexible plate formed to the curvature of the tooth, and a hollow shank secured thereto providing an opening entirely through the shank and plate.

2,099,455

CELLULOSIC ARTICLE OF MANUFACTURE AND METHOD FOR PREPARING SAME

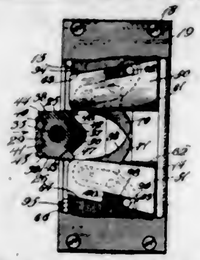
Daniel E. Strain, Wilmington, Del., assignor, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application September 28, 1934, Serial No. 745,976

2 Claims. (Cl. 106—40)

1. A cellulosic structure containing a finely divided delustering agent taken from the group

consisting of 1,1'-binaphthyl 2,2'-dibutyrate, di-beta-naphthyl succinate, 1,1'-binaphthyl 2,2'-dibenzoate, di-biphenyl ester of trans-hexahydro phthalic acid, di-alpha-naphthyl phthalate, 1,1'-dinaphthylmethane 3,3'-dibenzoate, 1,1'-dinaphthylmethane 3,3'-dibenzenesulfonate, beta-naphthyl ester of naphthofurane-1-carboxylic acid, di-biphenyl ester of biphenylphosphonic acid, tri-biphenyl phosphate, tri-beta-naphthyl-phosphate, di-beta-naphthyl carbonate, di-alpha-naphthylmethyl phthalate, di-benzoate of 3,5 hydroxyphenyl-phenyl sulfone, di-benzoate of 4 benzoylamino-1,3-dihydroxy benzene, di-beta-naphthoate of 4-beta-naphthoyl amino-1,3-dihydroxy benzene, ditertiary butyl ester of 1,1'-bi(2-naphthoxyacetic acid).



2,099,456

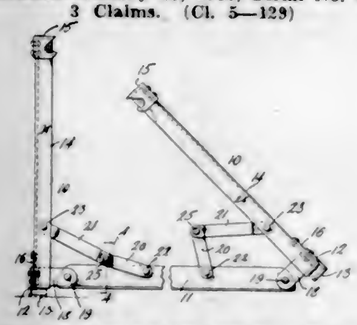
DOOR LATCH

Herbert P. Sweet, Providence, R. I.

Application April 14, 1936, Serial No. 74,316

26 Claims. (Cl. 292—340)

1. A keeper device for the latch bolt of a door comprising a casing, a support therein presenting spaced inclined surfaces, and spaced opposed wedge-shaped clamping members slidable in said casing along said inclined surfaces for movement both outwardly and towards said bolt to engage and hold the latter against movement in one direction.



2,099,457

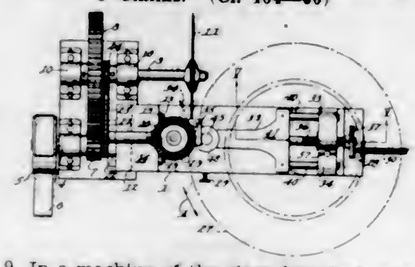
FRAME FOR GLIDERS AND THE LIKE

Joseph M. Vallone, Buffalo, N. Y., assignor to Barcalo Manufacturing Company, Buffalo, N. Y.

Application January 25, 1936, Serial No. 60,875

3 Claims. (Cl. 5—129)

1. A folding frame for gliders and the like comprising an end standard having a channel post with inwardly directed side flanges, and a central longitudinal member to which the standard is connected to fold towards the longitudinal member and which longitudinal member has an upstanding vertical flange, and a brace between the standard and the longitudinal member for holding the standard upright, said brace comprising a pair of parallel links pivoted to said vertical flange of the longitudinal member at opposite sides thereof and bearing flat against said opposite sides throughout a substantial portion of the length of the links, and a second pair of links jointed to said first links and diverging therefrom towards and pivoted to said side flanges of the standard post.



2,099,458

MACHINE FOR REMOVING TIRE TREADS

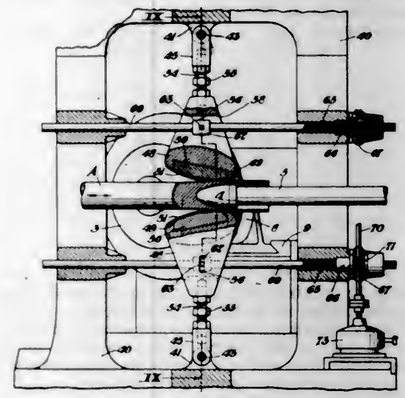
William C. Althen, Columbus, Ohio

Application November 20, 1935, Serial No. 50,732

9 Claims. (Cl. 164—60)

9. In a machine of the class described, a base, a fulcrum stud arising vertically from said base, a bracket having an elongated opening formed therein for the reception of said stud, said bracket being rotatable about the axis of said stud and longitudinally movable with respect to said base to a limited degree controlled by the length of the opening formed in said bracket for the reception of said stud, a pressure applying arm carried by and radially adjustable with respect to said bracket, a screw journaled in a threaded bearing carried in said bracket and connected with the inner end of said arm for regulating the radial adjustment of the latter, antifriction means carried by the outer end of said arm and disposed for engagement with the inner side of a tire casing, and an element carried by said bracket and receivable within a recess formed in said base when said antifriction means are in pressure applying engagement with a tire casing to prevent rotation of said bracket about the axis of said stud.

2,099,459



APPARATUS FOR MAKING PIPES AND TUBES

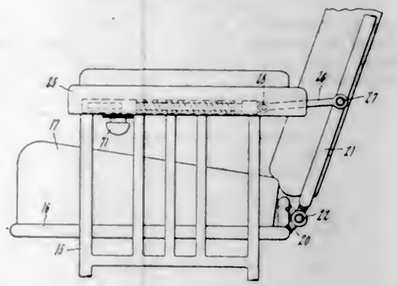
Bryant Bannister, Mount Lebanon, Pa., assignor to National Tube Company, a corporation of New Jersey

Application November 27, 1935, Serial No. 51,901

2 Claims. (Cl. 80—13)

1. Apparatus for forming metallic tapered blanks comprising, in combination, a plurality of metal-working rolls which are constructed and arranged to helically advance a work-piece in a continuous manner, and at least one guide member disposed to present its guiding surfaces to that portion of the work-piece which is in the pass of said metal-working rolls, said guide member being capable of only limited swinging movement in a plane through the axis of the work-piece to present different longitudinal portions of its guiding surface thereto, the guiding surface of said guide member having a groove of varying diameter which is longitudinally curved on an arc having its focus offset with respect to the axis about which said guide member swings, thereby producing a guide pass of varying size, and means for imparting swinging movement to said

guide member during the passage of the work-piece between said metal-working rolls.



2,099,460

RECLINER MECHANISM FOR CHAIRS

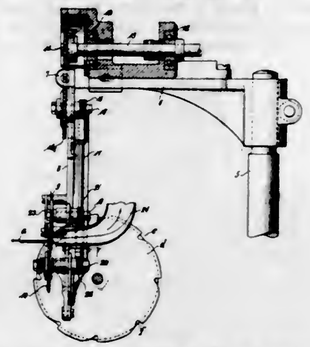
Alfred B. Bell, Gardner, Mass., assignor to Heywood-Wakefield Company, Gardner, Mass., a corporation of Massachusetts

Application May 29, 1935, Serial No. 24,015

1 Claim. (Cl. 155—163)

In a recliner mechanism for a seat having a side arm and a rockable back thereon, a slidable member connected to said back and slidable in said arm in a front and rear direction, said member having in the forward end portion thereof an elongated chamber of limited length and a slot opening into said chamber from the bottom of said member, said slot being narrower than said chamber but having a plurality of widened portions spaced therealong, a locking plunger carried by said arm and movable at right angles to the direction of movement of said member to and from a position of locking engagement with said member, said plunger having a locking element adapted to fit into any one of said widened portions of said slot to lock the member against movement, said plunger having a stem portion adapted to ride in said slot when the locking element is moved clear of said widened portions of the slot, whereby the range of movement of said member is limited.

2,099,461



FABRIC TREATING MACHINE

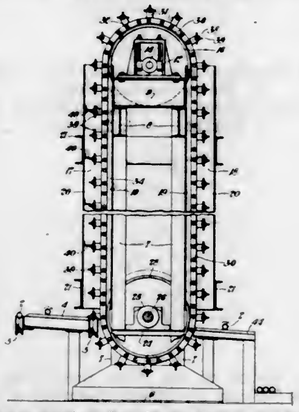
Ernst Bernstein, Dresden, Germany, assignor to A. Monforts, Gladbach-Rheydt, Germany, a corporation of Germany

Application February 18, 1937, Serial No. 126,359

In Germany March 5, 1934

6 Claims. (Cl. 26—7)

1. In a device for cutting off the weft threads of selvedges, a drive shaft, a stationary bearing for said drive shaft, a pendent support, a member rigid with said bearing upon which said support is mounted so as to be capable of swinging freely toward and away from the edge of the cloth about an axis above the cloth, cutting means on said support adapted to cut off the weft threads immediately adjacent the selvedge, and power transmitting mechanism connecting said cutting means to said drive shaft so as to be driven thereby.

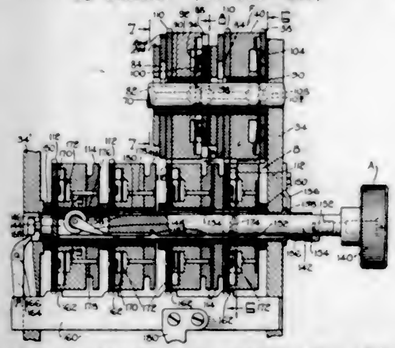


2,099,462

APPARATUS FOR DRYING PIPE COATINGS

John J. Boax, McKeesport, Pa., assignor to National Tube Company, a corporation of New Jersey

Application August 26, 1936, Serial No. 98,039



7 Claims. (Cl. 34—12)

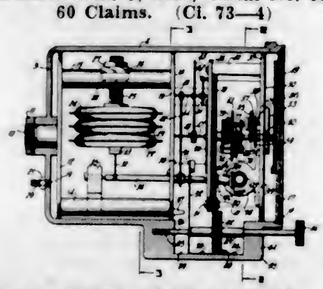
2. An apparatus for drying pipe coatings comprising a pipe drying chamber, means for conveying said pipe through said drying chamber, means carried by said conveying means for supporting said pipe in its travel through said drying chamber, means for rotating said pipe on said conveying means during its travel through said

drying chamber and means for releasing said pipe from said supporting means at the discharge side of said pipe drying chamber.

2,099,463
REGISTER
Richard C. Bradley, Brooklyn, N. Y., assignor of one-half to Fred J. Bradley, St. Albans, N. Y.
Application November 22, 1933, Serial No. 699,120
15 Claims. (Cl. 235—132)

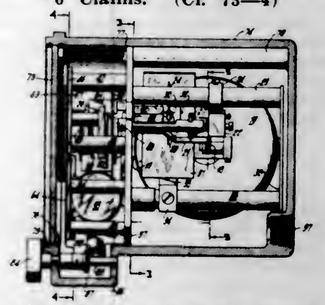
1. A meter head including a plurality of indicator wheels, drive means for turning the same in response to the running of a meter or like mechanism, the wheels being so geared as to automatically move in the ratio of 100 to 10 to 1 etc., and manually movable means affording selective adjustment of said wheels to a desired initial reading, said means including a single operating knob movable for translation and for rotation, engagement means controlled thereby for engagement with any one of the wheels, and mating engagement means on each of the wheels, whereby all of the wheels may be independently adjusted to a desired reading by the single aforesaid operating knob, said manually movable means and said meter driven means being so related that the latter does not interfere with and is not responsive to operation of the manually movable means.

2,099,464
GOGGLES
Donald L. Bruner, Coral Gables, Fla., and James H. Herr, Dayton, Ohio
Application March 26, 1935, Serial No. 13,141
4 Claims. (Cl. 2—14)



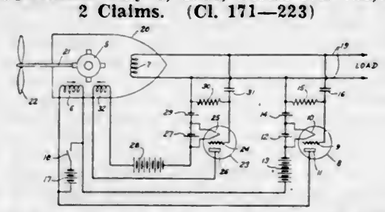
1. In a device of the class described, an eye cup frame having an outlet opening, a resilient face engaging member for said eye cup frame, an optical lens mounted in said eye cup frame means including a heating element for supplying warmed air under pressure into the space rearward of said optical lens and inlet means carried by said eye cup frame for deflecting said incoming air toward the optical axis of said lens.

2,099,465
CONDUCTOR CLAMP
Wade H. Burleson, Mansfield, Ohio, assignor to The Ohio Brass Company, Mansfield, Ohio, a corporation of New Jersey
Application July 3, 1935, Serial No. 29,682
6 Claims. (Cl. 248—74)



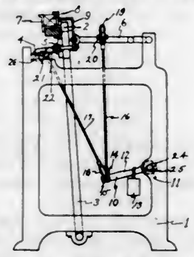
6. A supporting clamp for a conductor comprising in combination a body member arranged to be mounted in a support, an opening through the body member, a concave-convex cable-seat at one end of the body and a fulcrum at the other end thereof, an end-for-end reversible clamping member having a slotted opening therethrough, a concave seat at each said end of the clamping member to cooperate separately with the seat on the body member to grip the cable, fastening means extending through the openings and arranged to draw the members towards each other and secure the members to the support, and cooperating wedging seats on the members to guide the clamping member to move relative to the body member to grip the cable between the body seat and either one of the seats on the clamping member.

2,099,466
ALTIMETER
Victor E. Carbonara, Rockville Centre, N. Y., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application June 9, 1932, Serial No. 616,322
60 Claims. (Cl. 73—4)



17. In an altimeter having a pointer, a scale and a pressure-sensitive device for operating the pointer in accordance with changes in altitude, a rock-shaft adapted to be actuated by said pressure-sensitive device, a pointer shaft, means for setting the altimeter for a predetermined altitude, a planetary differential gear train drivably connecting said rock-shaft and pointer shaft whereby relative movement may be produced between the pointer and scale separately by the operation of said rock-shaft and said setting means, said gear train comprising a pair of planet gears in constant mesh with each other, a planet pinion carried by each of said gears and rotatable therewith, a frame on which said planet gears and pinions are journaled, an operating shaft drivably connected to and actuated by said rock-shaft and rigidly connected to said frame for rotating the latter, a pinion adapted to be operated by said setting means and in constant mesh with one of said planet pinions, a second pinion carried by the pointer shaft and in constant mesh with the other of said planet pinions, means simultaneously operable with said setting means for holding said planet frame against rotation and rendering said pressure sensitive device ineffective to actuate said rock-shaft whereby said setting means causes relative movement between the pointer and scale through said planet pinions and gears, and means for holding said setting means during indicating action whereby said rock-shaft causes the planet frame to rotate and thus drive the pointer shaft through said planet pinions and gears during indicating action.

2,099,467
ALTIMETER
Victor E. Carbonara, Rockville Centre, N. Y., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application November 5, 1932, Serial No. 641,446
6 Claims. (Cl. 73—4)



6. An altimeter comprising a pressure-responsive device responsive to changes in altitude, a fixed support for said pressure-responsive device, actuator means including a pair of plates having an arcuate bridging member therebetween spacing them apart, said plates being rotatatively mounted on said fixed support, a shaft operated by said pressure-responsive device and journaled in and between said plates and being revolvable therewith about the common axis thereof in addition to being rotatable on its own axis relative to said plates, a pair of pointers rotatably carried by said fixed support and operatively connected by said shaft to the pressure-responsive device for actuation thereby in a predetermined ratio, dial means for said pointers and having scales calibrated in the ratio of the pointers, means including a worm gear on the arcuate bridging member of the plates, a worm, and a knob adapted to be operated from the exterior of the altimeter for actuating the worm and worm gear to cause angular movement of said plates thereby revolving the shaft about the axis of said plates for operating the pointers to set the altimeter for a predetermined altitude or barometric pressure whereby said pointers indicate zero on the scales when the predetermined altitude is reached or the barometric pressure occurs, and a reference indicating device behind the dial means and viewable through an opening in the latter, said reference indicating means being operable with the pointers during setting of the altimeter and inoperable during operation of the pointers by the pressure-responsive device for indicating the predetermined altitude or barometric pressure for which the altimeter has been set.

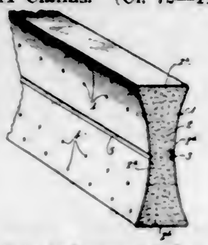
2,099,468
ELECTRICAL GENERATING AND CONTROL SYSTEM
Stephen Cerstvik, Newark, N. J., assignor to Eclipse Aviation Corporation, East Orange, N. J., a corporation of New Jersey
Application May 3, 1934, Serial No. 723,792
2 Claims. (Cl. 171—223)

1. In combination with a source of electromotive force which comprises an alternating current machine having a single output winding and two field windings, said field windings being opposed to each other, an electronic device having its input associated with said output winding and its output with one of said field windings for supplying direct current to the latter winding in proportion to the output voltage, a second electronic device having its input associated with the output winding and its output with the second field winding, and means for controlling an internal characteristic of said second electronic device so that it supplies direct current of such value to said second field winding that the combined strength of the two field windings is reduced in response to an increase in voltage in the output winding.

2,099,469
IDLE DAGGER ROD AND LIGHT SHUTTLE BOX DEVICE
James Chapman, Atlanta, and Benjaman W. Brown, Hapeville, Ga.
Application August 22, 1935, Serial No. 37,338
5 Claims. (Cl. 139—347)

1. A loom with a shuttle, a shuttle box, a binder, a binder finger, and means for stopping the loom, a protector rod and a dagger attached thereto mounted on the lay of the loom, spring means associated with said protector rod and so disposed as to hold said dagger in its upper position, an arm mounted on said protector rod, a lever pivotally mounted on the frame of the loom, rod means connecting said lever to said arm, a pitman, and rod means connecting said pitman to said lever, load means for depressing said lever and stop means associated with said lever and the frame of the loom, the combination of means being so disposed that when the shuttle of the loom is in its box that the lever, and its associated load, is supported by means of the rod connected to the arm aforementioned, the protector rod, the binder finger, the shuttle binder, and the

shuttle, but when the shuttle is not in its box and the pitman is in a raised position, the lever, and its associated load is supported by the rod connected to the pitman and the pitman, and when the pitman is in a depressed position the lever, and its associated load, is supported by the stops attached to said lever and to the frame of the loom, in all cases the protector rod and the daggers associated therewith being free of load and held against their upper stops by means of the spring aforementioned unless the lay should be forward and the shuttle out of its box in which condition the lever, and its associated load, acts through the rod and the protector arm aforementioned and causes the protector rod to rotate against the action of the protector rod spring thus throwing the daggers into engagement with the stopping means thereby stopping the loom and preventing a smash.



2,099,470

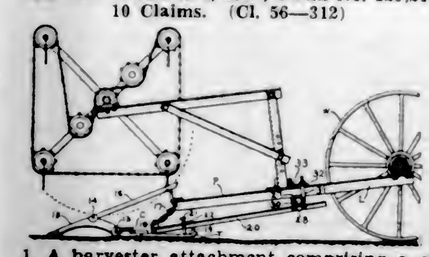
STUD

Edwin D. Coddington, Milwaukee, Wis., assignor to Reynolds Corporation, New York, N. Y., a corporation of Delaware

Application September 3, 1935, Serial No. 39,023

11 Claims. (Cl. 72—115)

1. A prefabricated composite structural member comprising a casing of light nail-penetrable sheet metal and a core of nailable cementitious material enclosed by the casing, and a longitudinally-extending inwardly-projecting lock seam uniting the two adjacent edges of the metal sheet forming the casing, said seam being disposed interiorly of the casing to provide a smooth exterior surface.



2,099,471

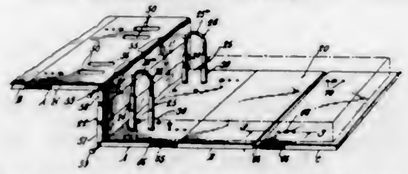
HARVESTER ATTACHMENT

Aaron D. Edgington, Cheney, Wash., assignor to Cheney Weeder Company, Cheney, Wash., a corporation of Washington

Application March 5, 1937, Serial No. 129,214

10 Claims. (Cl. 56—312)

1. A harvester attachment comprising a cutting device, push bars pivoted to said cutting device, means for limiting the pivotal movement of said cutting device, means for hingedly attaching said push bars to a harvester having a platform with said cutting device disposed below and forwardly of said platform, lifting fingers pivoted to said cutting device, gap bridging means cooperating between said platform and said lifting fingers, each gap bridging means pivoted to one of said lifting fingers and forwardly of the pivotal axis of the latter; means for limiting the pivotal movement of said lifting fingers, and means for limiting the hinge movement of said push bars.



2,099,472

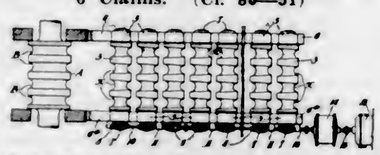
BINDER

George S. Emery, Tulsa, Okla.

Application August 24, 1935, Serial No. 37,735

5 Claims. (Cl. 129—1)

1. A loose leaf binder comprising a bottom cover composed of a plurality of transverse sections, binding posts supported upon the cover, and means uniting the transverse sections to permit separation of the sections in a direction lengthwise of the cover.



2,099,473

ROLLING MILL GUIDE

Stevenson Findlater, McKeesport, Pa., assignor to National Tube Company, a corporation of New Jersey

Application September 24, 1936, Serial No. 102,417

6 Claims. (Cl. 80—51)

1. A rolling mill guide comprising a plurality of pairs of rotatable complementary guide-forming rolls, each of said rolls having a plurality of grooves of gradually increasing diameter around its periphery, whereby a plurality of series of guide passes of variable size are formed between said rolls, and means for synchronously rotating said rolls.

2,099,474

COMPENSATING SPRING

Frederick P. Flagg, Waltham, Mass., assignor to Waltham Watch Company, Waltham, Mass., a corporation of Massachusetts

No Drawing. Application August 18, 1934, Serial No. 740,432

2 Claims. (Cl. 58—114)

2. A spring having a high elastic limit and variable modulus of elasticity at different temperatures within normal atmospheric limits of temperature, consisting of an alloy having substantially the following composition:—

	Per cent
Nickel	36
Chromium	4.5
Manganese	3
Silicon	4
Titanium	0.1
Iron	the remainder

2,099,475

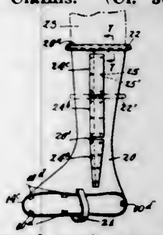
PURIFICATION OF SYNTHETICALLY PRODUCED ALCOHOLS

Johann Giesen, Helmut Hanisch, and Martin Dally, Leuna, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

No Drawing. Application September 13, 1935, Serial No. 40,412. In Germany October 10, 1934

5 Claims. (Cl. 260—156)

1. In the purification of crude anhydrous alcohols separated from the mixture of alcohols obtained by the catalytic hydrogenation of oxides of carbon the step which comprises adding to the crude alcohol an alcohol of lower boiling point and subjecting this mixture to fractional distillation.



2,099,476

WATERPROOF SPAT

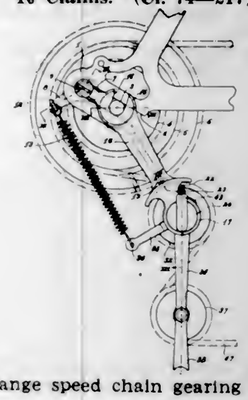
Martin Glowka, New York, N. Y.

Application April 1, 1937, Serial No. 134,251

3 Claims. (Cl. 36—2)

1. A waterproof spat comprising a tubular sheet rubber body for extending over a shoe upper and a portion of one's leg, and a strip attached across the side bottom edges of said body for extending under the arch of said shoe, and means for holding a fold longitudinally on said body for conforming said body to one's shoe and leg, comprising a plurality of strips with fastening elements along their edges cooperative with complementary fastening elements and longitudinal lines along said body and selectively removable from the top down to permit the upper portion of the body to be rolled.

2,099,477



CHANGE SPEED CHAIN GEARING FOR BICYCLES AND THE LIKE

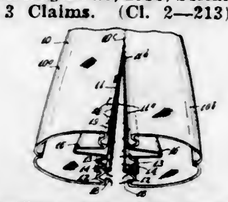
Jean Marcel Gruyer, Lyon, France, assignor to Victor Simon, Lyon, France

Application October 20, 1936, Serial No. 106,658

In France November 5, 1935

10 Claims. (Cl. 74—217)

1. A change speed chain gearing for bicycles and the like having a driving chain adapted to selectively drive a plurality of drive sprockets of different diameters, comprising a support fixed to the cycle; an axially movable chain guide pinion carried by said support and adapted to be disposed opposite each of said drive sprockets; a pivoted chain tensioning lever carried by said support and axially movable with said guide pinion; spring means tending to rotate said lever to stretch the driving chain of the cycle; and cooperating abutments on said support and on said chain tensioning lever adapted to limit the tensioning motion of said lever under the action of said spring means for each axial position of said guide pinion.



2,099,478

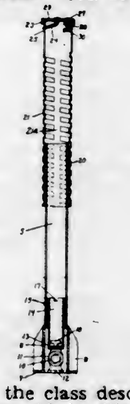
CULOTTE

William Gurian, New York, N. Y.

Application August 28, 1936, Serial No. 98,302

3 Claims. (Cl. 2—213)

1. A convertible culotte skirt, comprising material in the form of a culotte skirt having a body, wide flowing leg portions, and a crotch portion, and a fastener for securing the leg portions thereof together from the crotch to the free ends thereof, said fasteners comprising flange strips of material secured upon the leg portions and extending from the crotch to the ends of the leg portions, and engageable hooks on said strips of material, said strips of material being secured within folds formed in the leg portions, and a plurality of additional folds in the material of the leg portions extending from the crotch to the ends thereof, means for holding said folds closed as desired, including strings secured upon the material of the culotte skirt along the folds and adapted to be tied together.



2,099,479

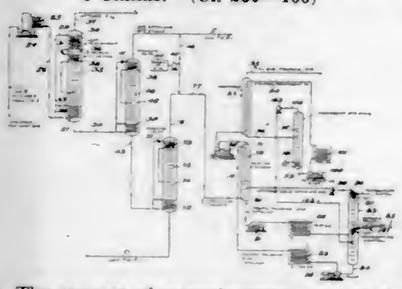
CURB BOX FOR SERVICE PIPE SHUT-OFFS IN WATER SYSTEMS

John Heinkel, St. Louis, Mo., and William J. Hebenstreit, Kansas City, Kans.

Application May 22, 1936, Serial No. 81,144

2 Claims. (Cl. 137—13)

1. A device of the class described, comprising a tubular box, provided with a housing in its



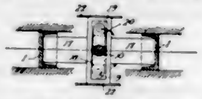
lower end, and having a screw thread at its upper end, a corrugated barrel engageable with said thread, a valve casing in said housing, and valve therein, a sleeve in the lower part of said box, spaced therefrom, and provided with openings in its sides, cooperating means on said sleeve and valve casing for holding said sleeve removably in position, a handle connected with said valve and extending into said sleeve, and means for removing said sleeve from the box.

2,099,480

PROCESS OF MANUFACTURING PROPYL CHLORIDE

Eric B. Hjerpe, Pittsburgh, and William A. Gruse, Wilkinsburg, Pa., assignors, by mesne assignments, to Gulf Oil Corporation, a corporation of Pennsylvania

Application May 26, 1932, Serial No. 613,774
6 Claims. (Cl. 260—166)



5. The process of manufacturing propyl chloride from propylene, which comprises contacting propylene and hydrogen chloride in the presence of a catalyst consisting of stannic chloride.

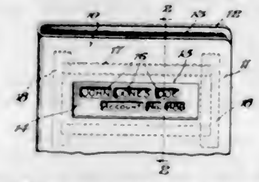
2,099,481

RECIPROCATING ENGINE OR PUMP

William Aubrey Hildyard, Brunswick, Australia, assignor to Strate-Stroke Pumps and Engines Proprietary Limited, Footscray, Victoria, Australia, a company of Australia

Application March 26, 1936, Serial No. 71,014
In Australia April 4, 1935
1 Claim. (Cl. 74—50)

A reciprocating engine or pump comprising a piston slidable in a cylinder, a crosshead slidable between guides and having a slotway in each of its opposite faces, a connecting rod rigidly connecting the piston and crosshead to form a combined structure which reciprocates as a unit, two axially aligned crankshafts arranged one on each side of the crosshead and adapted to rotate in opposite directions, crank arms on said crankshafts, and crank-pins on said arms each operating in one of the opposite slotways of the crosshead.



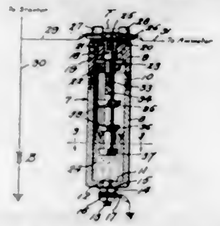
2,099,482

PASS BOOK

Hughes Hal Hill, Augusta, Ga.

Application October 9, 1936, Serial No. 104,891
3 Claims. (Cl. 101—287)

1. A pass book containing pages for entering items relating to an individual account comprising front and back covers, one of said covers being formed to receive a printing plate bearing



raised identification characters corresponding to said account, said cover also carrying inking means for the printing characters.

2,099,483

AUTOMATIC CIRCUIT BREAKER

Marion Kelly Hinde, Atlanta, Ga.

Application September 16, 1936, Serial No. 101,144
6 Claims. (Cl. 200—52)

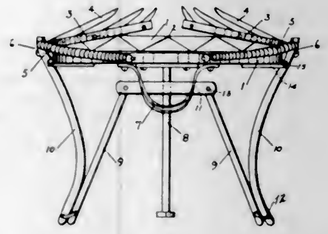
1. A circuit breaker comprising a cylindrical casing adapted to be mounted on an automobile in normally vertical position, said casing including a lower conducting part adapted to be grounded to the automobile, and an upper insulating part detachably connected to the lower part and forming an insulated support for fuse clips, fuse clips secured to said upper part, a conducting member extending through said upper part and electrically connected to one of said clips, and a conducting liquid partly filling the lower part while the latter is in vertical position and adapted to close the circuit between said lower part and said conducting member when the casing is moved from vertical to horizontal position.

2,099,484

TOILET APPLIANCE

Lynde De F. Hokerk, Utica, N. Y., assignor to Kerk Guild, Inc., Whitesboro, N. Y., a corporation of New York

Application November 9, 1935, Serial No. 49,102
3 Claims. (Cl. 87—23)



1. A toilet article for personal use in bathing consisting of a body of soap having a horizontal opening extending through it from one side to the other, and a substantially endless flexible suspension member forming an elongated loop of sufficient size to pass over the head of a person, the suspension member having a portion passing through the opening in said body and the side portions of the loop being spaced from each other from the sides of the body to the top of the loop when the toilet article is in use thereby completely exposing the body of soap for use without the suspension member interfering with the free use of the soap.

2,099,485

GOBLET FOOT FORMING DEVICE

Stephen Hujo, Jr., Clarksburg, W. Va.

Application November 4, 1935, Serial No. 48,120
3 Claims. (Cl. 49—26)

1. A device for shaping the foot of a glass goblet or the like while hot, including a base having radial ribs separated by radial grooves, a stem extending from the base, a member slidable on the stem, opposed levers pivotally connected to the base, fingers on said levers movable into position within the grooves in the base, connections between the levers and the slidable member, and resilient means for automatically shifting said slidable member in one direction along the stem and moving the fingers and levers relative to the base.

2,099,486

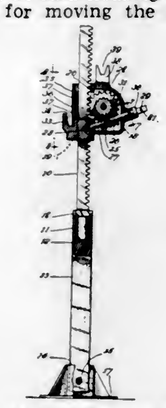
SYNTHETIC RESIN AND METHOD OF PRODUCING

Irvin W. Humphrey, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application January 29, 1935, Serial No. 3,945
18 Claims. (Cl. 260—8)

1. A reaction product of dipentene-maleic anhydride and an alcohol.

9. A coating composition comprising a reaction product of an alcohol and dipentene-maleic anhydride, and a solvent.



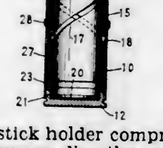
2,099,487

AUTOMOBILE JACK

Carl W. Johnson, Glencoe, and Gilbert M. Smith, Congress Park, Ill.; said Smith assignor to said Johnson

Application March 25, 1935, Serial No. 12,766
3 Claims. (Cl. 254—97)

3. A jack comprising a base, an intermediate supporting member pivotally mounted thereon for rotation in one plane only, and a rack-bar mounted on the upper end of said intermediate supporting member in alignment therewith and for rotation thereon about its longitudinal axis, a housing slidably mounted on said rack-bar, operating means in said housing cooperating with the rack-bar for moving the housing up and



down thereon, and means carried by said housing for engaging an article to be raised.

2,099,488

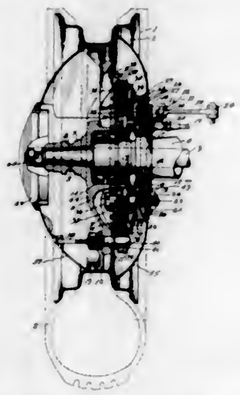
LIPSTICK HOLDER

Nathan Kasdan, New York, and Richard F. Landwehr, Laurelton, Long Island, N. Y., assignors to Majestic Metal Specialties, Inc., New York, N. Y., a corporation of New York

Application October 20, 1934, Serial No. 749,136
16 Claims. (Cl. 206—56)

1. A cosmetic stick holder comprising a carrier, a pair of sleeves surrounding the carrier and capable of relative rotation therebetween, a pin projecting from the carrier into cooperation with said sleeves, said sleeves being provided with oppositely inclined helical guide means for the carrier pin, said guide means being at such inclination as to hold the carrier against downward movement under an axial thrust, each of said sleeves being longitudinally slit and neither guide means crossing the slit in its sleeve.

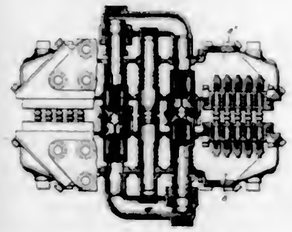
2,099,489



POWER TRANSMISSION

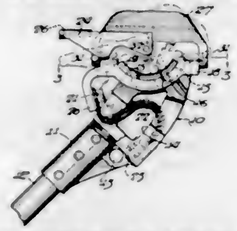
Homer T. Lambert, St. Joseph, Mich.

Application February 24, 1936, Serial No. 65,459
12 Claims. (Cl. 188—72)



1. In a brake mechanism of the class described, a support, a unitary brake assembly constructed to be readily attached to and detached from its operative position as a unit and comprising a stationary part, a brake member adjacent said stationary part movable rotatably and laterally relatively thereto, means interposed between said brake member and stationary part for imparting lateral thrust to said brake member incident to

rotary movement of the latter, and means connecting said stationary part and brake member together and to the support, with the thrust means disposed between the stationary part and



brake member whereby to provide a brake assembly of unitary form which may be mounted and dismounted with the elements thereof in their assembled relation aforesaid.

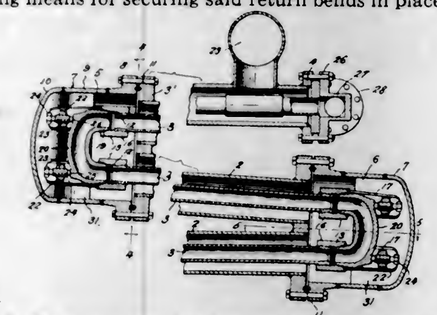
2,099,490
COUPLING MECHANISM
Ernst A. Larsson, Mansfield, Ohio, assignor to The Ohio Brass Company, Mansfield, Ohio, a corporation of New Jersey
Application April 8, 1936, Serial No. 73,331
7 Claims. (Cl. 284—6)

3. A fluid pressure connecting device for fluid pressure lines on coupled cars comprising, a support, tubular reciprocating means mounted on the support and a spring yieldingly holding the means in its advanced position, the reciprocating means having a lateral movement relative to the support, a manifold for cross-connecting the reciprocating means with other tubular means mounted on the support, means to prevent rotation of the tubular means without preventing its reciprocation and lateral movements, a packed joint between one end of the tubular means and the manifold, a renewable gasket at the front end of the tubular means and a check valve in the said means normally held closed by a spring, the gasket arranged to be engaged by the check valve when closed and by the fluid pressure connecting means on a cooperating fluid pressure connecting device to connect the fluid pressure lines on coupled cars and to open the check valves in both connecting means and means for connecting a fluid pressure line to the manifold.

2,099,491
RENEWABLE AND SELF-LUBRICATING TROLLEY SHOE
Henry A. Leonhauser, Baltimore, Md., assignor, by direct and mesne assignments, to The Ohio Brass Company, Mansfield, Ohio, a corporation of New Jersey
Application July 24, 1933, Serial No. 681,977
3 Claims. (Cl. 191—59.1)

1. A current collector for electric railway cars, comprising a trolley head including a relatively fixed portion, a relatively movable portion pivoted upon said fixed portion for limited rocking movement forwardly and rearwardly with respect thereto, a shoe mounted on the top of said relatively movable portion and grooved for engagement with a trolley wire, said shoe being formed at its ends with parallel apertured depending lugs engaging against the front and rear ends of said movable portion, and axially alined securing elements passing through said lugs and into said relatively movable portion, said shoe being formed of a metallic alloy containing a lubricating ingredient.

2,099,492
BOAT
Alfred E. Luders, Stamford, Conn.
Application May 9, 1935, Serial No. 20,585
10 Claims. (Cl. 114—66.5)



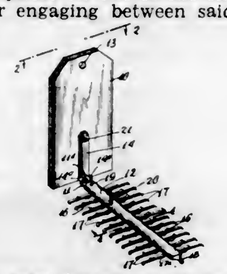
1. In a boat of the sled type, having a propeller disposed aft of the hull with its axis substantially at normal water line at high speed, a plate disposed rearwardly from the hull adapted to contact with the water in the wake of the boat, a rudder disposed beneath the plate aft of the propeller, and an opening in the plate normally embracing the propeller.

2,099,493
DOUBLE PIPE HEAT EXCHANGER
John C. Mahoney, Westfield, N. J., assignor to Henry Vogt Machine Co. Inc., Louisville, Ky., a corporation of Kentucky
Application June 16, 1936, Serial No. 85,614
2 Claims. (Cl. 257—247)

1. A heat exchanger comprising a plurality of double pipe elements arranged in rows, each including an inner tube and a surrounding outer tube, said tubes being arranged to define an annular space between them, the ends of outer tubes at one end of said exchanger being supported by a tube sheet and opening in the outer face of said tube sheet, a header secured against said tube sheet defining therewith a chamber with which two or more adjacent pair of outer tubes communicate, means for connecting the inner tubes of each of said pairs at said end of said exchanger

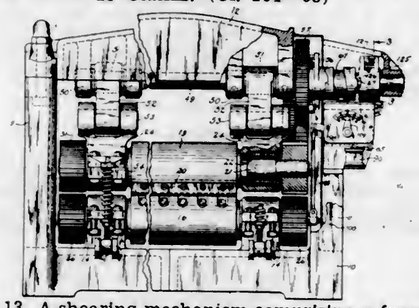
comprising coupling members fixed to said inner tubes and of such size as to permit said inner tubes to be withdrawn through said outer tubes, a return bend for the inner tubes of each of said pairs having its ends received by said coupling members, said coupling members including clamping means for securing said return bends in place,

a baffle within said header between adjacent return bends for preventing lateral circulation of the liquid within said header and means for independently serially connecting the inner tubes of said rows and the outer tubes of said rows at the opposite end of said exchanger.



2,099,494
OVERHEAD TROLLEY SYSTEM
Samuel S. Matthes, Mansfield, Ohio, assignor to The Ohio Brass Company, Mansfield, Ohio, a corporation of New Jersey
Application February 12, 1936, Serial No. 63,570
2 Claims. (Cl. 191—38)

1. An overhead trolley device for use in a two wire trolley system comprising a pair of spaced frogs having U shaped receiving ends, each end having spaced upstanding lugs with transverse registering openings to receive through fastening means, a crossover spaced from the frogs and having U shaped receiving ends each with upstanding spaced lugs with registering transverse openings to receive through fastening means, conducting means connecting one crossover end with a branch end of one frog and insulating means connecting another end of the crossover to a main end of the other frog, each connecting means having its ends provided with a single projecting lug positioned between the lugs of the end to which it is attached and having transverse openings registering with the openings of the upstanding lugs, through means positioned in the openings to secure the parts together, the connecting means also having the vertical height thereof when installed greater than the width to permit bending in a horizontal direction but rigid in a vertical direction and the lower edge of the connecting means guiding a current collector off and onto the frogs and the crossover.

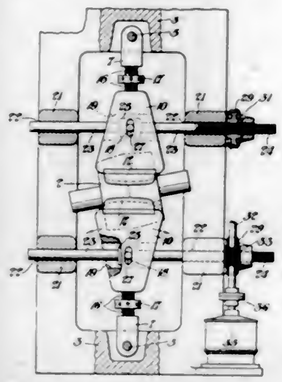


2,099,495
FOLDING NECKTIE HOLDER
Louis I. Mirel, Brooklyn, N. Y.
Application August 1, 1935, Serial No. 34,137
4 Claims. (Cl. 211—97)

1. A foldable tie holding rack, comprising a wall bracket, a fork element on said wall bracket, having recesses on the inner adjacent sides of the fingers, forming said fork element, a tie holding bar, a sphere on one of the ends of said tie holding bar engaging between said fingers and

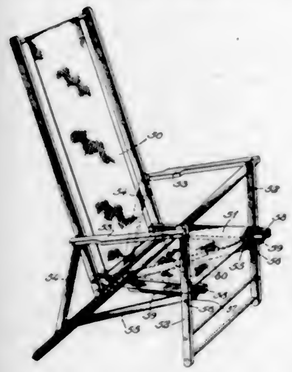
into said recesses for universally supporting said tie holding bar on said wall bracket, and means for holding said sphere and tie holding bar in all of their adjusted positions on said wall bracket.

2,099,496
SHEARS
Myles Morgan, Worcester, and John N. Whalen, Boylston, Mass., assignors to Morgan Construction Company, Worcester, Mass., a corporation of Massachusetts
Application February 7, 1936, Serial No. 62,762
13 Claims. (Cl. 164—68)



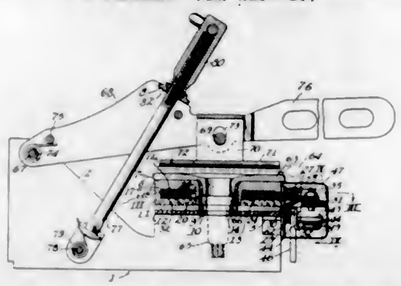
13. A shearing mechanism comprising a frame, a member supported for movement in the frame, a cutter head rotatably mounted in the member, means including an eccentric rotatably mounted in the frame to impart movement to the member and thereby move the cutter head, means to rotate the cutter head continuously, means including a clutch to rotate the eccentric, means responsive to the approach of stock to the shearing mechanism and effective to produce clutch engagement and thus cause the cutter head to move and cut a short piece from the front end of the stock, and means to disengage and engage the clutch in timed relation with the rotation of the cutter head while stock is passing through the shearing mechanism and thereby shear predetermined lengths from the remainder of the stock.

2,099,497
GUIDE FOR TUBE ROLLING MILLS
John W. Offutt, Ellwood City, Pa., assignor to National Tube Company, a corporation of New Jersey
Application May 20, 1936, Serial No. 80,876
4 Claims. (Cl. 80—13)



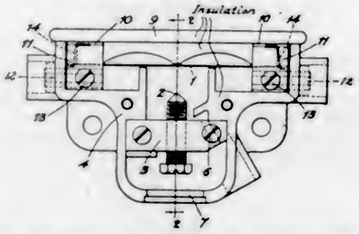
1. Apparatus for forming metallic tubular blanks comprising, in combination, a plurality

of metal-working rolls which are constructed and arranged to helically advance a work-piece in a continuous manner, at least one guide member disposed to present its guiding surface to that portion of the work-piece which is in the pass of said metal-working rolls, said guide member having its guiding surface longitudinally



arced and being capable of only limited swinging movement in a plane through the axis of the work-piece to present different longitudinal portions of its guiding surface thereto, and means for imparting swinging movement to said guide member whereby excessive localized heating and wearing of said guiding surface is substantially reduced.

2,099,498
FOLDING CHAIR
Orval R. Platter, North Vernon, Ind., assignor to North Vernon Industries, Inc., North Vernon, Ind., a corporation of Indiana
Application February 12, 1935, Serial No. 6,251
7 Claims. (Cl. 155—117)

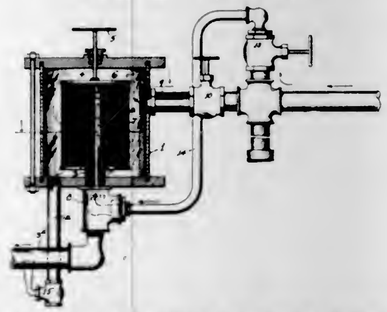


3. A chair comprising side frames connected by cross bars, a back pivotally supported between said side frames, a seat pivotally supported by the back and slidable on one of said cross bars, said seat comprising side bars and a flexible strip of material extending over the sides thereof, clamping strips securing said flexible material on the under sides of the seat side bars and said strips slidingly engaging said supporting cross bar, and stop pins on the seat for limiting the movement of the seat with respect to the frames.

2,099,499
ELECTRIC VULCANIZER
Estel C. Raney, Columbus, Ohio, assignor to Ranco Incorporated, a corporation of Ohio
Application September 13, 1935, Serial No. 40,466
7 Claims. (Cl. 219—19)

1. In an electric vulcanizer, a shell having a relatively thick vulcanizing wall and a recess therein, a heating element for heating said wall and positioned adjacent to said wall, a switch for controlling the flow of current through said heating element and positioned exteriorly of the shell, a thermostatic element located in said recess so that said thermostatic element is substantially between the heating element and said wall, and a member of heat insulating material interposed between said heating element and said wall.

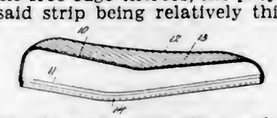
2,099,500
SAFETY FUSE
Edward Albert Sanders, Bath, England
Application February 24, 1936, Serial No. 65,517
In Great Britain May 15, 1935
2 Claims. (Cl. 200—117)



1. A protective device for a transformer having a primary circuit and a secondary circuit, said device comprising a casing of insulating material open at one side, a pair of spaced apart spring contact clips fastened within said casing for connection in the secondary circuit of the transformer, a removable cover for the open side of said casing, a rib extending inwardly from said cover, spaced contacts carried by said rib and cooperating with the spring contacts within the casing to hold the cover normally closed, a pair of spring arms carried by said rib, a fusible element extending between said spring arms and maintained tensioned and in contact with said rib carried contacts by said arms, and an electrode mounted within said casing in spaced relationship to said fusible element and for connection with the primary circuit of the transformer.

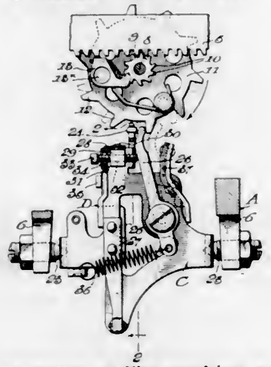
2,099,501
NITROCELLULOSE EMULSIONS AND METHOD OF PRODUCING
John K. Speicher, Newark, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application April 4, 1935, Serial No. 14,637
16 Claims. (Cl. 134—79)

1. The method of modifying a nitrocellulose emulsion comprising a substantially water-immiscible nitrocellulose solution emulsified as the disperse phase in an aqueous solution of an emulsifying agent, so as to enable it to dry to a clear film under conditions of high humidity, which includes adding to the said emulsion a substantially water-immiscible volatile organic liquid substantially free of non-volatile matter and characterized by having a boiling point higher than that of the lowest boiling solvent in the emulsified nitrocellulose solution, and emulsifying said added liquid in the emulsion as a second disperse phase.



2,099,502
CLEANING DEVICE FOR STRAINERS
Harry C. Stockdale, Ravenna, Ohio, assignor to Food Machinery Corporation, San Jose, Calif., a corporation of Delaware
Application May 29, 1933, Serial No. 673,504
Renewed May 15, 1935
12 Claims. (Cl. 210—167)

1. A straining device for arresting the movement of spray residue along a flowing stream of spray material comprising a housing, a pipe line for directing a stream of spray material into said housing, a closed screen member within said housing, a pipe constituting an overflow outlet for screen spray material, the overflow outlet being located wholly within said closed screening member and above the bottom thereof, a by-pass pipe line between said inlet pipe and said overflow outlet for reversing the flow of spray material through said screening member for cleaning accumulated residue therefrom, the inlet end of said by-pass pipe line entering said screening member through said overflow outlet.

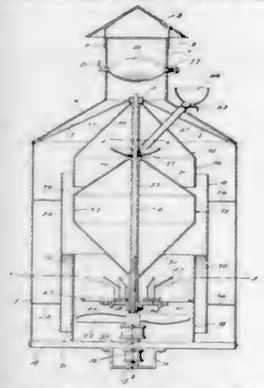


2,099,503
SADDLE AND METHOD OF MAKING THE SAME
Earl W. Swett, Alma, Mich., assignor to The Lobdell-Emery Manufacturing Company, Alma, Mich., a corporation of Michigan
Application April 30, 1936, Serial No. 77,282
1 Claim. (Cl. 155—5.23)

A saddle for cycles comprising a seating member fabricated of relatively thick metal and having the stiffness and strength necessary to support the weight of a rider, a strip of metal secured to the said seating member and projecting beyond the free edge thereof, the projecting portion of said strip being relatively thin as com-

pared with the seating member, and a covering of leather or the like extending over the seating member and having its edge stitched to said projecting portion of the strip.

2,099,504
TYPEWRITING MACHINE
Anthony Utz, Hartford, Conn., assignor to Royal Typewriter Company, Inc., New York, N. Y., a corporation of New York
Original application May 1, 1936, Serial No. 77,420. Divided and this application August 27, 1936, Serial No. 98,233
3 Claims. (Cl. 197—88)



1. In a typewriter or like machine, an escapement mechanism including an escapement wheel, a dog rocker, a fixed dog and a movable dog mounted on the rocker and alternately movable into engagement with the teeth of the wheel, a flexible stop arm for the movable dog mounted on the rocker, and an adjustable stop mounted on said arm for direct contact with said movable dog.

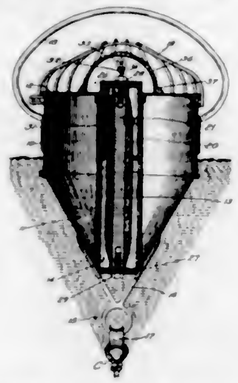
2,099,505
SEED SEPARATOR
Morris Weaver, Fredericksburg, Pa.
Application June 16, 1937, Serial No. 148,583
2 Claims. (Cl. 209—139)

1. A pneumatic seed separator comprising a cylindrical upstanding casing open at its lower end and having a conical upper neck terminating in an open flue member, a bar extending diametrically across the lower end of said casing, an upstanding cylindrical structure in said casing supported on said bar axially of said casing and terminating short of the neck thereof, said structure comprising a lower open-ended section forming a vertical air tunnel, and a relatively larger concentric upper section forming a separator chamber above the air tunnel open at its upper end, said structure also including a pair of tapered seed discharge chutes extending from the bottom of the upper section upon opposite sides of the lower section, respectively, a cylindrical deflector mounted in said upper section of the same diameter as said lower section and supported above the latter concentrically thereof, said member having oppositely coned ends, the lower end extending partially into said lower section to deflect air

therefrom obliquely and upwardly against the inner wall of the upper section, and the upper end of said member forming a spreader for deflecting seed deposited thereon against the side wall of the upper section outwardly and downwardly, a concave circular seed distributor rotatably mounted adjacent to the upper end of said deflector member for ejecting seed deposited therein upwardly and outwardly under the action of centrifugal force, a cylindrical baffle member mounted in said casing concentrically thereof above said deflector member and having a lower skirt depending into

said upper section adjacent the said upper end of the deflector to form a narrow discharge opening around the edge of said end for the passage of seed from said end into the upper section, said baffle member having an upper conical end for deflecting seed ejected from said distributor downwardly and outwardly, a gravity feed device for depositing seed in said distributor, means for rotating the distributor comprising a rotatably mounted shaft extending upwardly through said cylindrical structure and deflector member axially thereof, and a blower fan rotatably mounted in the lower end of said air tunnel.

2,099,506



ILLUMINATED BUOY FOR MARINE SERVICE

Gunnar A. F. Winckler, Worcester, Mass., assignor to Winckler Engineering Laboratories Incorporated, Boston, Mass., a corporation of Massachusetts

Application May 13, 1933, Serial No. 670,903

1 Claim. (Cl. 9—83)

A buoy for marine service comprising in combination an outer casing, a hollow conical end portion at the bottom of said outer casing with its apex extending downwardly, a cylindrical wall within said outer casing and concentric therewith, whereby a cylindrical chamber is formed about the vertical axis of said buoy, said chamber having insulated bars across its lower end, a sea water generator link unit located in said chamber and dimensioned to fit snugly therein, said generator unit being comprised of negative and positive electrodes, normally inoperable, nut and bolt means associated with said insulated bars for retaining said generator in place, a lamp permanently secured to the top of said generator unit and connected to the respective electrodes of said generator unit, a lens on said buoy extending over said lamp, immersion of said buoy in sea water causing the influx of water in the said chamber around the bars at the bottom of said chamber, whereby said water serves as an electrolytic link to activate said generator and energize said lamp, withdrawal of said buoy from the water causing the egress of water from said cham-

ber and consequent cessation of the action of said generator unit and deenergization of the lamp.

2,099,507

NECKTIE RACK

Jack Wright, Cleveland, Ohio, assignor of one-half to Allan M. McDarment, Cleveland, Ohio

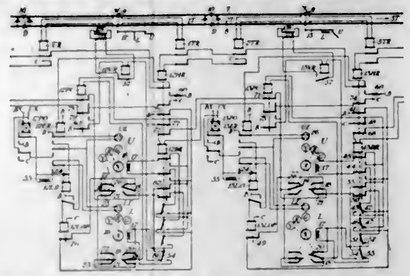
Application July 24, 1936, Serial No. 92,437

2 Claims. (Cl. 211—106)

1. A necktie rack consisting of a piece of stiff wire or the like bent to provide a horizontal hanger member having upwardly directed bends at regular intervals and straight hanger portions between said upwardly directed bends, the ends of said piece of material having vertical portions extending upwardly from the end straight hanger portions in the plane of said upwardly directed bends and horizontal portions extending rearwardly from the upper ends of said vertical portions, and the horizontal rearwardly extending portions of said ends terminating at their rear ends in upwardly directed eyes adapted to receive screws or like fastenings for securing the rack to a vertical wall or like support, said upwardly directed bends being of elongated form to provide relatively deep hanger spaces between adjacent ones of said upwardly directed bends each adapted to receive a large number of superimposed ties.

2,099,508

RAILWAY SIGNALING SYSTEM



Henry S. Young, Wilkinsburg, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania

Application July 28, 1936, Serial No. 93,030

19 Claims. (Cl. 246—46)

1. In combination, a forward section and a rear section of railway track, a signal for the forward section controlled by traffic conditions in advance and including a pair of lamps, means effective when the rear section is occupied to light both said lamps to cause said signal to display an indication, a signal for the rear section, and means effective if the filament of either lamp is broken when both sections are unoccupied to

cause the signal for the rear section to assume a condition for displaying a more restrictive indi-

cation than such signal would be in condition for if the filaments were intact.

2,099,509

STEEL ALLOY

Edgar F. Blessing, East Orange, N. J.

No Drawing. Application November 23, 1935, Serial No. 51,224

13 Claims. (Cl. 75—126)

5. A forgeable steel characterized by being stable against demolybdenization and decarburization at its hot working temperature and by being capable of complete hardening when quenched from a temperature of 1950 to 2050° F. comprising as its principal alloying ingredients approximately 8–13% molybdenum, more than 10 but not more than 17% chromium, 0.50 to 1.25% carbon and an effective amount up to 5% of metal selected from the group consisting of vanadium, tantalum and columbium, the major portion of the remainder being iron.

2,099,510

CONDENSATION PRODUCT OF PHENOLPHTHALEIN

Edmond H. Bucy and Robert Watkins, Waukegan, Ill., assignors to Atlas Powder Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application April 2, 1936, Serial No. 72,289

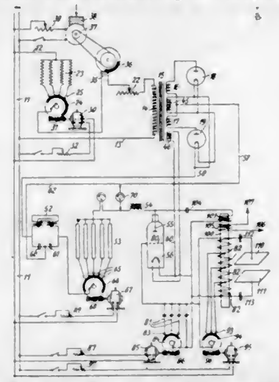
12 Claims. (Cl. 260—2)

1. A synthetic resin consisting of the condensation product of phenol-phthalein, rosin, and a non-essential vegetable oil, said product having a melting point in the neighborhood of 85° to 90° C.

6. The process of making an amorphous condensation product of phenol-phthalein and rosin which comprises heating a mixture of phenolphthalein and rosin to a temperature in the neighborhood of 480° F., cooling the mixture to a temperature in the neighborhood of 420° F., and maintaining the temperature in the neighborhood of 420° F. until the reaction mass has become entirely clear.

2,099,511

OSCILLATOR FOR THE BIOLOGICAL TREATMENT OF LIVING TISSUE



Viktor Caesar, Stuttgart, Germany

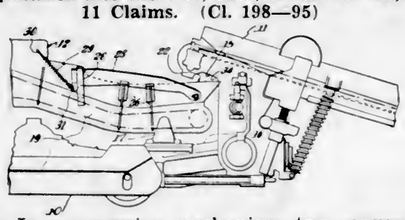
Application January 9, 1934, Serial No. 705,951

In Germany March 16, 1933

4 Claims. (Cl. 128—408)

1. In a device for biological treatment of the ultra structure of living tissue, two terminal members, one of said members being connectible to a ground and the other member being connectible to the tissue to be treated, a tube transmitter connected across said members for producing electrical oscillations, and means for feeding electrical energy to said tube transmitter; said means comprising a rectifier, a primary circuit for feeding current to said rectifier, a secondary circuit for conducting a continuous cur-

rent from the rectifier to said transmitter tube, means in said primary circuit for periodically opening and closing said primary circuit, and revolving circuit-breaking means in said secondary circuit for varying the characteristics of said oscillations.



2,099,512

CONVEYER

Frank Cartlidge, Chicago, Ill., assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois

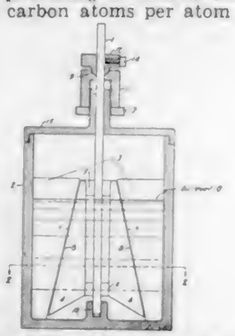
Application December 17, 1936, Serial No. 116,279

11 Claims. (Cl. 198—95)

1. In a conveying mechanism, two conveyers having their adjacent ends in cascade relationship, the receiving conveyer having upwardly extending walls forming a hopper, the discharge conveyer being mounted for lateral pivotal movement toward opposite sides of said hopper, and extensions extending along the sides of said hopper walls depressible by engagement with the discharge conveyer when the latter is swung to one side or the other of said hopper.

2,099,513

HYDROCARBON OIL MANUFACTURE



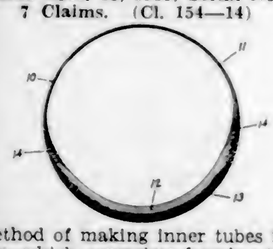
Martin de Simó and Frederick B. Hilmer, Berkeley, Calif., assignors to Shell Development Company, San Francisco, Calif., a corporation of Delaware

Application September 3, 1935, Serial No. 38,991

6 Claims. (Cl. 196—13)

1. In the process of fractionally separating a mixture of non-fluid hydrocarbon polymers of different molecular weights ranging from below 1,500 to above 150,000 of the type produced by polymerizing unsaturated hydrocarbons capable of forming polymeric homologous series by means

of a polymerization catalyst of the type of boron fluoride to produce polymer fractions of relatively uniform molecular weight, the steps of dissolving said mixture in a quantity of a non-selective solvent to form a solution, subjecting said solution to repeated treatments with a series of selective oxy-hydrocarbon solvents of progressively higher oxygen content possessing 20 or less carbon atoms and 2 to 10 carbon atoms per atom of oxygen,



said series consisting of compounds of a single chemical class selected from the group consisting of alcohols, ketones, ethers, esters, mono-carboxy acids and phenols, each treatment being carried out under conditions to effect precipitation of polymers of relatively high molecular weights from the said solution and separating the precipitate from the solution remaining after each treatment.

2,099,514

PUNCTURE-SEALING INNER TUBE FOR PNEUMATIC TIRES

Boyd C. Eberhard, Akron, Ohio, assignor to Wingfoot Corporation, Wilmington, Del., a corporation of Delaware

Application April 13, 1935, Serial No. 16,193
7 Claims. (Cl. 154—14)

1. A method of making inner tubes for pneumatic tires, which comprises forming tube stock having a rim-adjacent portion of vulcanizable rubber and a tread-adjacent portion of plastic material formed integrally therewith, severing a section of predetermined length from said tube stock, applying an outer tread portion of vulcanizable rubber to the tread-adjacent portion of said section, connecting the ends of said section to form an endless tube, and permanently uniting said portions and said ends to form an integral structure, said plastic material forming an inner lining for said tube adapted to flow into and seal punctures developing in said outer tread portion.

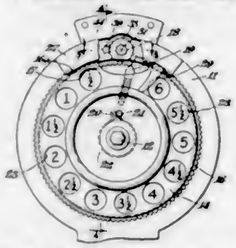
2,099,515

WATCHCASE

Harold N. Grey, New York, N. Y.

Application April 21, 1936, Serial No. 75,520
7 Claims. (Cl. 58—88)

7. In combination, a wrist watch having an outwardly extending winding crown, a supplementary watch casing therefor for transforming the same into a pocket style watch comprising a frame having an opening therein, said wrist watch having its sides enclosed by said frame



with its winding crown disposed in said opening so as to be accessible for manual operation and means for securing said wrist watch in position within said frame.

2,099,516

TIMING AND SIGNALING DEVICE

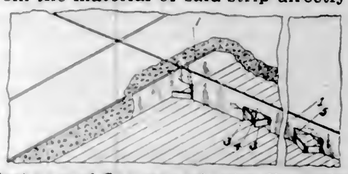
Harry Hackett, New York, N. Y.

Application August 27, 1936, Serial No. 98,152
7 Claims. (Cl. 161—23)

1. In timing mechanism, in combination, an indicating dial of vibratile material, means supporting said dial for movement from a position of rest to a predetermined position and return therefrom to its position of rest, resilient means opposing said first movement and furnishing power for said return movement, an escapement mechanism controlling said dial during the major portion of its return movement, a resiliently-held clapper, and a series of teeth formed integral with said dial and adapted as said dial nears the end of its return movement successively to engage said clapper whereby said dial is vibrated to produce an audible signal.

4. In timing mechanism, in combination, a dial having finger holes showing time-measuring indicia, a pivotal mounting therefor, a finger stop mounted in spaced relation to the finger holes in said dial and adapted to limit rotation thereof to a predetermined extent, a pinion, an escapement mechanism associated with said pinion, a set of teeth arranged and adapted to engage said pinion after predetermined rotation of said dial in one direction, and a second set of teeth formed integral with said dial and adapted during a part of the rotation thereof to strike against means secured to a stationary part of the mechanism whereby an audible signal is produced.

2,099,517



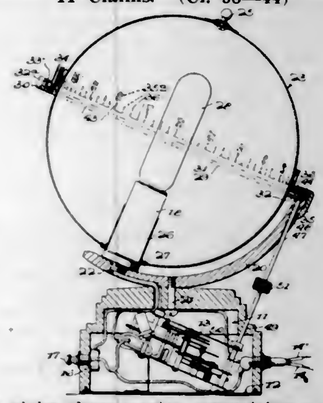
FLOOR CONSTRUCTION

Orril H. Hayes, Damariscotta, Maine

Application January 10, 1936, Serial No. 58,593
13 Claims. (Cl. 94—17)

1. A dividing strip for sectional plastic floor construction comprising a strip of flexible metal having an unbroken upper edge, a plurality of flanges struck out from the material of the strip

at its lower edge and extending laterally, obliquely in one direction and a plurality of flanges struck out from the material of said strip directly above



said first named flanges and extending outwardly, obliquely in an opposite direction, the distance separating the edge of said flanges being equal to the thickness of the strip.

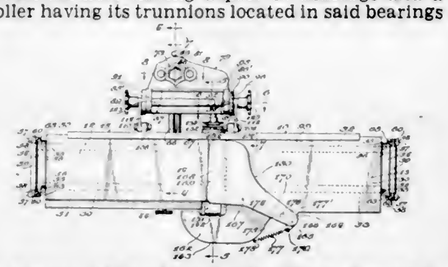
2,099,518

GLOBE CHRONOMETER

George W. Hazlett, Muscatine, Iowa, assignor of one-half to Doctor W. W. Daut, Muscatine, Iowa

Application April 28, 1937, Serial No. 139,603
11 Claims. (Cl. 58—44)

6. A globe chronometer comprising a support, a base, an inclined socket carried by the support to receive an electric bulb, a light transmitting globe removably mounted upon the socket, a race band secured to the support and having its plane arranged substantially at a right angle to the longitudinal axis of the socket, a ring gear mounted upon the race band and having means to indicate the time, a pointer carried by the race band, driving means carried by the base, and driving connecting means between the driving means and the ring gear and arranged exteriorly of the globe.



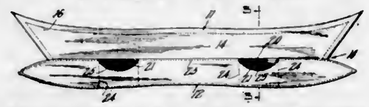
2,099,519

WOODWORKING TOOL

Theron L. Hedgpeth, Oak Park, Ill., assignor to Duro Metal Products Company, Chicago, Ill., a corporation of Illinois

Application March 5, 1936, Serial No. 67,221
6 Claims. (Cl. 144—129)

1. In a wood working tool, the combination with a table section movably mounted on said base, a cutter carried by said base, said table having bores located in parts of said table extending parallel to the table top, a pair of rods, each rod being mounted in a bore in said table section, the two adjacent ends of said rods being joined by a transverse frame member located outside said table whereby said transverse frame member may be located at a point spaced from said table and supported from said table by said rods to provide an extension of said table, said transverse frame member having a pair of bearings and a roller having its trunnions located in said bearings



to support the work, said roller being secured in place in said bearings by the over-hanging heads of threaded members threaded into said transverse frame member.

2,099,520

COLLAR AND THE LIKE

Clara F. Hendrycy, New York, N. Y.

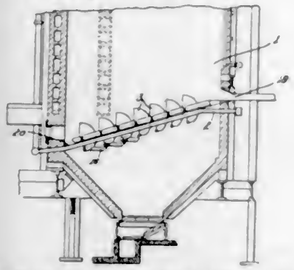
Application January 23, 1936, Serial No. 60,363
4 Claims. (Cl. 2—131)

1. An improvement in collars and the like comprising an article of manufacture having a ply of material of which one edge is folded to form a hem, the combination of a stiffener substantially the width of the hemmed ply so as to extend from edge to edge thereof with a part juxtaposed to said hem, said stiffener being slit inwardly at an end thereof and at a distance from the edge next the fold of the hem substantially the depth of the hem, a portion of the stiffener beyond the part thereof juxtaposed with respect to the hem being doubled on a fold line normal to the slit and hem so as to avoid an increase of thickness of the hem by the doubled portion of the stiffener.

2,099,521

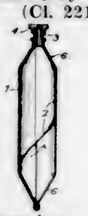
BASEBALL BAT

Harold W. Herkimer and Harlan E. Holcomb, Niagara Falls, N. Y.



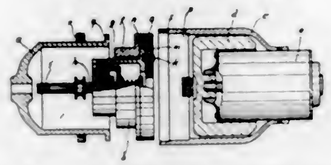
Application July 17, 1936, Serial No. 91,125
8 Claims. (Cl. 273—72)

1. A baseball bat, comprising a rigid core enclosed by a conformable envelope of sponge rubber firmly united therewith and providing a soft



pliable ball engaging portion and a compressible cushioning hand grip, the envelope having a longitudinal slit provided adjacent one end portion for introduction of the core thereinto.

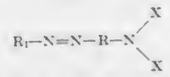
2,099,522
REFUSE BURNING FURNACE
Maurice A. Hofft, Indianapolis, Ind.
Application February 8, 1936, Serial No. 62,887
3 Claims. (Cl. 122—376)



1. In a furnace, in combination, a plurality of water tubes extending longitudinally of the furnace from front to back, a plurality of grate bars, each having comparatively deep vertical side walls having notches in their upper edges to receive pusher finger trunnions and connected on their top faces by a series of cross bars and having on their inner walls transversely extending fingers, said grate bars occupying the space between said tubes and pusher fingers mounted in the spaces between said inwardly projecting fingers and having trunnions pivotally supported in the trunnion notches in the grate bars.

2,099,523
COLLAPSIBLE CONTAINER
Hubert Jezler, Zurich, Switzerland, assignor to the firm Inga Internationale Nahrungs- und Genussmittel-Aktiengesellschaft, Schaffhouse, Switzerland
Application August 22, 1936, Serial No. 97,367
In Switzerland July 23, 1936
2 Claims. (Cl. 221—60)

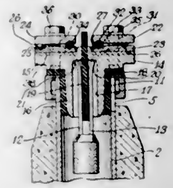
1. A collapsible dispensing container for pastes and liquids, including a pair of walls of dish shape having their peripheries juxtaposed and secured together, said walls being bowed in opposite directions to form a chamber, said chamber having a dispensing outlet, one of said walls being of comparatively stiff structural material to provide relatively high resistance against external pressure, and the other wall being of flexible material whereby upon the application of external pressure thereto it may be forced inwardly into substantially continuous engagement with the other wall to force out the contents of said chamber, and a rigid guard strip secured to said first mentioned wall and overlying and protecting the marginal portions of said second mentioned wall but leaving the center portion exposed for the application of pressure thereto.



2,099,524
STARTER FOR INTERNAL COMBUSTION ENGINES
Hermann Klein, Stuttgart-Feuerbach, Germany, assignor to Robert Bosch Aktiengesellschaft, Stuttgart, Germany
Application April 18, 1935, Serial No. 17,115
In Germany May 7, 1934
7 Claims. (Cl. 123—179)

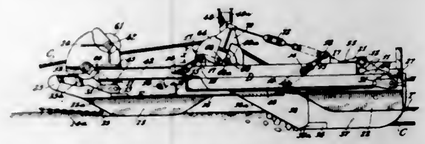
1. A starter for internal combustion engines comprising in combination driving means, an inertia mass driven by said driving means, a casing enclosing said inertia mass, said driving means and inertia mass being mounted together and supported by said casing to form therewith a constructional unit, a transmission gear and clutch and a driving member for engagement with a part of the engine, and means mounting said transmission gear, clutch and driving member together as a constructional unit adapted to be inserted and withdrawn as a whole into and from said casing and a bearing bracket for said driving member secured to said casing and adapted to be connected thereto to detachably connect said units together.

2,099,525
PRODUCTION OF WATER-SOLUBLE AZO DYESTUFFS
Hans Krzikalla, Heinrich Dehnert, and Dieter Vossen, Ludwigshafen-on-the-Rhine, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application February 4, 1936, Serial No. 62,376. In Germany February 19, 1935
14 Claims. (Cl. 260—96)



9. Azo dyestuffs corresponding to the general formula

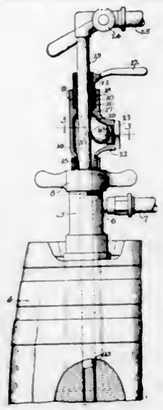
wherein R_1 and R stand for aryl radicles and at least one X stands for an alkyl radicle to which is attached in direct combination with an alkyl carbon atom a quaternary nitrogen atom, the other X being a member of the group consisting of alkyl, cycloalkyl, aralkyl and aryl.



2,099,526
CONNECTER
Frederick C. Lavarack, Montclair, N. J., assignor to Railroad Accessories Corporation, New York, N. Y., a corporation of New York
Application February 18, 1935, Serial No. 6,964
4 Claims. (Cl. 247—3)

1. In a connecter, in combination: a connecter head formed with a skirt having a wire receiving groove therein, a platform for the reception of a connecter plate, and a threaded cavity for the reception of a bolt; a similar but reversely arranged connecter head, each of said heads formed with a through orifice adapted for the reception of a conductor; an insulating body between the heads; means for retaining the heads and insulating body in position; a lower connecting plate resting upon the platform of each head and an upper connecting plate positioned over each lower connecting plate, each lower plate formed with an orifice for the reception of a threaded bolt, the lower plate formed with two semi-circular wire receiving grooves, and the upper plate formed with a wire receiving groove mating with one of the grooves of the lower plate

whereby a conductor may be passed through the orifice in the head, positioned in the wire receiving groove of a head, and clamped between a lower and an upper connecter plate while lying in the groove of the lower plate with the clamping bolt threaded into the threaded orifice of the head, and a conductor may be positioned in the other wire receiving grooves of the lower and the upper plate whereby electrical connection may be made between the said conductors.



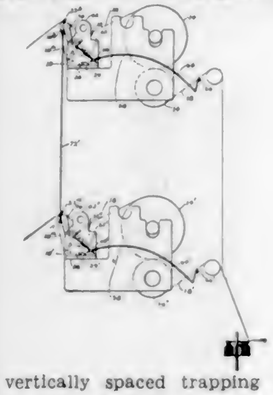
2,099,527
METHOD OF AND APPARATUS FOR LAYING SUBMARINE CABLES
Chester S. Lawton, Ridgewood, N. J., assignor to The Western Union Telegraph Company, New York, N. Y., a corporation of New York
Application February 20, 1937, Serial No. 126,926
19 Claims. (Cl. 61—72)

1. The method of laying a submarine cable which comprises plowing under water a trench in the bed of the body of water in which the cable is to lie, varying the depth of the trench in accordance with the ground resistance offered to the passage of the plow, and simultaneously paying out the cable toward the trench and placing it in the trench as the latter is plowed.

2,099,528
BEER TAP ADAPTER
James McAdams, Chicago, Ill.
Application September 26, 1935, Serial No. 42,205
3 Claims. (Cl. 225—3)

3. A device for the purposes set forth, comprising a valve body formed of a single casting having threads at one end for engagement with a beer tap and having a recess at the opposite end, packing in said recess, a threaded gland engaging with threads in said recess for tightening the packing, said body having a longitudinal passageway for receiving the usual tap rod, said passageway being slightly larger than the rod, a valve seat at the upper end of the passageway, integrally formed curved guides in said body, a ball valve engaging with said guides and adapted to engage with the valve seat, said body having a lateral chamber for receiving the ball valve when

in open position and having a hole in the side thereof for inserting and removing said ball valve, and a plug for closing said hole.



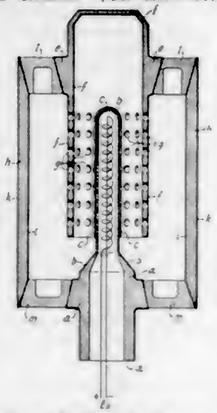
2,099,529
RECOVERY OF SULPHONIC ACIDS
Robert C. Moran, Wenonah, and Walter A. Meyer, Paulsboro, N. J., assignors to Socony-Vacuum Oil Company, Incorporated, New York, N. Y., a corporation of New York
No Drawing. Application August 26, 1936, Serial No. 98,086
2 Claims. (Cl. 260—159)

1. A process for the recovery of petroleum sulphonic acid compounds of low iron content which comprises the following steps: treating a petroleum oil fraction with sulphuric acid, settling and separating from the oil the sludge so produced, adding to the sour oil a small amount of water, separating and withdrawing the resulting acid jelly, neutralizing the acid jelly with an aqueous alkaline solution, settling and separating from the mixture the aqueous solution of alkaline sulphonic compounds, substantially free of iron hydroxide and associated impurities, and salting out the alkaline sulphonic compounds from the aqueous solution.

2,099,530
SELECTIVE STRAND TRAPPING AND CUTTING DEVICE FOR USE IN STRAND DOUBLING OR TWISTING MACHINES
Henry Owens, Providence, R. I., and Samuel Bottomley, North Andover, Mass., assignors to Henry Owens & Company, Inc., Providence, R. I., a corporation of Rhode Island
Application March 1, 1937, Serial No. 128,374
22 Claims. (Cl. 117—32)

1. A device for use in a strand doubling or twisting machine having twisting ring means and a plurality of vertically spaced pairs of strand nip feed rolls and adapted to have horizontally spaced strands passing through the respective vertically spaced pairs of feed rolls comprising horizontally spaced guides for guiding respective strands to said respective feed rolls adapted to be independently pivotally mounted in rear of their respective feed rolls, individual trapping or cutting means for each strand adapted to be independently pivotally mounted in rear of their re-

spective feed rolls and connecting means extending from the respective strand guides to the re-



spective vertically spaced trapping or cutting means.

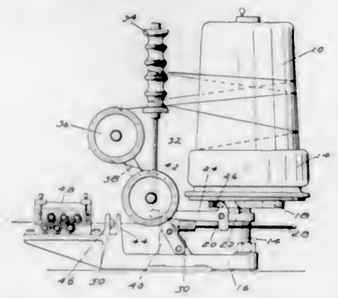
2,099,531

ELECTRON DISCHARGE DEVICE

Gerhard Passarge, Hamburg, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie, m. b. H., Berlin, Germany, a corporation of Germany

Application December 5, 1936, Serial No. 114,385
In Germany November 15, 1935
1 Claim. (Cl. 250—27.5)

In an electron discharge device, an indirectly heated cathode comprising a metal coated sleeve of insulating material, a grid electrode comprising a metal coated cup-shaped ceramic member of larger diameter than and concentric with said cathode and perforated opposite said cathode, and an anode comprising a metal coated ceramic cylinder, and a ceramic ring for insulatingly sealing said cathode tube intermediate its ends in one end of said cylinder and a second ceramic ring for insulatingly sealing gas-tight said grid electrode intermediate its ends in the other end of said cylinder.



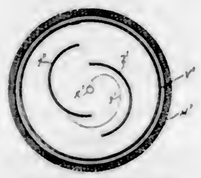
2,099,532

WIRE-HANDLING APPARATUS

Robert C. Pierce, Niles, Mich., assignor to National Standard Company, Niles, Mich., a corporation of Michigan

Application November 29, 1935, Serial No. 52,066
8 Claims. (Cl. 205—13)

1. A unit for feeding wire to a machine having an irregular feed and comprising a swift provided with a brake surface on its bottom and rotatable about an upright axis, a bellcrank lever pivoted below said swift and having one arm provided with a brake engageable with said brake surface and having another arm which extends beyond the periphery of said swift, a spindle carried by and extending upwardly from the end of said other arm and provided with a roller beside said swift, means acting on said bellcrank lever to urge the brake against the brake surface, the bellcrank lever being so constructed and arranged



that tension on a wire unwound from the swift and passing over the roller and tending to draw the roller toward the swift will rock the bellcrank lever against the resistance of said means to withdraw the brake from the brake surface, a wire straightening device including rollers arranged to flex a section of the wire as it is drawn therethrough alternately in opposite directions, means for guiding the wire from the roller to the straightening device, and a die substantially the same size as the wire and through which the wire passes before it reaches the straightening device.

2,099,533

MAGNETRON

Dietrich Prinz, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application July 30, 1935, Serial No. 33,827
In Germany July 5, 1934
3 Claims. (Cl. 250—27.5)

1. An electron discharge device for use at high frequencies and having an evacuated envelope containing a straight thermionic cathode for emitting electrons, means for producing an electromagnetic field parallel to and surrounding said cathode for causing an electron leaving said cathode to move in the spiral path away from said cathode, and a plurality of arcuate anodes parallel to said cathode, said anodes being spaced from the cathode a distance increasing in length in the direction of the path traveled by the electron.

2,099,534

SKYLIGHT OR FLOORLIGHT CONSTRUCTION

Joshua M. Richards, Brookline, Mass.

Application February 4, 1936, Serial No. 62,303
17 Claims. (Cl. 108—16)

1. A skylight, floorlight, or like construction having, in combination, a framework provided with an aperture, a light transmitting element for the aperture, a shield for the light transmitting element secured to the framework, insulating material surrounding the light transmitting element and covering the shield, and sealing compound surrounding the light transmitting element and overlying the insulating material.

2,099,535

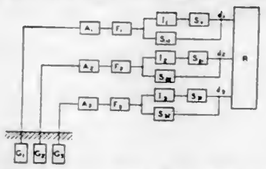
COAT TIE

Morris Rosow, Philadelphia, Pa.

Application May 14, 1937, Serial No. 142,585
5 Claims. (Cl. 2—96)

1. In a device of the character described, in combination, a pair of elastic strap members of unequal length arranged in divergent relation, a terminal securing element commonly affixed to the inner convergent extremities of said members, and quick-detachable fastening elements respectively affixed to the outer divergent extremities of said members.

2,099,536



METHOD AND APPARATUS FOR SEISMIC PROSPECTING

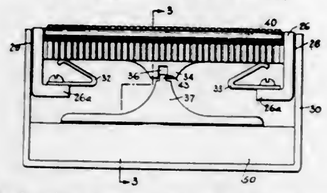
Serge Alexander Scherbatoskoy and Jacob Neufeld, Tulsa, Okla., assignors to Engineering Laboratories, Inc., Tulsa, Okla., a corporation of Oklahoma

Application February 27, 1937, Serial No. 128,264
64 Claims. (Cl. 181—0.5)

1. The method of seismic surveying which comprises creating a disturbance below the earth's surface, receiving the several waves thus formed, translating these waves into electrical vibrations, applying the electrical vibrations to an element responsive to their magnitude and their derivative, recording the output of the said element.

23. In a system for geological surveying, means for creating a disturbance in the earth, means for translating the waves resulting from the disturbance into electrical vibrations, means for creating an electrical effect depending upon a time derivative of the magnitude of the electrical vibrations, means for recording the electric effect.

45. In combination with a geophone a filter, a derivator, means for squaring the output of the derivator, means for squaring the output of the geophone, means for producing the sum of the said squared outputs, means for recording the sum.



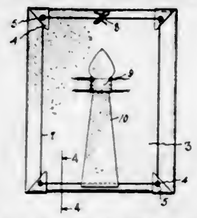
49. The method of seismic surveying which comprises creating a disturbance in the earth, and recording the rate of change of the energy derived from the disturbance.

2,099,537

RAZOR AND HAIR CLIPPER

George Philip Schmitt, New York, N. Y.

Application June 17, 1936, Serial No. 85,625
14 Claims. (Cl. 30—43)



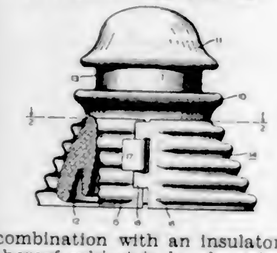
1. A shaving instrument comprising cooperable cutting members, one reciprocable with relation to the other, a support for said members, said members being jointly and freely swingable with relation to said support by skin contact, and reciprocating means for driving said reciprocating member and having an operative connection therewith constructed to maintain the operative connection in different relative positions without preventing said swinging adjustment.

2,099,538

PICTURE FRAME

Alfred H. Schultz, New York, N. Y.

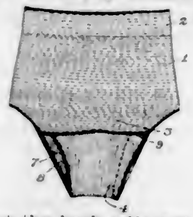
Application September 9, 1936, Serial No. 99,995
9 Claims. (Cl. 40—152)



7. A device of the type described comprising a center support, a cover overlying the rear face of said support and projecting beyond the edges thereof, the projecting edges of the cover being folded over the front of the support and means for securing the edges in folded position comprising tabs formed from the folded edges and in turn folded to the back of the support.

2,099,539
STOCKING
Holly I. Shively, Chicago, Ill.
Application November 7, 1935, Serial No. 48,608
9 Claims. (Cl. 66—182)

1. In a stocking, a welt comprising a series of light weight fabric triangles and a series of heavier weight fabric triangles, the light weight triangles alternating with the heavier weight triangles, the base of each of the light weight triangles being positioned upwardly, and the base of each of the heavier weight triangles being positioned downwardly.

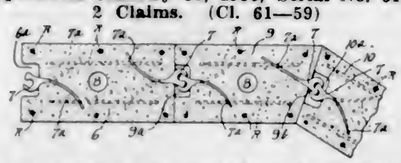


2,099,540
INSULATOR SHIELD
Donald H. Smith, Hempstead, N. Y., assignor to The Western Union Telegraph Company, New York, N. Y., a corporation of New York
Application May 10, 1934, Serial No. 724,972
8 Claims. (Cl. 173—28)

1. In combination with an insulator having a portion thereof subject to breakage by the force of impact of an object, a shield having a substantial portion thereof spaced from and extending over said breakable portion of the insulator to protect the latter from breakage, said shield being turnably mounted to cause the same to turn by the force of impact of an object glancing upon the shield whereby the shock of said impact will be partially absorbed by the turning movement of the shield.

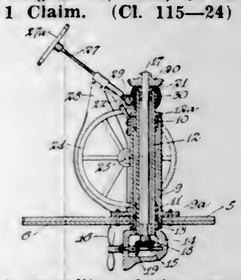
2,099,541
ABDOMINAL BANDAGE AND SUPPORT
Rowland W. Spain, New York, N. Y., assignor of one-half to Henry J. Tully & Company, New York, N. Y., a firm composed of Henry J. Tully and Michael Tully
Application May 19, 1936, Serial No. 80,495
2 Claims. (Cl. 2—41)

1. An abdominal bandage and support comprising a step-in body formed of elastic webbing having its greatest elasticity and resiliency circumferentially, said body having the lower edge substantially straight across the front and from the straight portion inclined upwardly on each side to the center of the back so as to present a comparatively narrow back supporting band and a wide front abdominal support extending between the hips and down to near the crotch, a crotch member having its front end secured to said straight portion with the front end substantially as wide as said straight portion is long, and a pair of diverging elastic members connected respectively to the rear end of said crotch member and to the lower edge portion of said body at



spaced points at the back adjacent the opposite sides of the body for pulling diagonally, rearwardly and downwardly on the side portions of the body for causing a constriction of the lower front part of that portion of the step-in body which extends down to near the crotch for uplifting and supporting the abdomen of the user, and means for securing one end of said diverging elastic members to the lower read edge portion of said body.

2,099,542
INTERLOCKING STEEL SHEET PILING
Edwin Fenton Stevens, St. Paul, Minn.
Application January 31, 1936, Serial No. 61,711
1 Claim. (Cl. 61—58)



Interlocking double walled metal piling comprising a plurality of interconnected pile sections, each section comprising a pair of long channel-like members having central webs closely spaced from each other and each member having outwardly diverging side webs, said side webs terminating in continuous edge interlocking elements and means securing together the central webs of the pair in closely spaced parallel relation.

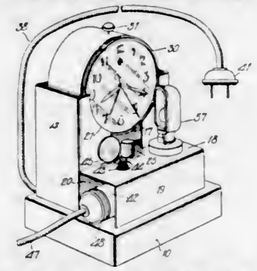
2,099,543
CONCRETE INTERLOCKING PILING
Edwin Fenton Stevens, St. Paul, Minn.
Application January 31, 1936, Serial No. 61,713
2 Claims. (Cl. 61—59)

1. Concrete piling comprising a plurality of elongated concrete pile members of polygonal cross-sectional shape, a pair of interlocking elements for each of said members, each of said interlocking elements having a series of anchoring prongs projecting from the inner side thereof, some of said prongs being bent to one side and some to the other side at different levels, said interlocking elements being associated with respective faces of said member and extending longitudinally thereof, the anchoring prongs of said interlocking elements being embedded in said member, one interlocking element of one member being engageable with an interlocking element of a second member to lock said members together in parallel relation.

2,099,544
BOAT PROPELLING DEVICE
Bogoia Strezoff, Minneapolis, Minn.
Application August 20, 1936, Serial No. 96,992
1 Claim. (Cl. 115—24)

In a boat propelling device, an upstanding mounting adapted to be secured to the bottom of a boat, a hollow casing rotatably mounted within said mounting and extending through the bottom of said boat, a propeller mounted for rotary movement on a horizontal axis, and secured for movement with said hollow casing on a vertical axis, a vertical propeller driving shaft extending upwardly through said hollow casing and said mounting, a power gear mounted beside the exterior of said mounting, a crank shaft for driving said power gear, said hollow casing extending upwardly through said mounting, said vertical drive shaft extending upwardly to a point above said hollow casing, gearing connecting said vertical drive shaft with said power gear, a steering column, gears connecting said steering column to said hollow casing, and a power gear guard element covering at least a portion of said gear, said guard element having a portion extending therefrom, and said extending portion constituting a journalled supporting brace for said steering column.

2,099,545
BELT
Austin A. Teisher and Gordon I. McNeil, Akron, Ohio, assignors to Wingfoot Corporation, Wilmington, Del., a corporation of Delaware
Application February 8, 1935, Serial No. 5,553
3 Claims. (Cl. 74—231)

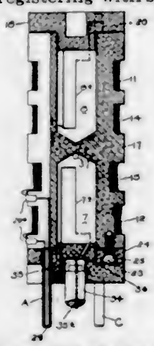


1. A belt comprising a layer or layers of load-carrying cords of alternately opposite twist to effect a balanced running structure, said cords being embedded in rubber, and an envelope of straight cut rubberized fabric surrounding the cords, said envelope being of balanced construction insuring straight running of the belt in use and having longitudinally extending cords of alternately opposite twist.

2,099,546
TREATMENT OF RUBBER
Herman R. Thies, Stow, and George R. Lyon, Akron, Ohio, assignors to Wingfoot Corporation, Wilmington, Del., a corporation of Delaware
No Drawing. Application July 22, 1936, Serial No. 92,014
19 Claims. (Cl. 260—1)

1. The method of producing condensation derivatives of rubber which comprises treating a rubber cement with a condensation agent, terminating the reaction of the condensing agent on the rubber without separating the resulting rubber derivative from the cement and then filtering the reacted cement to remove insoluble impurities.

2,099,547
ALARM CLOCK DEVICE
Richard Varley, New York, N. Y.; Edith Agge Varley executrix of said Richard Varley, deceased
Application October 17, 1935, Serial No. 45,392
15 Claims. (Cl. 58—19)



1. An apparatus of the class described comprising in combination a primary time alarm device including an alarm setting and shut-off mechanism, a secondary alarm means having a less periodicity than said primary alarm device, manually actuated control means for rendering said secondary alarm means operative and inoperative, means operable by the manual actuation of the shut-off mechanism from set to "off" position for actuating said control means to operative position to sound said secondary alarm means, and releasable obstructing means for preventing operation of said manually actuated control means when the latter is in operative position.

2,099,548
APPARATUS FOR TESTING GASES
Louis L. Vayda, Aspinwall, and Raymond H. Rossomme, Wilkinsburg, Pa., assignors to Bacharach Industrial Instrument Company, a corporation of Pennsylvania
Application December 4, 1936, Serial No. 114,208
3 Claims. (Cl. 23—255)

1. In apparatus for analyzing gas which includes a Wheatstone bridge electrical circuit comprising a plurality of resistance coils, an indicator and a pair of balanced resistance wires, one of which is a catalytic agent, a spool of insulating material, upon which said resistance coils comprising legs of the bridge are wound, which is hollowed out so that the walls thereof form two separate chambers, one of which has an outlet opening and contains the catalyzing wire and the other of which contains the other member of the pair of wires, a cap at one end of the spool having an inlet passage therethrough leading to the chamber containing the catalyzing wire, and provided with a plurality of socket pins having electrical connection with said resistance coils and

said wires, and a support provided with sockets for receiving said pins in electrical connection with said circuit and provided with a passage for gas to be tested registering with said inlet passage

through the cap, so that the passage for the gas is connected to the inlet passage when the pins on the cap are plugged into their sockets in the support.

2,099,549

BALL AND SOCKET COUPLING

Edgar E. Watson, Waterloo, Iowa, assignor to The Metalectric Corporation, Waterloo, Iowa, a corporation of Iowa

Application April 14, 1937, Serial No. 136,768

6 Claims. (Cl. 280—33.15)

6. In a connection of the character described, the combination of a socket block provided on its interior with a curvedly walled socket recess having an aperture communicating therewith, a plurality of connecting elements each provided with a head having a convexly curved exterior surface adapted to swivel upon the curved surface of the socket recess, and a dished inner surface, and the heads being adapted when in closely adjacent relation with their dished surfaces presented inwardly to be inserted through the aperture in the socket block and adapted thereafter to be spread to enlarge the space afforded between their dished surfaces, and a locking member adapted to be inserted to lie within the enlarged space thus afforded and configured to thereafter permit the heads to be turned within the curvedly walled socket recess to a position to embrace the locking member and prevent its removal and to likewise prevent removal of the heads of the connecting elements from the socket recess while the locking member is in place, the locking member thus positioned holding the heads in swiveling relation to the socket recess.

2,099,550

ANTIRACHITIC VITAMIN

Adolf Windaus, Goettingen, and Friedrich Schenck, Wuppertal-Elberfeld, Germany, assignors to Winthrop Chemical Company, Inc., New York, N. Y., a corporation of New York

No Drawing. Application March 5, 1937, Serial No. 129,188. In Germany March 20, 1935

11 Claims. (Cl. 260—153)

1. Antirachitically activated 7-dehydrocholesterol.

2,099,551

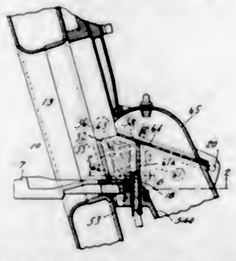
ELECTRICAL SWITCH CONTACTS

Lyall Zickrick, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

No Drawing. Application May 20, 1937, Serial No. 143,762

5 Claims. (Cl. 200—166)

1. A switch contact containing about 1 to 10% lead, about 12 to 27% cadmium, the remainder consisting substantially of metal from the group silver and copper.



2,099,552

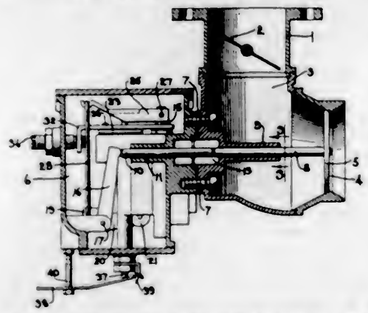
STOKER

Howard P. Anderson, Erie, Pa., assignor to The Standard Stoker Company, Inc., a corporation of Delaware

Application August 21, 1934, Serial No. 740,746

3 Claims. (Cl. 110—101)

1. In combination, a furnace having a wall with a firing opening therein, a stoker feed conduit extending toward said firing opening, said conduit being made of a material having a high aluminum content, the discharge end of said conduit terminating short of said wall opposite said firing opening, filler pieces joining the marginal edges of said firing opening and the discharge end of said conduit, insulating material between the adjacent surfaces of said filler pieces and said wall and insulating material between the adacent surfaces of said filler pieces and said conduit.



2,099,553

CARBURETOR

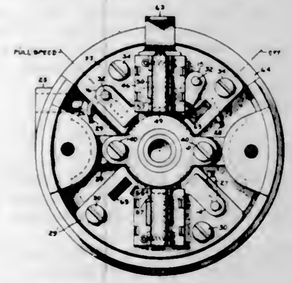
Edward G. Atkins, Jackson, Mich., assignor to E G A Carburetor Co., Jackson, Mich., a corporation of Michigan

Application October 9, 1933, Serial No. 692,774

12 Claims. (Cl. 261—50)

1. In a carburetor, the combination of a fuel reservoir, a connection leading from said reservoir to a source of liquid fuel supply, means for maintaining a constant liquid fuel level, less than full, in said reservoir; a main air passage leading to the intake of an internal combustion engine, spring valve means, leading from atmospheric pressure to the main air passage, said main air passage having a cross sectional area capable of delivering the maximum requirements of the engine; a fuel conduit to the main air passage communicating with the fuel reservoir below the liquid level therein through a port, said port supplying the major portion of the fuel, a branch passage of restricted cross sectional area leading from said fuel conduit to the fuel reservoir above the liquid level therein, said fuel conduit and branch passage being so dimensioned and positioned relative to each other and to the main air passage as to cause the pressure reduction within the main air passage to be directed more to said port than to the space above the liquid level for the purpose described.

10. In a carburetor, the combination of an air admission valve arranged to actuate a fuel admission valve, a spring for normally holding said air valve to its seat and against which said air valve acts throughout its travel, means constituting a leverage between said air valve and spring through which the action of the latter is transmitted to said air valve, said means being so shaped and located with said air valve closed that the effective leverage between the valve and spring is increased as the valve opens to compensate for the increase in the resistance in said spring.



2,099,554

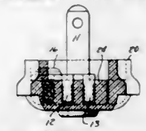
SHIFTABLE BRUSH RIGGING

Robert F. Bean, Bridgeport, Conn., assignor to General Electric Company, a corporation of New York

Application March 16, 1937, Serial No. 131,195

14 Claims. (Cl. 171—323)

14. In combination, a dynamo-electric machine having an end shield, an arcuate slot formed in the edge of said end shield, a brush rigging comprising an electrically conductive element insulated from and mounted on said end shield, a mounting member rotatably supported on said end shield and having an opening therein, said mounting member having a projection thereof extending beyond the periphery of said end shield through said slot therein constituting an adjusting handle, a plate of electrically insulating material formed with an opening therein and secured to said mounting member, and a brush holder including an electric contactor extending through said opening in said mounting member into engagement with said electrically conductive element and being provided with a clamping element having a lug formed thereon extending through said opening in said insulating plate and arranged in clamping engagement therewith.



2,099,555

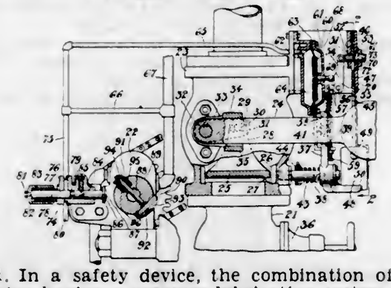
ELECTRICAL CONNECTER

George B. Benander, Yalesville, Conn., assignor, by mesne assignments, to The Monowatt Electric Corporation, Bridgeport, Conn., a corporation of Connecticut

Application October 12, 1929, Serial No. 399,126

10 Claims. (Cl. 173—361)

7. An electrical fitting comprising a contact member of sheet metal having two spaced prongs and a body of non-yielding, non-frangible insulating material having recess means therein to receive the prongs, the end walls of said recess means being spaced apart a distance slightly less than the overall width of the spaced prongs, the prongs being incapable of easy insertion into the recess means but capable of yielding slightly upon being forced into the same, whereby after having been forced therein, they are effectively held against removal.



2,099,556

SAFETY DEVICE FOR ENGINES

Allan O. Carpenter, Corning, N. Y., assignor to Ingersoll-Rand Company, Jersey City, N. J., a corporation of New Jersey

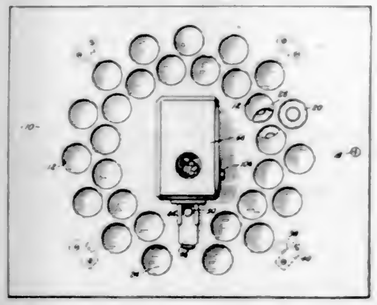
Application September 23, 1936, Serial No. 102,079

4 Claims. (Cl. 137—140)

1. In a safety device, the combination of an engine having a pressure lubricating system and a conduit for conveying power medium to the engine, of a valve to cut off the flow of power medium to the engine and having a lever, actuating means movable by gravity against the lever for closing the valve, a movable support for the actuating means, pressure responsive means subjected to the pressure of the lubricant for normally maintaining the movable support in engagement with the actuating means, means acting responsively to a decreasing pressure in the lubricating system to move the support out of supporting position to enable the actuating means to close the valve, and means acting in response to a predetermined maximum speed of the engine to cause operation of the last mentioned means.

2,099,557

BOTTLE VENDING MACHINE



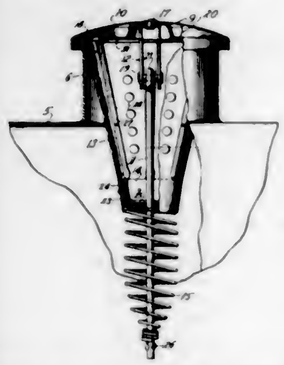
Frank De Mayo, Jr., Kansas City, Mo., assignor to Vendo Sales Company, a corporation

Application August 29, 1936, Serial No. 98,491

12 Claims. (Cl. 312—36)

1. A vending machine of the character described comprising a case; means for holding a

plurality of bottles arranged in an annular path within the case; a stationary plate, provided with openings, in alignment with the bottles, forming one side of the case; a movable plate having apertures therethrough, supported by the stationary plate and disposed between the bottles and said stationary plate; and mechanism, sup-



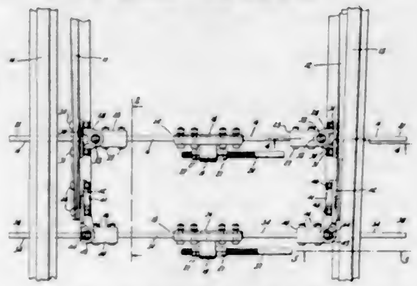
ported by the stationary plate, for moving the movable plate to bring one of its apertures into register with one of the openings of the stationary plate, the remaining openings of the stationary plate being closed by the movable plate while one of its apertures is in register with one of the openings of the stationary plate.

2,099,558

DEVICE FOR CLOSING FILLING OPENINGS OF LIQUID CONTAINERS

Henry G. Dibelka and John D. Cramer, Chicago, Ill., assignors to The Norlipp Company, Chicago, Ill., a corporation of Illinois

Application April 25, 1932, Serial No. 607,332
8 Claims. (Cl. 220—86)



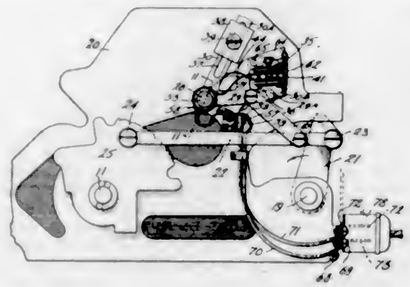
8. A device for closing the filling opening of a liquid container comprising, in combination, an anchor assembly adapted to be positioned on the interior of the container, said assembly including a plurality of resilient strip members arranged around the filling opening in position to permit free passage of liquid into the container while affording obstruction to introduction of a siphoning means therein, a cover cap provided on its under face with a centering flange for engaging in the filling opening, a supporting member adapted to depend from the under face of said cap through the filling opening into the container, and means interposed between said anchor assembly and said supporting member for yieldingly pressing said strip members upwardly against the walls of the filling opening.

2,099,559

RAILWAY SWITCH

Samuel L. Eastburn, Sloatsburg, and Charles Banker, Hillburn, N. Y., assignors to Ramapo Ajax Corporation, New York, N. Y., a corporation of New York

Application December 7, 1934, Serial No. 756,446
6 Claims. (Cl. 246—452)



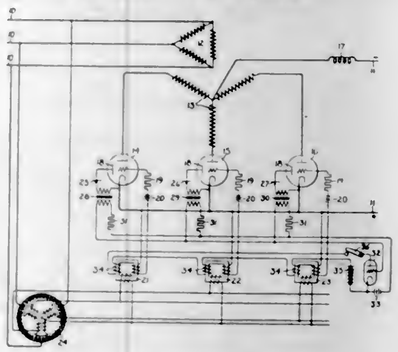
1. In a railroad switch having a stock rail and a switch point cooperating therewith, a clip comprising a flange bolted to said switch point, said flange having a laterally projecting bearing portion open at the bottom thereof, a horizontally extending vertically positioned, flat tie rod passing under said switch point and stock rail, a dog having depending side flanges forming a vertical recess enclosing said rod, fastening devices passing through said side flanges and rod, said dog having an upwardly projecting journal portion fitting within said bearing portion, and a swivel bolt centrally passing through said journal portion and bearing portion, said journal portion extending in above the edge of the switch point base, whereby the dog cannot drop from position even though the swivel bolt breaks.

2,099,560

GOVERNOR FOR ELECTRIC MOTORS

Jerome A. Fried, Ithaca, N. Y., assignor to Allen Wales Adding Machine Corporation, Ithaca, N. Y.

Application July 16, 1934, Serial No. 735,324
14 Claims. (Cl. 200—52)



1. A governor for an electric motor with an electric operating circuit comprising, a mechanism adapted to be driven by said motor in a given cycle, an operating element, means connecting said mechanism to said element for oscillating said element about a fixed axis, a plurality of cycles for each cycle of operation of said mechanism, an inertia element mounted for oscillation solely about the same fixed axis and separately of said operating element in a path approximately parallel to that of said operating element, resilient means connecting said inertia element to said operating element and urging said inertia element about said axis into contact with said operating element for normal oscillation therewith about said fixed axis, but with said inertia element free to lag when its inertia is sufficient to overcome the tension of said resilient means, and switch means connected to said elements and operable automatically to open position upon a lagging of said inertia element upon said fixed axis, whereby when said switch means is connected in series with said motor in said circuit, a lagging of said inertia element on said axis will cause a decrease in the speed of said motor.

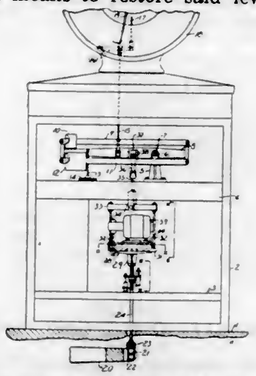
2,099,561

ELECTRIC VALVE CONVERTING APPARATUS

Rolland C. Griffith and Burnice D. Bedford, Schenectady, N. Y., assignors to General Electric Company, a corporation of New York

Application November 25, 1933, Serial No. 699,758
Renewed June 12, 1937
7 Claims. (Cl. 175—363)

1. In combination with a vapor electric valve converting apparatus comprising an anode, a cathode, a control electrode, and a conductive member in contact with the ionized vapor of the apparatus, a saturable control transformer for exciting said control electrode to control the energy transmitted by said apparatus, and means responsive to the potential between said conductive member and said cathode for varying the saturation of said transformer to control the energy transmitted by said apparatus.



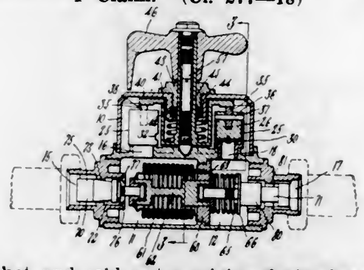
2,099,562

DEVICE FOR MAINTAINING THE CONDITION OF LEVEL OF SUPPORTS

Halvor O. Hem, Toledo, Ohio, assignor to Toledo Scale Manufacturing Company, Toledo, Ohio, a corporation of New Jersey

Application January 16, 1936, Serial No. 59,388
6 Claims. (Cl. 265—27)

1. In a device of the class described, in combination, a load-supporting lever, load-counterbalancing mechanism, means connecting said lever to said load-counterbalancing mechanism, and automatic means for changing the length of said connecting means to restore said lever to sub-



stantially its original position as such load-counterbalancing means is displaced under load.

2,099,563

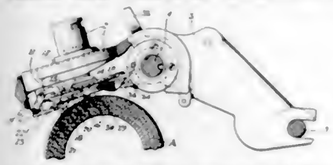
PRESSURE RESPONSIVE MIXING VALVE

Francis L. Henning, Boston, and George W. Bezanson, Winchester, Mass.; said Henning assignor to said Bezanson

Application February 11, 1935, Serial No. 5,976
1 Claim. (Cl. 277—18)

A hot and cold water mixing device having a passage for cold water and a passage including a valve chamber for hot water, a valve in said chamber, and a cylindrical bellows having an end head connected to said valve for actuation thereof, one surface of said end head being exposed to said hot water passage on the discharge side of said valve, the other surface of said end head being exposed to said cold water passage, said valve having a poppet portion adapted to seat at the discharge end of said chamber movable to close said hot water passage tightly and a tapered portion toward the inlet end of the chamber movable to reduce the flow gradually and substantially to close the passage before the poppet portion reaches its seat.

2,099,564



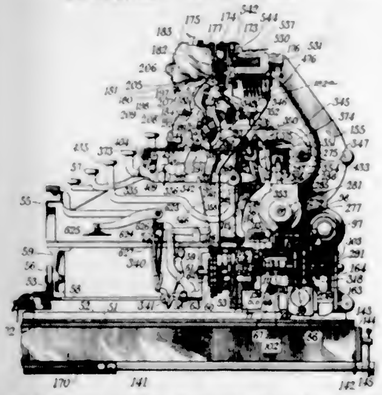
PHONOGRAPH

Charles Huenlich, Bloomfield, N. J., assignor to Thomas A. Edison, Incorporated, West Orange, N. J., a corporation of New Jersey

Application September 15, 1934, Serial No. 744,111
10 Claims. (Cl. 274—34)

6. In a phonographic sound box including a recording stylus adapted to traverse and engrave a groove on a record tablet, and a reproducer stylus, said styli respectively having operative and inoperative positions with respect to said record tablet, the combination of; a reproducer stylus biasing weight, and means to support said weight in predetermined position with respect

to said record tablet when said reproducer stylus is in inoperative position, said means comprising a contact member adapted to glide on the record tablet and resiliently mounted on said



weight, said member being positioned behind said recording stylus with respect to the normal direction of movement of said stylus across the record tablet.

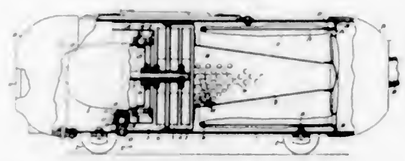
2,099,565

TYPEWRITING AND CALCULATING MACHINE

Alfred G. F. Kurowski, Brooklyn, N. Y., assignor to Underwood Elliott Fisher Company, New York, N. Y., a corporation of Delaware

Application August 31, 1933, Serial No. 687,547
23 Claims. (Cl. 235—59)

1. In a power driven writing-calculating mechanism, the combination with a totalizer; a series of devices to differentially actuate the totalizer; a series of type bars; actuators individual to the differential devices to actuate the latter; a driving element common to the actuators; and normally idle couplers to connect selected actuators with the driving element for operation; of selectively operable manipulative means, each such means including a manually operable lever, and a type bar lever connected with its type bar; coupler-adjusting means shiftable relatively to the actuators and the manipulative means by the manually operable levers; the type bar lever being driven by the actuator to actuate the type bar; and means adjustable to connect and to disconnect the manually operable lever and the type bar lever, and to render effective and ineffective the connection between the manually operable lever and the coupler-adjusting means.



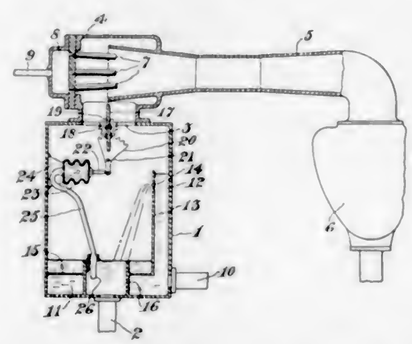
2,099,566

VACUUM CLEANER

Henry T. Lang, Cleveland, Ohio, assignor to Electric Vacuum Cleaner Company, Inc., Cleveland, Ohio, a corporation of New York

Application September 18, 1936, Serial No. 101,461
5 Claims. (Cl. 230—117)

1. In a vacuum cleaner of the type having the suction producing and dust separating means located within an enclosing casing, a cylindrical casing, a fan discharging peripherally to the casing, a shroud ring within the casing and spaced therefrom to provide an annular passage therebetween for the axial discharge of air from the fan, an electric motor for driving the fan



extending axially within said shroud ring, and means for resiliently supporting the motor from the casing including a resilient means arranged between the motor and the shroud ring whereby said resilient means is out of the path of the air discharged from the fan.

2,099,567

REFRIGERATING APPARATUS

John A. MacLean, Hampton, N. J., assignor to Ingersoll-Rand Company, Jersey City, N. J., a corporation of New Jersey

Application August 15, 1935, Serial No. 36,372
3 Claims. (Cl. 62—152)

3. Refrigerating apparatus comprising an evaporator tank having an evaporation compartment therein, a reservoir in the tank, means defining an outlet recess for the tank passing through the reservoir, and means in the tank for delivering the contents of the reservoir to the evaporation compartment.

2,099,568

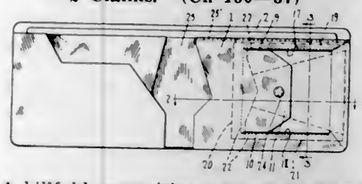
REACTANCE ELEMENT CONTROL

Friedrich Metzger, Berlin-Tempelhof, Germany, assignor to General Electric Company, a corporation of New York

Application December 6, 1935, Serial No. 53,263
In Germany December 15, 1934
7 Claims. (Cl. 172—246)

1. In combination, an alternating current circuit having a potential of varying wave form, a capacitor, a circuit breaker for connecting said capacitor in shunt to said circuit, means responsive to the current in said capacitor for controlling

the opening of said circuit breaker, and means responsive to harmonics in the potential of said cir-



cuit for varying the current setting of said circuit breaker.

2,099,569

BILLFOLD

Louis A. Mueller, Springfield, Ohio, assignor to The Springfield Leather Products Company, Springfield, Ohio, a corporation of Ohio

Application November 25, 1935, Serial No. 51,432
2 Claims. (Cl. 150—37)

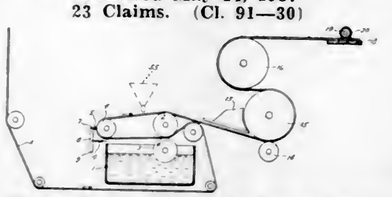
1. A billfold comprising an outer wall having its bottom longitudinal edge and one transverse edge folded back upon itself, an inner wall including an integral body portion, spaced parallel legs, and a flap lying between said legs and independently thereof and connected to the body portion, an inner coin pocket wall sewed to said inner wall inwardly of the flap, a front coin pocket wall having its sides pleated to define side pocket walls, the edges of said coin pocket walls being extended beyond the pleats, one of said legs being folded over the outer edges of the inner and front pocket walls, the inner edges of said pocket walls being received between the folded longitudinal edge of the outer wall, and stitching connecting said edges together.

2,099,570

COATINGS

John D. Murray, Chicago, Ill., assignor to Murray Liquafilm Corporation, Chicago, Ill., a corporation of Illinois

No Drawing. Application October 22, 1934, Serial No. 749,483
8 Claims. (Cl. 134—17)



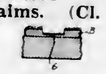
1. That method of making a coating material which comprises heating a mixture made up of cellulose material selected from the group consisting of cellulose xanthate and cellulose acetate and cellulose nitrate and cellulose phthalate, and ethyl cellulose and benzyl cellulose, together with unsaturated oil selected from the group consisting of castor oil and soya bean oil and Chinawood oil and Perilla oil and sunflower oil and cottonseed oil and corn oil and linseed oil, blowing air through the mixture until at least the major part of the cellulose material and the unsaturated oil have combined, and dissolving the blown mixture in a solvent.

2,099,571

METHOD AND MEANS FOR MAKING A COVERING FOR SURFACES EXPOSED TO THE WEATHER

Winfred H. Outman, Richmond, Calif., assignor to Certain-Teed Products Corporation, New York, N. Y., a corporation of Maryland

Application May 29, 1931, Serial No. 540,846
Renewed May 14, 1937
23 Claims. (Cl. 91—30)



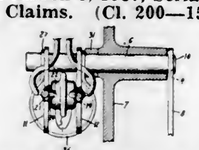
1. The process of treating a sheet of covering material having upon its surface a coating of adhesive material which comprises moving said sheet in the direction of one dimension of its surface, forming channels in said coating extending in the direction of the motion of the sheet, feeding granular material toward said channels, and so adjusting the rate of feed with respect to the rate of movement of the sheet and the width of the channels that the granular material substantially covers the surface of the channels without appreciable deposition upon the surface of the coating adjacent the channels or of excess of said material in the channels.

2,099,572

COVERING FOR SURFACES EXPOSED TO THE WEATHER

Winfred H. Outman, Richmond, Calif., assignor to Certain-Teed Products Corporation, New York, N. Y., a corporation of Maryland

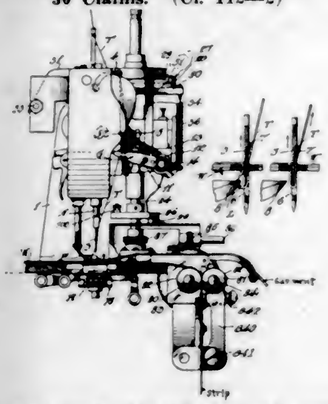
Original application May 29, 1931, Serial No. 540,846. Divided and this application April 30, 1936, Serial No. 77,091
12 Claims. (Cl. 108—7)



1. A covering material comprising a sheet having a depression of defined width formed in a face thereof, and granular material in said depression and susbtantially covering only the surface thereof, said depression and the granular material therein demarking the area of the covering adjacent the depression.

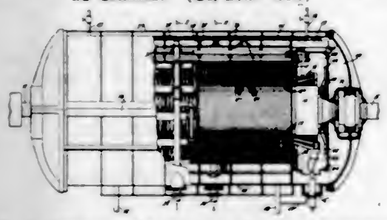
2,099,573

ELECTRIC SWITCH



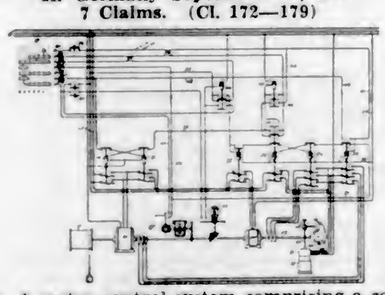
Carl P. Pepper, Fort Wayne, Ind., assignor to General Electric Company, a corporation of New York

Application March 3, 1937, Serial No. 128,809
9 Claims. (Cl. 200—152)



1. In an electric switch, a liquid contact circuit closer having opposed terminals, a shaft, spaced plates on said shaft having contacts adapted to engage said terminals, and a bail having its ends connected to said shaft and its center portion engaging said plates for clamping the plates together whereby the circuit closer is held therebetween.

2,099,574
SLIP STITCH SEWING MACHINE
Herman Rosenman and Leo Roseman, Newark, N. J.
Application April 19, 1935, Serial No. 17,160
30 Claims. (Cl. 112—2)

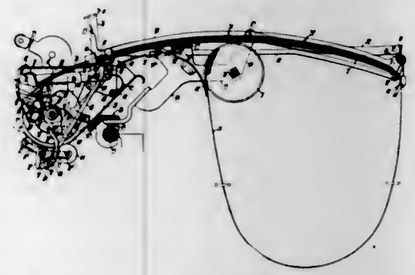


1. In a machine of the character described the combination with work feed mechanism and stitch forming mechanism including a reciprocating needle and a loop taker operable in timed relation for forcing a thread through a piece of work forming a loop in the thread at one side of the work and interlocking another thread through said loop to normally form a line of stitches, of means to grip the needle thread, and means operable in timed relation to the movement of the needle thread by the needle to actuate said gripping means automatically into gripping relation to the thread at intervals, and means for actuating said gripping means in timed relation to the movement of the needle thread by the needle to exert tension on the thread as the needle rises from work penetrating position to prevent formation of loops.

2,099,575
DYNAMO-ELECTRIC MACHINE
Marion A. Savage, Scotia, N. Y., assignor to General Electric Company, a corporation of New York
Application June 24, 1936, Serial No. 86,964
13 Claims. (Cl. 172—252)

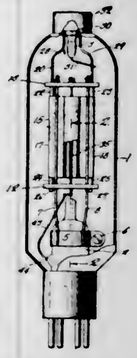
13. A dynamo-electric machine comprising a rotatable member, a frame of longitudinally spaced annular members connected together by circumferentially spaced longitudinally extending tie members attached to the inner and outer peripheries of said annular members, a stationary member supported in said frame and surrounding said rotatable member, a winding in said stationary member having end portions extending beyond the ends of said stationary member, a housing spaced from and enclosing said frame, cooling pads located between and in heat conductive engagement with longitudinally spaced sections of said stationary member in sectors defined by the tie members of said frame and dimensioned to pass between the members of said frame and to and from said winding without interfering with said frame or said winding, said pads in the central portion of said stationary member being spaced from said sections to form passageways in the side walls of said stationary member, and said pads in the ends of said member co-operating with said sections to form imperforate side walls at the ends of said stationary member, means for connecting groups of said pads in series with one another, means for circulating a cooling fluid through each of said groups of pads, the arrangement of said cooling pads relative to one another and to the direction of flow of cooling fluid through said pads being correlated to produce a substantially uniform cooling effect in said stationary member, and means within said housing for circulating a cooling gas between said stationary and rotatable members through said passageways in the central portions of said stationary member and over the end portions of the winding in said stationary member.

2,099,576
CONTROL SYSTEM
Carl Schiebeler, Berlin-Charlottenburg, Germany, assignor to General Electric Company, a corporation of New York
Application August 18, 1936, Serial No. 96,620
In Germany September 20, 1935
7 Claims. (Cl. 172—179)



1. A motor control system comprising a source of voltage, an electric motor supplied from said source, a mechanical brake for said motor biased to braking position, an electro-hydraulic brake operating mechanism energized from said source for releasing said brake, and means responsive to an operating condition of said motor for disconnecting said electro-hydraulic brake operating mechanism from said source and energizing it from a voltage dependent upon the speed of said motor thereby to produce a braking force varying in accordance with the speed of said motor.

2,099,577
ARCH SUPPORT PAD
Myer S. Silver, Brookline, Mass.
Application July 30, 1936, Serial No. 93,455
5 Claims. (Cl. 36—71)

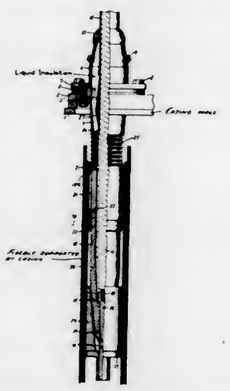


1. An arch support pad comprising a body portion of resilient, soft sponge rubber having a thin peripheral edge and a top layer of felt material of uniform thickness, said top layer being of slightly less area than the area of the top surface of said body portion and having its peripheral edge enclosed by the marginal portion of said body portion.

2,099,578
TYPEWRITING MACHINE
Burnham C. Stickney, Hillside, N. J., assignor to Underwood Elliott Fisher Company, New York, N. Y., a corporation of Delaware
Application October 21, 1933, Serial No. 694,585
38 Claims. (Cl. 197—131)

5. In a typewriting machine, the combination with a revoluble platen, of a collating-table having a side gage and extending rearwardly from the delivery side of the platen, a front sheet-gage movable into and out of effective position upon the upper part of the platen; a supply of carbon-web mounted adjacent the collating-table, and a sheet-clip carried by the platen and closable upon the forward edges of the gaged sheets, the carbon-web hanging in a loop under the rear of the collating-table, said carbon-web supply being mounted under said collating-table between the front and rear ends thereof.

2,099,579
VACUUM TUBE
Warren G. Taylor, Chicago, Ill.
Application July 9, 1936, Serial No. 89,781
9 Claims. (Cl. 250—27.5)

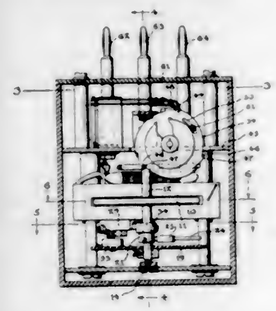


7. The tube of claim 6 wherein leads sealed in said first press are connected to said cathode, a lead sealed in said first stem remote from said first press is connected to said grid, and wherein a lead sealed in said second press is connected to one of the anode supporting rods.

2,099,580
SWITCH HANDLE
Fred H. Travers, Stratford, Conn., assignor to General Electric Company, a corporation of New York
Application January 25, 1936, Serial No. 60,866
6 Claims. (Cl. 287—53)

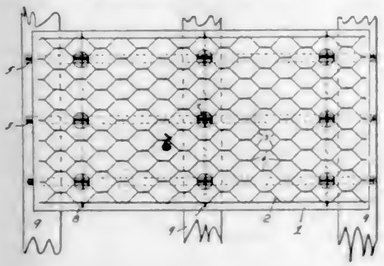
1. A handle comprising a body of insulating material having a cavity therein, and means for connecting said handle to a member to be operated thereby including a metal member having a prong pressed into said cavity and frictionally held therein by engagement of the edges of the prong with the cavity, said prong having an arch-shaped portion so that the compressive forces exerted on the edges of the prong tend to flex the prong intermediate its edges.

2,099,581
TERMINAL FOR LEAD COVERED CABLES
Harold R. Turner, Pittsfield, Mass., assignor to General Electric Company, a corporation of New York
Application March 6, 1935, Serial No. 9,629
6 Claims. (Cl. 173—353)



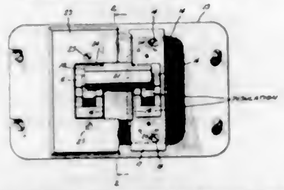
1. In combination, a casing having an opening in a wall thereof, a housing supported by the casing and having a portion extending through the opening into the casing, a cable comprising an insulated conductor extending through the housing into the casing, the inner end of said conductor being unrestrained as to longitudinal movements, a sheath for the cable terminating within the housing and secured to the outer end thereof, a tubular insulator located wholly within the casing in spaced relation to the inner end of the housing, said conductor extending through said insulator, a metallic terminal rigidly secured to the conductor and forming a support for the inner end of the insulator, and a tubular flexible member surrounding the conductor, said member being connected at its inner end to the tubular insulator and at its outer end to the portion of the housing located within the casing.

2,099,582
BRAZING FLUX
Irving R. Valentine, Erie, Pa., assignor to General Electric Company, a corporation of New York
No Drawing. Application February 7, 1935, Serial No. 5,500
6 Claims. (Cl. 148—26)



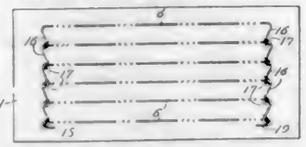
4. A flux consisting of a mixture of an acid fluoride of an alkali metal and boric acid with or without water.

2,099,583
FLASHER MOTOR UNIT
Sidney C. Vincent and Frederick C. Volkman, Baltimore, Md.
Application February 25, 1935, Serial No. 8,182
9 Claims. (Cl. 171—222)



1. A motor unit comprising a single air core field coil, a shaft mounted exterior of said coil, a rotor carried by said shaft and a magnet adapted to maintain said rotor in a definite position with respect to said coil whereby the greatest starting torque is available when said motor is started.

2,099,584
COMPOSITE LATH
George F. Voight, Oakland, Calif.
Application May 16, 1936, Serial No. 80,124
4 Claims. (Cl. 72—116)

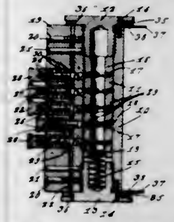


3. In combination, a backing sheet, a plurality of channeled stiffening strips on the rear face of said backing sheet, a metallic net structure disposed across the front face of said backing sheet, portions of said net structure projecting through said backing sheet and bearing against opposed portions of said stiffening strips, and means for holding said last named portions and said first named portions in bearing engagement.

2,099,585
CIRCUIT BREAKER
Fred G. von Hoorn, Bridgeport, Conn., assignor to General Electric Company, a corporation of New York
Application September 23, 1936, Serial No. 102,155
6 Claims. (Cl. 200—18)

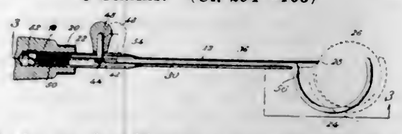
1. An operator for simultaneously operating a plurality of circuit breakers between open and closed circuit positions, said circuit breakers being supported in side-by-side relation and each including a casing having an operating lever extending outwardly from one wall thereof, said operator comprising a handle portion substantially U-shaped in cross-section extending inverted across at least two of said circuit breakers, and guide members extending outwardly from said U-shaped portion slidably engaging said circuit breaker casings for supporting said U-shaped portion with its open side adjacent said circuit breakers so that said operating levers extend thereinto, said guide portions supporting said handle portion for slidable movement in a direction at right angles to said handle portion whereby the side walls of said U-shaped handle portion engage and move said operating levers simultaneously to operate said circuit breakers.

2,099,586
REINFORCED FABRIC AND METHOD OF MAKING SAME
Harold E. Williams, Carthage, Mo.
Application January 29, 1937, Serial No. 122,976
13 Claims. (Cl. 140—93)



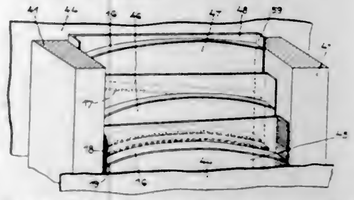
1. The method of reinforcing fabric consisting in interweaving wires parallel with each other through the fabric, with the end portions of the wires at one side of the fabric, forming said end portions into lateral arms each with a loop at its free end, and disposing the wires in the loops of adjacent wires.

2,099,587
CRASH CAUSE RECORDER FOR AIRCRAFT
Sidney G. Allen, Raleigh, N. C.
Application January 30, 1937, Serial No. 123,272
4 Claims. (Cl. 116—135)



1. A crash cause recorder for aircraft comprising a supporting cylinder, means for securing the cylinder to aircraft within convenient reach of a pilot, spring pressed recording plungers, distinctive legends associated with respective plungers designating probable causes of a crash, and a plurality of locking discs carried by the cylinder and corresponding to respective plungers, the discs being so shaped and arranged

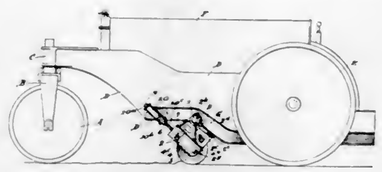
that when a selected plunger is set in locking engagement with its respective disc by a pilot



it will be impossible to release the set plunger or to operate any of the remaining plungers.

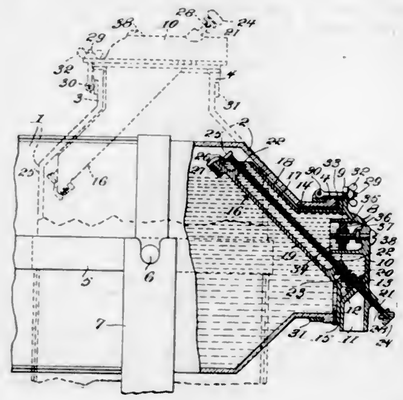
2,099,588
EGG HANDLING TOOL
Norman J. Annema, Grand Rapids, Mich.
Application April 20, 1936, Serial No. 75,462
6 Claims. (Cl. 294—103)

1. An egg handling tool comprising a handle, a tubular shank carried thereby, an egg-gripping element having a part slidably arranged within the shank, and another part positioned exteriorly thereof and cooperating with one end of the shank for gripping an egg.



2,099,589
SKELETON STRUCTURE
Ludwig Armbruster, Berlin-Zehlendorf, Germany
Application October 31, 1935, Serial No. 47,689
In Germany October 5, 1933
27 Claims. (Cl. 20—4)

1. In a building wall or ceiling structure or the like, the combination of intersecting structural members defining substantially rectangular bays, diagonally disposed bracing tension members for rigidifying said bays, said members being secured at intervals to said structural elements, and to each other where they intersect, insulating panels disposed across said bays and secured to said structural members.

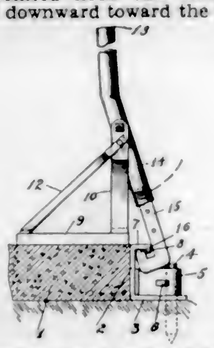


2,099,590
ROAD ROLLER
Andrew W. Aitken, Springfield, Ohio, assignor to The Buffalo-Springfield Roller Co., Springfield, Ohio, a corporation of Ohio
Application March 2, 1937, Serial No. 128,661
12 Claims. (Cl. 94—50)

1. In a road vehicle having a wheeled frame; guides fixedly mounted on the frame adjacent the center of the vehicle; a substantially rigid sub-frame slidably mounted in the guides; a rotatable ground roll carried by said sub-frame and adapted to support the greater portion of the weight of

the vehicle when the roll is in operative position engaging the ground; and means for shifting the sub-frame to move said roll into and out of operative position.

2,099,591
VOLUMETRIC LIQUID DISPENSER
William E. Barrott, Aurora, Ind.
Application June 18, 1936, Serial No. 85,971
6 Claims. (Cl. 221—98)

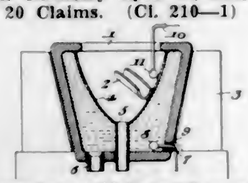


1. A closure of the class described for attachment to a bottle having a body portion and a reduced neck portion comprising, a cover section for attachment to the mouth of the bottle and having an outlet port therein, a spout section having its discharge end connected with the cover and communicating with the outlet port thereof and extending from the inner side of the cover section obliquely thereof for location of its inner receiving end adjacent to the said wall of the body portion of the bottle and communicating at its other end with said outlet port, and a manually manipulative valve means normally closing communication between the discharge end of the spout and the outlet port of the cover.

2,099,592
FORM PULLER
James F. Barton, Edwardsville, Ill.
Application February 18, 1937, Serial No. 126,399
4 Claims. (Cl. 254—132)

3. A form puller comprising a lever, a fulcrum support therefor, and a J-shaped hook depending from said lever characterized by an up-

turned, flat-pointed hook end having its flat point inclined downward toward the shank from



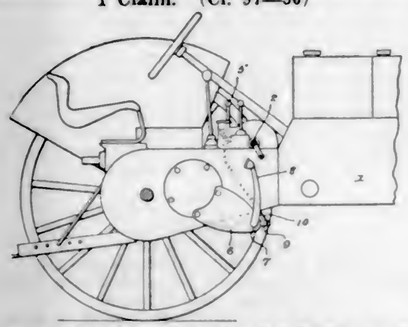
its extreme outer point, substantially as described.

2,099,593

PROCESS FOR REFINING OR SEPARATING ELECTRICALLY CONDUCTIVE LIQUIDS

Karl Bender, Wetzlar an der Lahn, and Max Bunke, Tiefenbach Kreis Wetzlar, Germany, assignors to Buderus'sche Eisenwerke, Wetzlar, Germany, a corporation of Germany

Application April 11, 1936, Serial No. 73,972
In Germany April 12, 1935
20 Claims. (Cl. 210—1)



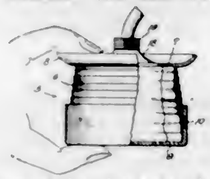
1. A process for purifying and separating electrically conducting liquids which are not decomposed under the influence of electricity, comprising whirling the conducting liquid in a stationary vessel by the application to said liquid of a rotary magnetic field, and removing constituents of different specific gravity from parts of the paraboloid of revolution formed by the whirling liquid, at different distances from the axis of rotation.

2,099,594

POWER LIFT LEVER

Algot S. Bloomquist, Paxton, Ill.

Application September 14, 1936, Serial No. 100,712
1 Claim. (Cl. 97—50)



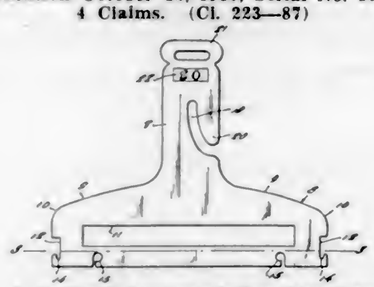
In combination with a tractor having an implement lift and a clutch therefor provided with a hand controlled lever, an ear formed on said lever, spaced plates secured on the tractor, a shaft journaled on said plates, a foot pedal formed on one end of the shaft, an arm secured on the other end of the shaft, and a link connecting said arm to said ear whereby movement of the hand lever may be caused through the actuation of the pedal by an operator's foot.

2,099,595

COLLAPSIBLE REFILL JAR

Kenneth N. Brown, New York, N. Y.

Application November 17, 1936, Serial No. 111,290
2 Claims. (Cl. 221—78)



1. A dispenser of the character described comprising in combination, an end-wise contractable casing, a refill cartridge fitting into said casing and comprising rigid end walls, and a cylindrical wall of collapsible sheet material joining said end walls, one of said end walls including a threaded ring secured to said cylindrical wall and a plug having a nozzle therein, for engagement in said threaded ring.

2,099,596

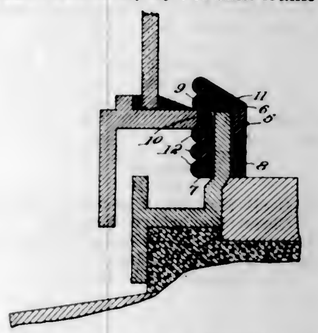
MULTIPLE PURPOSE GARMENT HANGER

Lee P. Bruening, Butte, Mont., assignor of one-third to Frederick Goggin, Butte, Mont.

Application October 12, 1936, Serial No. 105,340
4 Claims. (Cl. 223—87)

1. A garment hanger of the class described comprising a single body of flat material uniform in thickness throughout its dimensions, said body being of general T-shaped form, the head thereof constituting a coat, trousers and skirt hanger, the stem thereof constituting suspension means, said stem portion being provided in one longitudinal edge intermediate its ends with a suspension hook and being provided at its top with a handle, said handle being of loop-like form whereby to provide for satisfactory accommodation of the hand.

2,099,597



WEATHER STRIP FOR METAL SASH WINDOWS

Frank L. Carr, Jr., Maplewood, Pa.

Application March 30, 1936, Serial No. 71,708
2 Claims. (Cl. 20—69)

1. A weather strip comprising a body of yieldable material having a channel formation for receiving abutment flanges of window frames, and

a plurality of closely spaced corrugations provided on one side of said body and extending longitudinally thereof, said corrugations adapted to be engaged selectively by the sash frame whereby

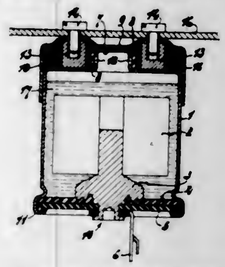
the raised portion of the corrugation engaged will be depressed to receive the sash frame at the point of contact and the adjacent raised portions of the corrugated face of the body will be enlarged and overlap opposite side edges of the sash frame.

2,099,598

FIBERBOARD

John D. Carter, Lansdowne, Pa., assignor to Philadelphia Quartz Company, Philadelphia, Pa., a corporation of Pennsylvania

Application March 27, 1935, Serial No. 13,335
2 Claims. (Cl. 154—40)



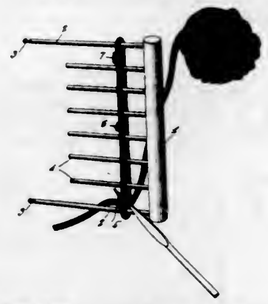
1. In the preparation of a composite fiber structure, the plies of which are united by an adhesive containing a partly neutralized alkali-metal silicate, the step of rendering the adhesive practically insoluble by keeping it in a humid atmosphere at a temperature of at least 60° C. for a period of at least 45 minutes.

2,099,599

ELECTROLYTIC DEVICE

Cornelis de Lange, Eindhoven, Netherlands, assignor to N. V. Philips Gloeilampenfabrieken, Eindhoven, Netherlands

Application December 17, 1935, Serial No. 54,881
In Germany January 7, 1935
7 Claims. (Cl. 175—315)



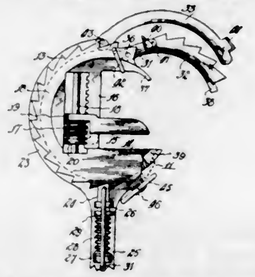
1. An electrolytic condenser comprising, a container having a closed end, an anode within said container and having an external connection at the other end thereof, a cup-shaped member mechanically secured at the closed end of said container, an exhaust device within the space formed between said member and the closed end of the container, and means positioned within said space for supporting the condenser.

2,099,600

CROCHETING FORK

Charlotte I. Denner, Santa Rosa, Calif.

Application November 11, 1936, Serial No. 110,391
1 Claim. (Cl. 28—15)



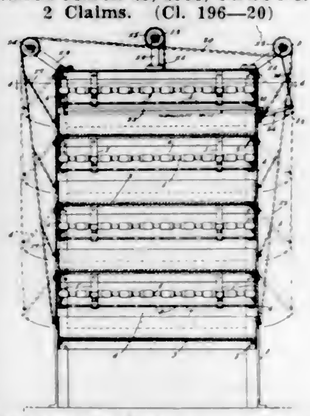
A crocheting fork comprising a rod-like body, relatively long prongs secured to and extending at right angles from adjacent the ends of the body and having work receiving openings therein adjacent to their outer ends, and short prongs secured to said body between the long prongs and all of the prongs being disposed in parallel equidistantly spaced relation to each other.

2,099,601

RATCHET WRENCH

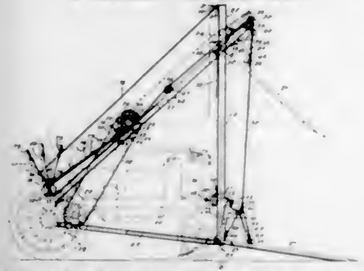
George W. Fields, Atlanta, Ga.

Application March 7, 1936, Serial No. 67,726
1 Claim. (Cl. 81—60)



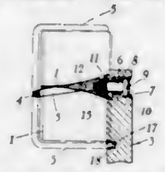
A ratchet wrench comprising a ratchet wheel with a fixed jaw and an adjustable jaw for engaging the object to be turned and having a peripheral groove alongside of the ratchet teeth, a ring turnable in the groove and having a handle formed integrally therewith, a segmental portion of the ratchet wheel and ring, respectively, being cut out to provide an opening at one side of the wrench leading to the jaws, said segmental portions being hinged at one end to the ratchet wheel and ring respectively, means for locking the segmental portions in closed position, spaced apart apertured lugs on the handle of the turnable ring, a spring actuated pawl slidable in the lugs to engage the ratchet wheel, and an operating rod attached to the pawl and extending longitudinally of the handle, the outer end of said operating rod being turned upwardly adjacent the outer or gripping portion of the handle for convenience in releasing the pawl.

2,099,602
LUMINESCENT GLASS
Hellmuth Fischer, Ilmenau, Germany
No Drawing. Original application February 21, 1934, Serial No. 712,440. Divided and this application February 21, 1936, Serial No. 65,064. In Germany May 20, 1933
7 Claims. (Cl. 106—36.1)



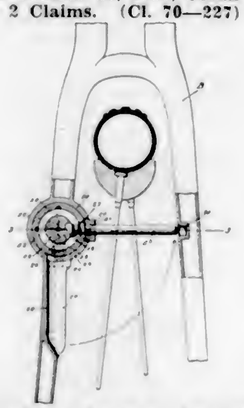
1. A glass, containing in solution a luminescence-affording compound of tin, and having an iron oxide (Fe_2O_3) content in an amount not exceeding 0.05%.

2,099,603
WAX SWEATING OVEN
Adolf B. Gauschemann, Bayonne, N. J.
Application March 23, 1936, Serial No. 70,538
2 Claims. (Cl. 196—20)



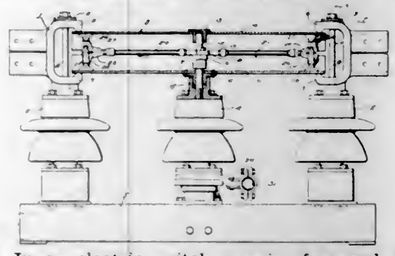
1. A wax sweating device comprising a supporting structure, a plurality of trays mounted in the supporting structure and spaced from each other, heating coils carried by the supporting structure and arranged between the trays, doors hinged to the supporting structure on two opposite sides of said sweating device to depend against the trays and close the spaces on said sides between the trays, and a thermostatically controlled means responsive to temperature changes within the sweating device for regulating the position of the doors.

2,099,604
TRACTOR OPERATED HAY LOADER
Russell Gunning, Tipton, Ind.
Application June 16, 1936, Serial No. 85,603
4 Claims. (Cl. 214—113)



1. A hay loader comprising a rake, frame bars adapted to detachably secure the rake to a tractor, vertical track rails carried by the frame bars, upwardly extending lever arms on the rake, upper and lower rollers on the lever arms guiding movement of the rake on the track rails, an operating cable connected to the rake for raising and lowering the rake on the track rails, members forming the upper ends of the track rails and swingable downwardly and forwardly to carry an upper roller of the rake forwardly and pivot the rake on a lower roller thereof to dump the load by swinging the rake downwardly, and means for controlling the position of said upper end members with respect to the lower portions of the rails.

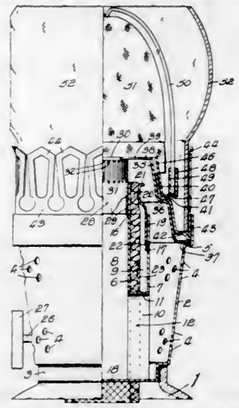
2,099,605
RAZOR
Kenneth Cecil Hanson, Clairinch, High Pine Close, Weybridge, England
Application March 10, 1936, Serial No. 68,141
In Great Britain March 13, 1935
10 Claims. (Cl. 30—35)



1. A safety razor comprising, in combination, a handle, a single edged blade normally having its cutting edge in a plane at right angles transversely to said handle, means for mounting said blade on said handle which permit of the blade being displaced to bring its cutting edge into a longitudinal plane passing substantially through the longitudinal centre line of the handle, means for positively locating the blade in normal and longitudinal positions, a guard member arranged parallel to the cutting edge of the blade at a short distance therefrom, said guard member being mounted on said blade for movement across the cutting edge, means for limiting the extent of movement of the guard to either side of the cutting edge, and means for locking said guard member in its mid-position opposite to said edge.

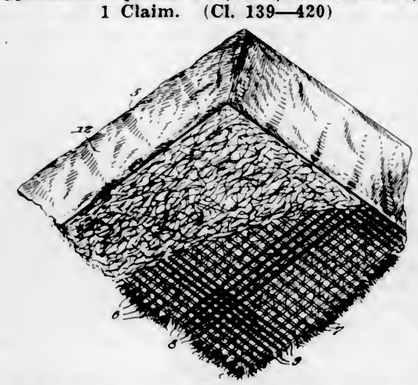
2,099,606
BICYCLE LOCK
Ralph P. Holsen, Milwaukee, Wis.
Application October 20, 1936, Serial No. 106,654
2 Claims. (Cl. 70—227)

1. A lock of the character described comprising a housing for carriage upon a wheel fork of a bicycle frame, a turning casing fitting said housing and having a barrel extension, a locking bolt slidable in said barrel extension, a tumbler cylinder fitted within the housing and said casing and having a cam for action upon the bolt to move it to locking position, the bolt when in locking position being adapted to bridge a spoked portion of a bicycle wheel, and means acting with the bolt to hold it in working relation to the cam, the said fork having a recess for accommodating the bolt when in unlocked position.



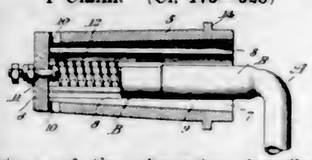
2,099,607
SWITCH
William R. Huttinger, Lansdowne, Pa.
Application August 31, 1935, Serial No. 38,827
9 Claims. (Cl. 200—48)

1. In an electric switch, a pair of spaced stationary contact members, a rotatable support interposed between said stationary contact members, a contact member carried by said support and movable as a unit thereby to bring the ends of the said contact member into and out of cooperative relation with said stationary contact members, said movable contact member comprising a pair of adjacently-disposed coextensive rigid blades adapted for transverse bodily movement toward and away from one another, said blades being incapable of any appreciable flexing throughout their entire length, actuating members arranged axially of said movable contact member between said blades, cooperating cam members pivotally attached to said blades at each end of said movable contact member, toggle members connecting the outer ends of said actuating members to said cam members, and means operable by said support for moving said actuating members axially of said movable contact member when the ends of the movable contact member are in cooperative relation with said stationary contact members, whereby to forcibly move said blades bodily in transverse relation to one another to effect engagement thereof with said stationary contact members.



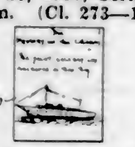
2,099,608
LATERAL DRAFT BURNER
William J. Keller, St. Louis, Mo.
Application September 20, 1935, Serial No. 41,430
7 Claims. (Cl. 67—38)

1. A kerosene lamp burner having, in combination, a tubular base cage having a perforated wall and provided with an internal shoulder adjacent its upper edge, a pair of concentrically arranged burner tubes so dimensioned apart as to provide a wick passage therebetween, the inner of said tubes projecting beyond the upper edge of the outer tube and serving to form an upright central air passage, lateral air inlets communicating with the lower end of the upright central air passage, a tubular wick receivable in the wick passage, the lower end of the wick being split whereby the wick straddles the lateral air passages, a removable tubular burner member having a reduced neck portion and an outstanding flange telescopically connected with the upper end of the outer burner tube to reduce the dimension of the wick passage, the flange at upper end of the inner tube, a deflector member adapted to lie in an approximate plane with the burner end of the inner tube, a deflector member removably supported by the internal shoulder on the tubular base cage, said member having an annular shoulder midway its ends, a chimney



supporting basket having an annular shoulder removably seated on the deflector member shoulder, a generator cap removably and telescopically supported within the upper end of the inner burner tube, and a mantle supporting member removably seated on the shoulder of the chimney supporting basket, and means whereby the wick can be raised and lowered.

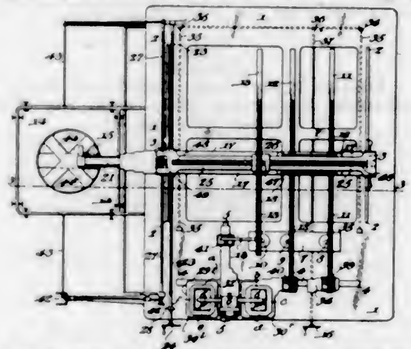
2,099,609
BLANKET
Thomas K. Keen, New York, N. Y., and Thomas F. Gibboney, Reedsville, Pa.
Application September 10, 1936, Serial No. 100,170
1 Claim. (Cl. 139—420)



A blanket comprising warp and weft threads formed of wool having comparatively long staple, a plurality of series of relatively smooth surfaced worsted threads interwoven at spaced intervals throughout the length and breadth of the blanket in lieu of the aforesaid long staple threads, the wool warp and weft threads being napped and felted to confine the worsted threads whereby transverse and longitudinal areas of less density constituting air passages are formed in the blanket between the worsted threads and the napped and felted woolen threads.

2,099,610
RECEPTACLE AND SOCKET FOR NEON TUBES
William Ledder, St. Louis, Mo.
Application June 16, 1936, Serial No. 85,619
1 Claim. (Cl. 173—328)

A fixture of the character described comprising a tubular receptacle forming a socket closed at one end and open at its opposite end, said receptacle being tapered in the direction of its closed end, and internal ribs formed from the side wall of said receptacle and longitudinally disposed therein for effecting drainage grooves therebetween, the ribs being parallel to each other at their apexes and the grooves gradually sloping from the closed end to the open end of the socket.



2,099,611
PICTURE CRIME MYSTERY GAME
Monroe B. Levoy, Great Neck, N. Y.
Application April 20, 1937, Serial No. 138,012
1 Claim. (Cl. 273—152)

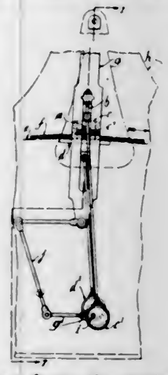
A group of cards for use with other like groups of cards in a game involving a crime, puzzle or mystery, the cards being numbered in regular order and illustrating, in that order, by means of pictures and legends, the consecutive steps involved in the commission and solution of the crime, puzzle or mystery, the group of cards comprising, as a part thereof, a set of clue cards, each bearing the same number, which number is intermediate the numbers of the first and last cards of the group, the several clue cards being substantially identical, except for a feature individual to and characteristic of that clue card, said feature constituting the clue individual to that clue card, the group of cards also comprising a set of solution cards, corresponding, respectively, with the several clue cards, the solution cards all bearing the same number, which number is the last of the series, the several solution cards giving a plurality of different solutions for the crime, puzzle or mystery, the solution cards being substantially identical except for a feature individual to and characteristic of that solution card, said feature of a particular solution card matching identically with the particular clue on the corresponding or matching clue card.

2,099,612
SCULPTURE
Jose Limeses, Antonio Maria Martin Tomás Manuel Saralegui, and Carlos Alberto Pérez del Cerro, Buenos Aires, Argentina
Application February 3, 1933, Serial No. 655,132
Renewed December 10, 1936. In Argentina May 20, 1932
12 Claims. (Cl. 41—25)

1. An apparatus of the character described comprising movable plates for supporting stereoscopical photographs, a carriage mounted for movement in two directions, a sculpture tool actuated by said carriage, means for displacing one of said plates, means for imparting movement of said plate to said carriage, means for imparting movement of the carriage to the other plate, and means for actuating the carriage to effect displacement of the second mentioned plate.

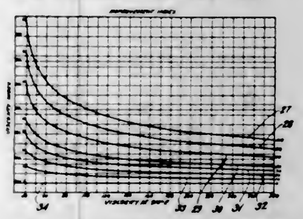
3. The herein described method of photographing objects comprising, locating a stereoscopic photogrammetric camera having right and left objective lenses successively in three positions relative to said object with the main optical axis of one lens passing through one and the same focal point in each location of said camera.

8. A sculptured reproduction of an object comprising a mechanically executed counterpart of pairs of stereograms of the object photographed from different angles and as viewed through a stereoscope.



2,099,613
ERASER
Julian S. Loewus, Atlanta, Ga.
Application May 25, 1935, Serial No. 23,487
18 Claims. (Cl. 120—36)

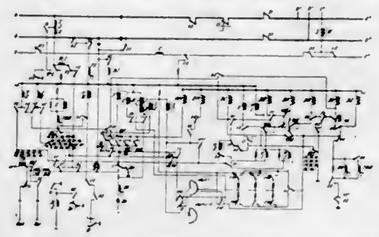
16. A cap eraser comprising a body of frangible non-metallic erasing material and a flexible reinforcement of a non-frangible erasing material incorporated therewith to prevent crumbling and breaking thereof.



2,099,614
STAMPING AND EMBOSSING MACHINE AND IN PARTICULAR BISCUIT MAKING MACHINES
Leonard Marsden, Newton-le-Willows, Lancashire, England, assignor of one-third to Jack Lapidus, Manchester, England, and one-third to Percival Marsden, Edmonton, Alberta, Canada
Application March 18, 1937, Serial No. 131,638
In Great Britain February 5, 1936
11 Claims. (Cl. 107—26)

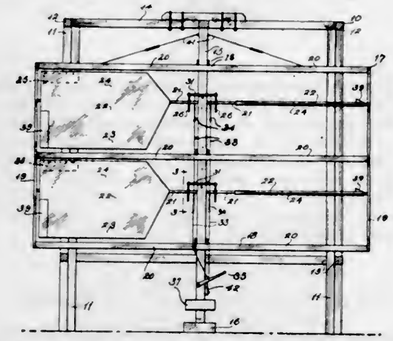
1. In a stamping or embossing machine having a table to support the work and a two-part tool to treat the work, the parts of the tool having independent movement towards and away from the table, means for moving the table to-

wards and away from the tools, and means for allowing one part of the tool to withdraw from the work after the other part has begun but before it has completed its operation.



2,099,615
PROCESS FOR TREATING MINERAL OILS
Wilbert B. McCluer and Merrell R. Fenske, State College, Pa., assignors to Pennsylvania Petroleum Research Corporation, a corporation of Pennsylvania
Application April 26, 1934, Serial No. 722,594
4 Claims. (Cl. 196—13)

1. A process comprising contacting a lubricating oil of Pennsylvania grade with phenyl ethyl alcohol under conditions causing the formation of two liquid phases, and separating said phases to produce oil portions respectively of higher and lower gravity index.

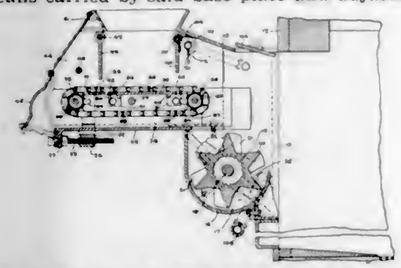


2,099,616
TIME AND ZONE METERING DEVICE
Otto Muck, Marquartstein, and Ludwig F. Muller, and Paul Zier, Munich, Germany
Application August 29, 1935, Serial No. 38,466
In Germany April 28, 1931
34 Claims. (Cl. 179—7.1)

1. A device for time and zone metering in telephone systems, comprising means for ascertaining the zone value of a connection, a time switch device and a movable meter stepping device, said time switch device being adapted at intervals of time corresponding to the unit periods of conversation to start a movement of said meter stepping device, and said meter stepping device being provided with means adapted to limit the movement thereof to an extent determined by the ascertained zone value and by the time interval at that moment; the last named means being arranged in several groups, each group corresponding to a zone value and the means within

each of said groups corresponding to a different interval of time.

2,099,617
FLUID CURRENT MOTOR
Orvis K. Nelson, Pawhuska, Okla.
Refiled for abandoned application Serial No. 16,883, April 17, 1935. This application September 21, 1936, Serial No. 101,839
6 Claims. (Cl. 170—27)



1. In a motor of the character described, a rotor having vanes pivoted for movement to and from operative position on respective axes spaced from the medial lines of the vanes, so that each vane constitutes one wide portion and one narrow portion at respective sides of the axis, a control device including a coaxial shaft fixed with each vane, radial arms on the shaft at an angle of ninety degrees to each other, and a stop having a normal position between the two arms within said angle to engage one in the direction of its rotation under wind pressure on the wide portion, and to engage the other arm when the wide portion is at trailing position, and means to move the stop to inoperative position.

2,099,618
MACHINE FOR SPREADING AND DISTRIBUTING COAL TO FURNACES
George W. Olney, Minneapolis, Minn.
Application August 2, 1934, Serial No. 738,065
9 Claims. (Cl. 110—115)

1. The combination of a furnace having a fire door opening and a casing having an opening communicating with the fire-door opening of the furnace, a hopper formed in the casing, a bladed rotor journaled in the casing and arranged to receive fuel fed from the hopper and to project it through said openings, means for rotating said rotor, a base plate between the hopper and rotor

adjustable longitudinally of the casing, and means carried by said base plate and adjustable

with it operating to engage and feed fuel from the hopper to the rotor.

2,099,619

SECURING TRIM PANELS

Bion C. Place, Detroit, Mich., assignor of one-half to George E. Gagnier, Detroit, Mich.
Application June 12, 1933, Serial No. 675,512
9 Claims. (Cl. 45—138)

1. A trim panel comprising a foundation provided with an opening, trim material covering one side of said foundation, fastener anchoring means having an imperforate body secured to said foundation so as to substantially lap said foundation at said opening, said means being disposed between said material and foundation with the body thereof extending in said opening, and a fastener interlocked with said means through said opening.

2,099,620

GARMENT

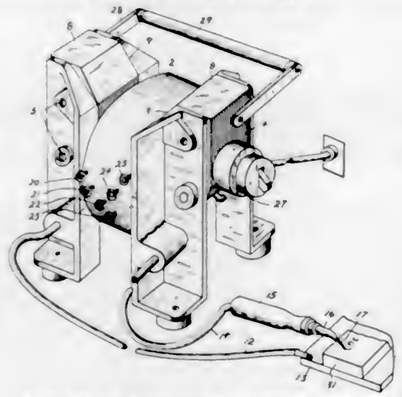
Albert Pleiter and Adolph H. Peterson, Northville, Mich.
Application September 28, 1934, Serial No. 745,992
1 Claim. (Cl. 2—79)

In a sleeveless overall, the combination with a trousers portion having a waist line opening adjacent each side thereof and provided with pockets, means for securing the free edges of the waist line defined by the opening together, of a waist portion adapted to extend over the shoulders and being secured to the front of the trousers portion and having a portion thereof overhanging said trousers portion, the opening of said pockets, and the securing means securing the free edges defined by the waist line opening, the rear end of the waist portion terminating short of the waist line of the trousers portion, said waist portion having an elongated opening located in the upper end thereof and a centrally disposed slit extending from the lower portion of the opening to the lower end of the waist portion dividing said waist portion into sections, means secured to the edges of the sections defined by the slit for securing said sections together, an upstanding back section secured to the rear of the trousers portion terminating short of the rear end of the waist portion and spaced resilient straps connecting the free end portion of the waist and back section.

2,099,621

CONVERTIBLE METALLIC COT

John H. Prescott, Columbus, Ohio
Application March 19, 1936, Serial No. 69,677
2 Claims. (Cl. 5—8)



1. A cot of the class described having a lower mattress supporting frame, an upper mattress supporting frame adapted to assume a superposed position on the lower mattress frame, said frames having vertical flanges, the upper mattress frame having a mattress-supporting flange extending inwardly below the top thereof, pairs of links at the corners of the cot, the links of each pair being pivoted together, said links being of angle form in cross section and each cutaway at one flange thereof to provide extensions pivoted to the frames on the interior thereof, the ends of the cutaway flanges of each link in the unfolded condition of the cot resting on the edges of the vertical flange of the engaged adjacent frame, and means operable to maintain the links against collapse in the unfolded condition.

2,099,622

APPARATUS FOR ELECTRICALLY MARKING METALS

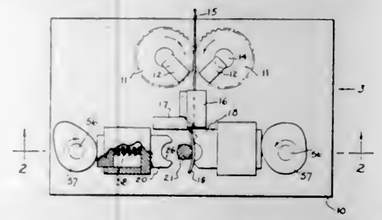
Glenn E. Printz, Detroit, Mich.
Application March 21, 1935, Serial No. 12,161
3 Claims. (Cl. 175—367)

1. A work-holding electro-magnet comprising a magnetizing coil, a magnetizable laminated core within the coil, having a pair of pole pieces at its ends, projecting similarly beyond the coil periphery and having coplanar work-seating faces and also having work-seating faces convergent toward the coil, and a pair of frame members clamping the laminations together, and projecting beyond the coil coextensively with the laminations and having upper end faces approximately flush with the said work-engaging faces.

2,099,623

CUPRIFEROUS FUNGICIDES

Ray Riley, Long Island City, N. Y., and William McAfee Bruce, Mount Holly, N. J., assignors to The Permutit Company, New York, N. Y., a corporation of Delaware
No Drawing. Application November 19, 1935, Serial No. 50,590
12 Claims. (Cl. 167—16)



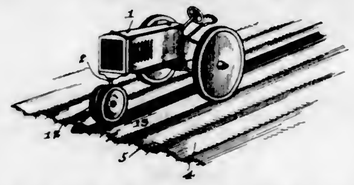
1. In the manufacture of fungicides containing large amounts of copper in a form available for fungicidal purposes but not injurious to vegetation, the process which comprises preparing an aqueous gel of the nature of those used in making base exchanging zeolites by mixing a solution of sodium silicate and a solution of an alumina compound of the class consisting of aluminate and alum, reacting upon said aqueous gel with copper sulfate solution prior to final drying, the amount of copper sulfate being sufficient to furnish CuO to the gelling mixture in more than an equimolecular ratio to the alumina, drying, washing and comminuting to a fine powder suitable for fungicidal purposes.

5. As a new fungicidal composition, a powdered dried zeolitic neutral aluminosilicate gel, containing copper oxid incorporated in the gel structure in a non-exchangeable form fungicidally available and in amount corresponding to a molecular ratio of copper oxid to alumina between 1:1 and about 10:1.

2,099,624

MACHINE FOR SIMULTANEOUSLY FORMING RINGS AND ASSEMBLING THEM ON SHAFTS

George F. Robarge, Toledo, Ohio
Application June 20, 1936, Serial No. 86,261
1 Claim. (Cl. 153—1)

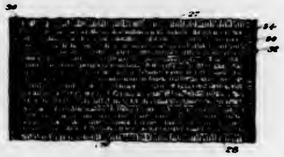


A machine for forming a ring or bushing and assembling it on a shaft or spindle simultaneously comprising a shaft or spindle holder, cutting and forming dies on diametrically opposed sides of the spindle and having adjacent ends shaped to sever a leading part of a ribbon of stock from the remainder of the ribbon to provide a cut piece of stock and to form the cut piece of stock into a ring around the spindle as a mandrel, the cutting and forming operations being performed in the same single stroke of the two dies, and means for moving the dies towards and away from each other and the shaft or spindle.

2,099,625

STEERING WHEEL STRUCTURE

Turney B. Roberts and William A. Howard, Memphis, Tex.; said Howard assignor to Howard S. Randal, Memphis, Tex.
Application June 8, 1937, Serial No. 147,081
5 Claims. (Cl. 280—97)



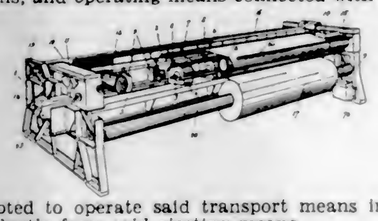
1. In a steering wheel structure for farm tractors, a carrier adapted to be secured to a steering post, a pair of oppositely extending downwardly inclined axles fixed at their inner ends to said carrier, and a pair of inner sidewise opposed oppositely inclined revoluble steering wheels carried by said axles and having the successive lower portions of the faces of the inner sides thereof, during the revolving of the wheels in permanent wedging engagement.

2,099,626

RUG AND METHOD OF MAKING SAME

William W. Robinson, Memphis, Tenn., assignor to McCallum & Robinson, Inc., Memphis, Tenn., a corporation of Tennessee
Application November 19, 1936, Serial No. 111,722
9 Claims. (Cl. 112—1)

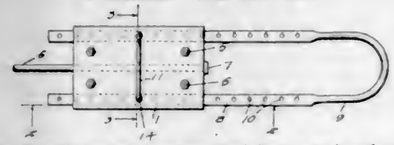
1. A method of making rugs, mats and the like, which consists in extending strands of yarn transversely of a fabric base for substantially the full length thereof, then stitching the yarn transversely to the base by means of central stitching extending longitudinally of the base, then stitching the yarn also to the base by means of stitching extending longitudinally of the base near the side edges of the base, and then stitching the yarn to the base by means of other rows of stitching extending longitudinally of the base between the first mentioned rows, to provide an even tautness of the yarn between the various rows of stitching, and then cutting the yarn intermediate the rows of stitching.



2,099,627

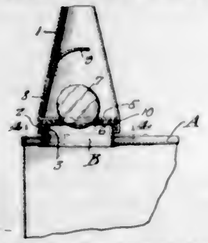
HIGH CAPACITY WEAVING MACHINE

Rudolf Rossmann, Gauting, near Munich, Germany, assignor to Tefag Textil-Finanz A.-G., Zurich, Switzerland
Application July 19, 1934, Serial No. 736,117
In Hungary July 20, 1933
32 Claims. (Cl. 139—125)



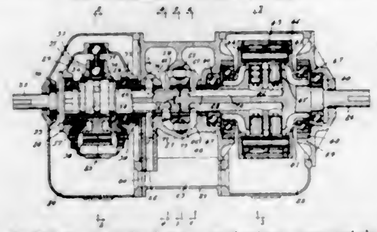
1. In a high capacity machine for weaving having gripping shuttles, the combination of ejecting means adapted to eject said shuttles in a direction across the shed, receiving means adapted to receive said shuttles, movable transport means for carrying and returning said shut-

tles from said receiving means to said ejecting means, and operating means connected with and



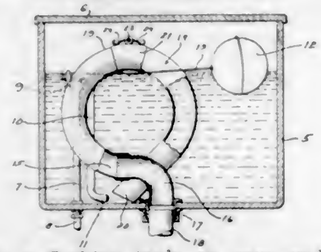
adapted to operate said transport means independently from said ejecting means.

2,099,628
ADJUSTABLE PULL ROD CLAMP
James F. Sampson, Skiatook, Okla.
Application December 7, 1936, Serial No. 114,708
2 Claims. (Cl. 287—58)



1. A pull rod clamp comprising a pair of companion body sections having grooves extending along the longitudinal centers and adjacent to the longitudinal edges thereof, means for securing the sections together with the grooved faces in face to face relation and with a pull rod section clamped between the same in the centrally disposed grooves thereof, a substantially U-shaped member having its arms slidably mounted in the other grooves and the bight portion thereof adapted to have the other pull rod section fixed thereto, said arms having openings extending therethrough and disposed along their length, and a substantially U-shaped latch member removably associated with the body sections for passage therethrough and for disposal in any of the openings of the arms for securing the U-shaped member in adjusted positions with respect to the body sections.

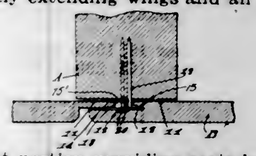
2,099,629
CLOSURE AND POURING DEVICE
Edward G. Schaetzel, Alhambra, Calif.
Application September 8, 1936, Serial No. 99,808
2 Claims. (Cl. 221—18)



1. A closure device for a container comprising a hollow funnel like body tapered inwardly toward one end, means at the opposite end of the body for detachably securing the same to the outlet of the container, sealing means included in the securing means, a disk within said body and having a central opening therein with depressed edges to provide a seat, said opening registering with the outlet for the passage of the contents of the container therethrough, a gravity actuated ball receivable by the seat for closing the opening, and means formed on the disk and rising therefrom for disposal in the path of the ball to limit the open position thereof.

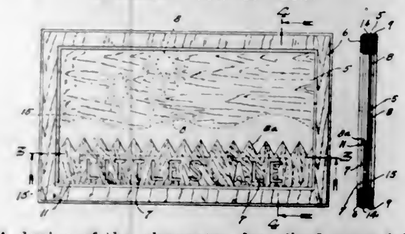
2,099,630
TRANSMISSION
Adolf G. Schneider, Beloit, Wis.
Application March 1, 1933, Serial No. 659,146
38 Claims. (Cl. 60—53)

1. A fluid operated transmission comprising in combination a power operated pump for delivering fluid under pressure and comprising a housing, a motor operable by the fluid and comprising a housing, said pump and motor being in coaxial spaced relation, a central, axial, hollow driven shaft common to the pump and motor and turning with both, a stationary control housing between the pump and motor and joining their housings to form a unitary assembly, said control housing having passages therein, the hollow shaft having longitudinal channels provided therein to conduct all of the moving fluid through the passages in the control housing to and from the pump and motor, and means on the control housing for controlling the flow of fluid through said shaft.



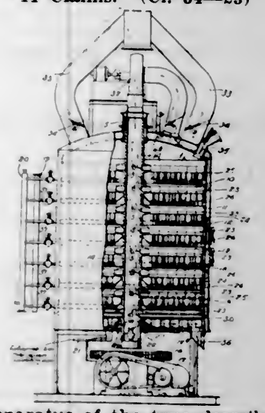
2,099,631
SIPHON FLUSH TANK
Luigi Serra, Washington, D. C., assignor to Serra Ltd., a corporation of New York
Application March 24, 1936, Serial No. 70,645
10 Claims. (Cl. 4—50)

1. In a flushing tank, an open ended normally ring-like siphon member of resilient material, and means for flexing the siphon member inwardly intermediate its ends to establish siphonic flow thru the member.



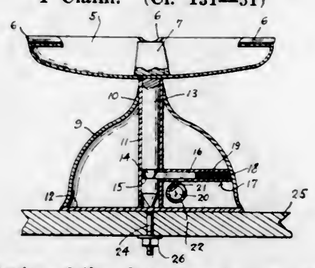
2,099,632
BLIND FASTENER FOR WALL AND CEILING BOARDS
Frederick E. Starr, Belzoni, Miss.
Application September 12, 1936, Serial No. 100,529
6 Claims. (Cl. 20—4)

1. The combination of planking, boarding or other wall or ceiling covering having under and overlapped edge portions, edging tongues on said under and overlap portions, and fasteners having reversely extending wings and an intermedi-



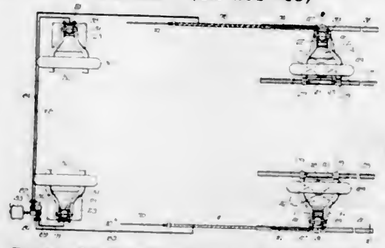
ate straight portion providing seats between the wings for accommodating the edge tongues of adjacent planks when disposed in underlap and overlap relation to each other.

2,099,633
DISPLAY SIGN AND METHOD OF CONSTRUCTION
Robert H. Stewart, Detroit, Mich.
Application December 8, 1936, Serial No. 114,751
1 Claim. (Cl. 40—152)



A device of the character described comprising the combination of a plurality of superimposed laminated layers of naturally grained wood, the grains of the several layers being disposed in different directions, at least one of said layers having different light treating characteristics, and another of said layers having decorative cut-out portions superimposed on said last named layer.

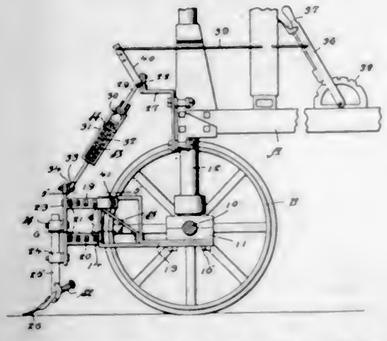
2,099,634
APPARATUS FOR HEAT TREATING GRANULAR FOODS
Gerald Thorp and Ernest Halse, Bethlehem, Pa., assignors to Bethlehem Foundry & Machine Company, Bethlehem, Pa., a corporation of Pennsylvania
Application July 11, 1936, Serial No. 90,215
11 Claims. (Cl. 34—23)



1. In apparatus of the type described, a hollow-walled chamber, a plurality of vertically-spaced hearths in said chamber, means for cooling at least the lowermost of said hearths, means for heating the remainder of said hearths, means for causing material to move successively across said hearths from the upper to the lower end of the chamber, and means to circulate air over said lowermost hearth through the hollow wall of said chamber and then deliver the same to said heated hearths.

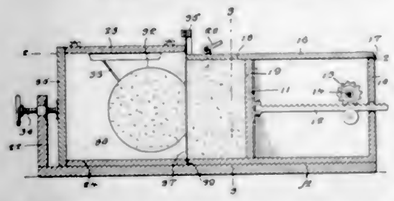
2,099,635
ASHTRAY
Guy Toniolo, Grapeville, Pa.
Application October 2, 1936, Serial No. 103,771
1 Claim. (Cl. 131—51)

In a device of the class described, a casing of substantially conical form providing a base and having an aperture in the apex portion thereof, a sleeve extending from said aperture into the said casing, a bowl having a spindle extending through said aperture into said sleeve and rotatable therein, said spindle having a shoulder thereon, and said sleeve having a radial aperture opposed to said shoulder, and a locking bolt slidably mounted inside the casing to extend through the aperture in said sleeve and to overlie said shoulder, said bolt being tensioned for movement to overlying positions.



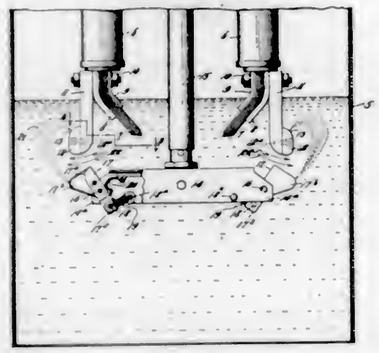
2,099,636
VEHICLE-LIFT
Ira A. Weaver, Springfield, Ill., assignor to I. A. Weaver Engineering Company, Springfield, Ill., a corporation of Illinois
Application December 9, 1935, Serial No. 53,531
9 Claims. (Cl. 254—93)

1. In a vehicle-lift, the combination of a pair of separate and independent lifting-and-lowering means outside of each of the opposite sides of the floor-space to be occupied by the vehicle to be elevated, the bottoms of said lifting-and-lowering means being at substantially floor-level, separate and independent means on each of said lifting-and-lowering means projecting inwardly toward and adapted to engage and to support and to lift and to lower the vehicle, means to operate said lifting-and-lowering means, said separate and independent means being at substantially



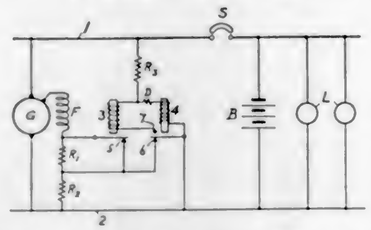
floor-level in their lowest positions and adapted to have the vehicle-wheels driven onto them when in such lowest positions, and turn-tables on those ones of said inwardly-extended means designed to support the front wheels of the vehicle and on which such wheels are adapted to rest to permit easy side turning of such front wheels by their steering-mechanism.

2,099,637
TRACTOR ATTACHMENT
Albert N. Wendel, Meservey, Iowa
Application March 9, 1937, Serial No. 129,886
4 Claims. (Cl. 97—47)



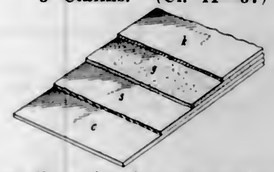
1. An attachment for a tractor having a front steering mechanism comprising a bracket fixed to said mechanism and having an upstanding frame, a carrier head vertically disposed forwardly of said frame and having vertical swinging connection therewith, a ground scraper supported by said head, a hanger fixedly held elevated above said frame, a cranked shaft journaled in said hanger, spring tensioned connections between the head and the crank of said shaft, and means on the tractor for turning said shaft.

2,099,638
MOLDING MACHINE
Joe Wiley, Fresno, Calif.
Application August 3, 1936, Serial No. 94,077
5 Claims. (Cl. 17—32)



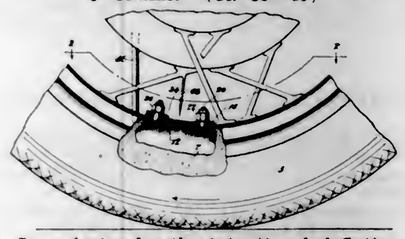
1. A machine of the character described comprising a housing having a feeding chamber, a head slidable in the housing and working through said chamber, rack bars connected with said head, hand driven rack pinions meshing with said rack bars for operating the same, a magazine rack next to the chamber, a magazine carried by said rack, and alternately arranged mold parts and separators removably fitted in the magazine, the mold parts having molding cavities provided with air vents and communicative with the feed chamber.

2,099,639
CIRCUIT BREAKER
Joseph D. Wood, Bethlehem, Pa., assignor to Roller-Smith Company, a corporation of New York
Application November 18, 1935, Serial No. 50,299
5 Claims. (Cl. 200—146)



1. A circuit breaker comprising a movable conducting element, a fixed conducting element, an auxiliary conducting element movable relatively to and carried by said movable conducting element, said auxiliary conducting element having a contacting portion adapted to engage the inner face of the fixed conducting element and having a side portion extending outwardly and embracing a side of said fixed conducting element in the closed position of the breaker, and means for biasing said auxiliary element outwardly to cause said contacting portion to engage the inner face of said fixed conducting element and to cause said side portion to move outwardly relatively to said fixed conducting element upon the opening of the breaker.

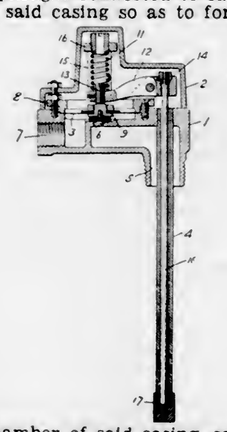
2,099,640
CHARGING-CONTROL SYSTEM
Joseph Lester Woodbridge, Philadelphia, Pa., assignor to The Electric Storage Battery Company, Philadelphia, Pa., a corporation of New Jersey
Application April 18, 1936, Serial No. 75,073
6 Claims. (Cl. 171—314)



1. In combination, a storage battery and its load circuit, a generator provided with means for controlling its output selectively at any one of three values, a voltage-responsive means normally inoperative for reducing the output from the intermediate value to the lowest value, and other voltage-responsive means for reducing the output from the highest to the intermediate value and simultaneously putting the first-mentioned means into operative condition.

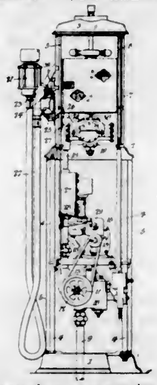
2,099,641
GOLD LEAF SUBSTITUTE
Stefan Bach, Nuremberg, and Konrad Kurz, Furth, Germany
Application November 14, 1933, Serial No. 697,962
In Germany February 6, 1933
5 Claims. (Cl. 41—37)

2. A metallic embossing strip or sheet, comprising a cathodically deposited dense metallic foil of uniform thickness, a support, a releasable layer between said foil and said support, a hard, smooth, transparent layer next to said metallic foil composed of material selected from the group consisting of varnishes and lacquers and a sizing layer on the side of said foil opposite said support.



2,099,642
TIRE DEFLATING DEVICE
Clarence A. Overturf, Detroit, Mich., assignor to American Tire Guard Company, Detroit, Mich., a corporation of Michigan
Application June 24, 1936, Serial No. 87,077
9 Claims. (Cl. 35—49)

1. In a device for the intentional deflation of pneumatic tires while running, a rim for the support of a tire casing and an associated air containing elastic inner tube, said rim being provided with an opening for the passage of an elastic portion of the inner tube, and a movable closure extending over said opening to restrain the adjacent elastic portion of the inner tube and being movable out of restraining relation to the adjacent elastic portion of the inner tube to release the same.



2,099,643
TEMPERATURE AND PRESSURE RELIEF VALVE
Francis W. Werring, Philadelphia, Pa., assignor to Kitson Company, Philadelphia, Pa., a corporation of West Virginia
Application March 23, 1934, Serial No. 717,023
5 Claims. (Cl. 137—139)

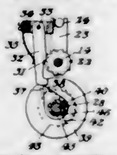
5. A pressure responsive and temperature responsive relief valve device comprising, a casing having an inlet and an outlet, a valve seat interposed between said inlet and said outlet, a movable valve cooperating with said seat, a spring stressing said valve to closed position, a thermostatic element extending into said inlet and connected in operative relation to said valve to move said valve in response to predetermined temperature in said inlet and in opposition to said spring and disconnected from operative relation with said valve upon movement of said valve in response to pressure on said valve, and a flexible diaphragm connected to said valve and to parts of said casing so as to form a flexible

wall in a chamber of said casing, said chamber being sealed from fluid in said casing and containing said spring and at least a portion of said thermostatic element.

2,099,644
LIQUID DISPENSING APPARATUS
Joseph C. Woodford, Haverford, Pa., assignor to John Wood Manufacturing Company, Inc., Conshohocken, Pa., a corporation of Delaware
Application November 22, 1934, Serial No. 754,201
3 Claims. (Cl. 221—95)

1. In liquid dispensing apparatus, the combination with a meter for measuring the volume of liquid dispensed; of a hose; a pump for dispensing liquid through said meter and hose; means for indicating the volume of liquid thus dispensed at each dispensing operation; an electric motor operatively connected with said pump; an electric switch for controlling the operation of said motor and pump; a hose supporting lever connected with said switch; a switch control lever; pivotal connecting means at one end of said switch control lever, adjustable transversely with respect to said lever, by screw means; a link pivotally connected at one end with said hose supporting lever, and pivotally connected at the other end with said transversely adjustable pivotal connecting means on said switch control

lever; whereby the relative positions of said hose support and switch control lever may be precisely adjusted; set back mechanism for restoring said indicating mechanism to zero position, including a set back shaft; a cam rigidly connected with said set back shaft and having a notch in its periphery; a casing inclosing said cam; an automatically operative clutch element interposed between said casing and said shaft limiting the rotation of said shaft to the one direction for setting back said indicating means; a locking lever, fulcrumed in said casing, having at one end a roller in cooperative relation with said cam and having its other end overhanging and limiting the movement of said switch control lever; a spring in said casing continually stressing the end of said locking lever carrying said roller toward said cam, whereby said roller is caused to enter said cam notch when the latter is presented in registry therewith; a latch lever fulcrumed at its upper end in said casing and extending transversely with respect to said switch control lever and locking lever; said latch lever having a projecting knob intermediate of its length for cooperation with said switch control lever; and a snap spring extending from the free end of said latch lever across the fulcrum of said latch lever to a point of attachment in said casing; whereby said snap spring holds said latch lever alternately at either extreme of its range of movement, and said switch control lever is only freed from said locking lever when said roller is permitted to enter the notch of said cam by set back movement of said cam to zero position of said indicating means and the consequent movement of said locking lever presses said latch lever out of engagement with said switch control lever.



2,099,645

REGISTER TRANSFER MECHANISM

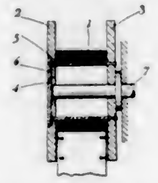
Joseph C. Woodford, Haverford, Pa., assignor to John Wood Manufacturing Company, Inc., Conshohocken, Pa., a corporation of Delaware

Original application October 31, 1934, Serial No. 750,805. Divided and this application April 22, 1935, Serial No. 17,691

1 Claim. (Cl. 235—133)

In a tens-transfer mechanism; the combination with two rotary members respectively of a higher and lower decimal order, of means for effecting a rotary movement of the member of the higher order by each complete rotation of the member of the lower order, including a spring, continually stressing said member of the higher order to advance it; means for controlling the advancement of said member of the higher order, including an axial shaft in rigid relation therewith, a ratchet wheel in rigid relation with said shaft, two pawls, of respectively different length, for engaging said wheel in circumferentially spaced relation thereto; means for effecting escapement of said wheel from one tooth to the next with respect to said pawls, including two rotary tappet cams in circumferentially spaced relation; means for revolving said tappet cams; and means operatively connecting said cams with said member of the lower order to automatically trip said pawls at each rotation of the latter member; whereby said pawls are successively tripped by said cams, and successively engage each tooth of said wheel, and limit each movement of said rotary member of the higher order to the angle between adjoining teeth of said wheel.

2,099,646



ROLL CARRIER FOR PHOTOGRAPHIC STRIP FILM

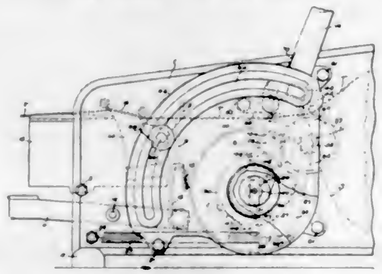
Leo Busch, Berlin-Karlshorst, Germany

Application July 17, 1935, Serial No. 31,841

In Germany October 24, 1934

5 Claims. (Cl. 242—71)

2. In a roll carrier for photographic film, the combination with a carrier for photographic strip film including apertures on both sides spaced a predetermined distance, of a spindle adapted to enter either aperture but of insufficient length to project through both apertures, a frangible seal covering at least one aperture, whereby the condition of the seal may indicate the direction in which the carrier has been placed on said shaft.



2,099,647

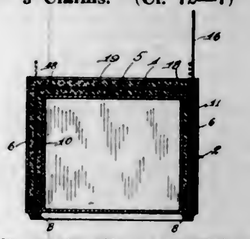
PLURAL-LENGTH TAPE DISPENSING MEANS

Trevor R. Gautier, Nashua, N. H., assignor to Nashua Gummed and Coated Paper Company, Nashua, N. H., a corporation of Massachusetts

Application May 21, 1936, Serial No. 81,001

14 Claims. (Cl. 271—2.4)

1. In a hand-operated machine for dispensing dry-gummed tape, in combination, a frame, a support thereon for a supply of dry-gummed tape, opposed rolls for advancing the tape for moistening and severance, a rock shaft and means to return it to an initial angular position, one-way drive and gearing connections between the shaft and one of the feed rolls, a plurality of independent hand levers having each an operating and a return movement, said levers operatively associated with the shaft to turn it in one direction thereby selectively to feed tape lengths corresponding to the extent of the operating movement of the selected lever, and positive means to limit the lever movements.



2,099,648

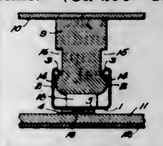
VAULT CONSTRUCTION

Arthur C. Griffith, Chicago, Ill., assignor to United States Gypsum Company, Chicago, Ill., a corporation of Illinois

Application February 16, 1935, Serial No. 6,801

3 Claims. (Cl. 72—7)

3. A vault construction comprising a box-like structure having bottom and side walls, said side walls being of reinforced concrete and being relatively thin and wide, said reinforcing comprising a sheet of flat expanded metal having flat strands and flat bonds lying substantially in a common plane, said sheet extending substantially from top to bottom of a wall and having a free edge extending along and adjacent the line of juncture of the bottom with said wall, said sheet being spaced a substantial distance from the inside and outside surfaces of the wall, said concrete mixture being forced into the meshes of the expanded metal by pressure exerted on both sides of the flat expanded metal by means of a tool.



2,099,649

CEILING INSTALLATION AND FASTENER FOR THE SAME

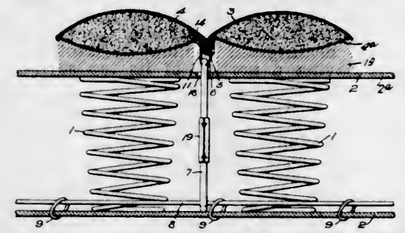
Charles L. Hall, Detroit, Mich., assignor to United-Carr Fastener Corporation, Cambridge, Mass., a corporation of Massachusetts

Application March 17, 1934, Serial No. 716,163

6 Claims. (Cl. 296—137)

1. A fastener structure of the class described including an attaching plate having a raised portion provided with an aperture therethrough, a snap fastener stud member having a base provided with hook-like projections of unequal length to permit insertion through the aperture by a relative tipping action and to engage beneath the raised portion, said hook-like projections and the raised portion of said attaching plate being shaped and arranged to prevent relative rotation and stud means for snap fastening engagement with a cooperating stud-receiving means, said stud means extending from the opposite side of said base from said hook-like projections.

2,099,650



CUSHION TUFTING STRUCTURE

Charles L. Hall, Detroit, Mich., assignor to United-Carr Fastener Corporation, Cambridge, Mass., a corporation of Massachusetts

Application March 28, 1934, Serial No. 717,828

6 Claims. (Cl. 155—185)

6. In a cushion construction, spaced frame structures, spring means positioned between said frame structures, a padded cushion member on the outside of one of said frame structures, said cushion member having a covering having a fold extending downwardly, a plurality of individual tufting devices secured to the fold of the covering and having spaced means bearing against opposed sides of said fold, means connecting said spaced bearing means, each of said tufting devices being completely concealed by the covering, and tie means connecting the tufting devices to the other frame structure to hold the fold under tension.

2,099,651

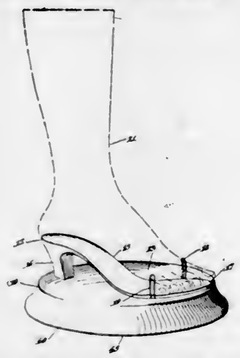
PLASTIC MATERIAL AND METHOD OF PRODUCING THE SAME

Ernst Helft, Berlin-Halensee, Germany, assignor, by mesne assignments, to "Unichem" Chemikalien Handels A.-G., Zurich, Switzerland, a corporation of Switzerland

No Drawing. Application December 30, 1933, Serial No. 704,754. In Germany December 31, 1932

19 Claims. (Cl. 106—23)

17. A plastic mass comprising, in combination, a caoutchouc base material, insoluble pulverulent or granular addition material and, as a dispersing agent, a derivative of a high molecular alcohol consisting of an ester of a primary straight chain aliphatic alcohol having 8 to 30 carbon atoms in the molecule with a primary straight chain aliphatic acid having 1 to 30 carbon atoms in the molecule.



2,099,652

SUPPORT FOR HOSIERY DISPLAY FORMS

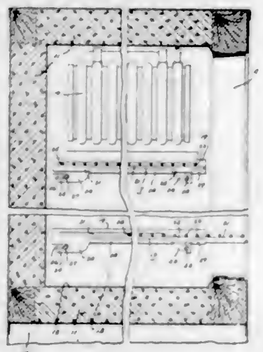
Henry Janssen, Wyomissing, Pa., assignor to Textile Machine Works, Wyomissing, Pa., a corporation of Pennsylvania

Application September 12, 1936, Serial No. 100,458

1 Claim. (Cl. 223—120)

A composite display base for a stocking form comprising a component member substantially

conforming to the bottom of a shoe having a top surface seat simulating the under surface of a foot, a heel portion having a vertical tapped bore portion accessible from the underside of the heel portion, an arch, a sole portion and a downward extension of the sole portion having a vertical tapped bore portion accessible from the underside of the extension, and a separate component support member for the shoe-conforming member of inverted shallow substantially dish shape having a portion of its top surface depressed to receive the downward sole extension, vertically apertured portions for register with said tapped bore portions, screws in said apertured and tapped bore portions for holding the component base members together, insert elements cast into underside portions of the support member, and wire-like clips of inverted substantially U-shape having upper portions bowed toward each other from opposite sides of the sole portion for holding the stocking form in position, and having lower ends extending downwardly through the upper portion of the support member into said insert elements and secured to the latter.



2,099,653

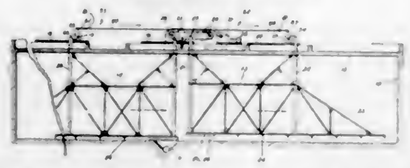
REFRIGERATING APPARATUS

Richard D. Kneisley, Dayton, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Ohio

Application March 29, 1935, Serial No. 13,724

2 Claims. (Cl. 211—143)

1. In a slidable shelf unit adapted to be mounted in the food storage compartment of a refrigerator cabinet comprising in combination, sheet metal guide members adapted to be disposed in substantially the same horizontal plane for extension along opposed side walls of the food compartment, means for detachably mounting said guide members against movement relative to said compartment walls, said sheet metal guide members each including a horizontally extended track portion adapted to support a shelf thereon and an integral upwardly disposed portion having an elongated horizontally extending opening therein adapted to receive a part of the shelf for retaining same on the guide members, a shelf having its side edges carried by said shelf supporting track portion of said guide members and having a part thereof projecting outwardly beyond each of its side edges into the elongated opening in said guide members, said shelf having a reticulated food supporting area between its side edges and being slidable relative to said guide members outwardly of the food compartment of the refrigerator cabinet, said projecting parts of said shelf being adapted to engage the upper wall of the elongated opening in said guide members and cooperating with said shelf supporting track portion thereof to prevent tilting of the shelf when same is slid outwardly of the food storage compartment, and said projecting parts of said shelf being adapted to engage the wall of the forward end of the elongated opening in said guide members for limiting movement of the shelf outwardly of the food compartment.



2,099,654

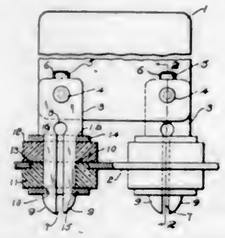
SEDIMENTATION APPARATUS

Nels B. Lund, Seaford, N. Y., assignor to The Dorr Company, Inc., New York, N. Y., a corporation of Delaware

Application April 12, 1933, Serial No. 665,658

16 Claims. (Cl. 210—3)

1. In combination with a sedimentation tank having a sludge outlet located in the central portion thereof, a sludge collecting mechanism comprising a pair of rake members arranged end by end, each rake member adapted to reciprocate as a whole in cyclic movement for intermittent conveyance of the sludge from one end of the tank towards said sludge outlet, and rake actuating mechanism comprising means for imparting positive uniform cyclic motion to the rake members, said actuating mechanism comprising a double armed lever having a longitudinally movable fulcrum point, each arm of said lever adapted to have suspended therefrom an inner adjoining end of a rake, driving means engaging upon one end of said lever and adapted to control bodily as well as rotary movement of said lever in a manner to produce a desired cyclic head motion of the rakes corresponding to said cyclic movement thereof, and comprising operating connections to impart vertical component movement to the outer rake ends corresponding to said head motion.



2,099,655

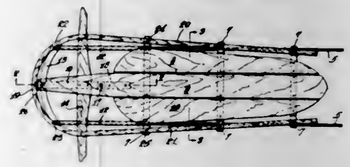
MOUNTING BRACKET AND INSTALLATION THEREOF

Wilford C. MacFadden, Philadelphia, Pa., assignor to United-Carr Fastener Corporation, Cambridge, Mass., a corporation of Massachusetts

Application March 20, 1935, Serial No. 12,114

7 Claims. (Cl. 248—358)

6. The combination with an apertured support of an electrical part of the class described, and a one-piece snap fastening bracket securing said part to said support, a rivet or the like for securing one portion of the bracket to said electrical part, another portion of said bracket being divided into expansible and contractible fingers adapted to engage the aperture of said support with a snap fastener action and to be detached therefrom by an axial pull, said fingers being formed on their outer edges with notches to engage said support, thereby securing said unit in detachable engagement from said support.



2,099,656

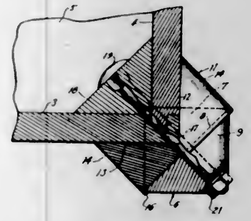
COASTER SLED

Charles Herbert Maneval, Duncannon, Pa., assignor to Standard Novelty Works, Duncannon, Pa., a corporation of Pennsylvania

Application January 16, 1937, Serial No. 120,890

4 Claims. (Cl. 280—22)

1. A hand sled having a resilient wooden front fender, the ends of the front fender being continued integrally to form resilient side fenders for the sled, the portion of the fender at the front at each side being curved where the side fenders and front fenders merge, whereas the resilience of the fenders causes it to yield to impact on the fender and subsequently to resume its shape.



2,099,657

TABLE LEG CONSTRUCTION

Bert E. Mills, Oak Park, Ill., assignor to Mills Novelty Co., Chicago, Ill., a corporation of Illinois

Application September 9, 1935, Serial No. 39,744

7 Claims. (Cl. 311—113)

2. A table leg and attaching means therefor comprising a leg member cut to provide a horizontal shoulder upon which a corner of the table may rest and a vertical attaching portion having a bearing surface facing the exterior of the corner of the table, a bearing member interposed between said attaching portion of the leg and the corner of the table and resting upon said shoulder, opposite sides of said member being shaped to conform to the table corner and the bearing surface of said attaching portion respectively, and means for clamping said bearing member and attaching portion to the corner of the table.

2,099,658

PREPARATION OF CHROMIC ACID AND SPARINGLY SOLUBLE CHROMATES

Richard Edgar Pearson and Walter Villa Gilbert, London, England; said Pearson assignor to said Gilbert

No Drawing. Application November 2, 1934, Serial No. 751,266. In Great Britain November 9, 1933

6 Claims. (Cl. 204—9)

1. A process for preparing compounds of chromium which comprises in combination the following steps in the order named:—

(*a*) Submitting to electrolysis an aqueous solution of an alkali bichromate without the addition of salts of other acids, using a chromium containing anode,

(*b*) Submitting the chromic acid liquor from (*a*) to further electrolysis in a cell provided with a porous partition between the anode and the cathode, using pure chromium as the anode, and

(*c*) Separating the anode liquor before substantial diffusion therein of the solution in the neighborhood of the cathode.

6. A process for preparing metallic chromate by electrolysis of an alkali bichromate solution without the addition of salts of other acids, characterized by selecting as anode a metal which dissolves under anodic action and separating the solution in the neighborhood of the anode from that in the neighborhood of the cathode by a porous partition, the cathode and anode being of the same metal, and precipitating the chromate in the anode solution simultaneously with the production of fresh anode liquor by transferring the cathode to the anode compartment and the anode to the cathode compartment and continuing the electrolysis.

2,099,659

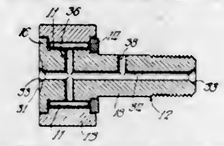
STERILIZATION OF LYOPHILIC BIOLOGICALLY ACTIVE SUBSTANCES

John Reichel, Philadelphia, Pa., assignor to Sharp & Dohme, Incorporated, Philadelphia, Pa., a corporation of Maryland

No Drawing. Application March 16, 1937, Serial No. 131,259

8 Claims. (Cl. 167—78)

1. The improvement in the production of solid lyophilic biologically active substances by rapid freezing of liquid biologically active substances and the removal of water therefrom while in a solid frozen state under a high vacuum, which comprises adding to the liquid biologically active substance, shortly before it is subjected to such treatment, a small amount of an organic mercurial having one bond of the mercury linked directly to a carbon of a benzene ring structure.



2,099,660

BEARING

Thomas L. Robinson, Valparaiso, Ind., assignor to McGill Manufacturing Company, Valparaiso, Ind., a corporation of Indiana

Application November 21, 1936, Serial No. 112,064

2 Claims. (Cl. 74—569)

1. A cam follower including a stud having as integral portions a circular head plate, a hub

portion, and a threaded shank portion; a roller ring carried by said hub portion and rotatable with respect thereto having a counterbore at each side thereof with said head-plate in one of said counter-bores, a spacing and retaining collar frictionally and rigidly secured on said shank substantially at the juncture of the hub portion and shank portion of said stud and lying in the other of said counter-bores, with said collar wider than said other counter-bore, and roller bearings between said hub portion and said roller retained against movement axially of said follower by said stud head plate and said retaining collar.

2,099,661

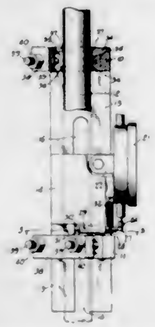
STRIP BEARING

Robert E. Brunswick Sharp, Philadelphia, Pa., assignor to Baldwin-Southwark Corporation, a corporation of Delaware

Application April 12, 1934, Serial No. 720,196

8 Claims. (Cl. 308—239)

1. A bearing comprising a supporting housing having a curved wall, a plurality of strip bearings supported against said wall in partial spaced relation thereto, and means including a complementary projection and recess operatively associated with adjacent bearing strips for interlocking said bearing strips and for allowing the same to be adapted for use in bearings of different diameters while still retaining a normal operative relation to its supporting wall and between the strips.



2,099,662

DYNAMOMETER

John C. Slonneger, Milwaukee, Wis., assignor to The Falk Corporation, Milwaukee, Wis., a corporation of Wisconsin

Application April 13, 1935, Serial No. 16,181

5 Claims. (Cl. 265—1)

2. A dynamometer for measuring stresses in a rod-like member, said dynamometer comprising a pair of spaced clamps for application to said member, a connection between said clamps adjustable to determine the initial spacing thereof and releasable to permit relative movement between said clamps in response to stress changes in said member, means responsive to relative movement between said clamps for indicating the magnitude of stress changes in said member, and a carrier for said means adjustably mounted on said connection to render said means effective in the various spaced positions of said clamps.

2,099,663

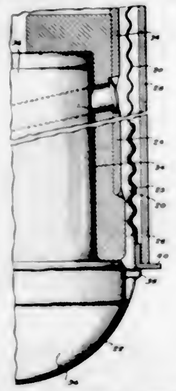
HANDBAG STRUCTURE

Preston Upham, Brookline, Mass., assignor to United-Carr Fastener Corporation, Cambridge, Mass., a corporation of Massachusetts

Application May 10, 1935, Serial No. 20,742

2 Claims. (Cl. 150—29)

1. A handbag frame having a pair of frame members of channel-shaped cross-section formed with bottom and side walls, a hinge construction for each end of the frame, each hinge construction comprising a flat ear formed as an extension of the channel bottom of one frame member at the end thereof and constituting the sole hinge element for that frame member, a hollow bearing formed as an extension of one of the side walls of the other frame member and constituting the sole hinge element for that frame member, and a hinge pin passing through said ear and bearing and securing them in pivotally assembled relation.



2,099,664

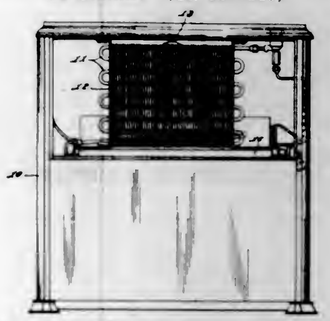
APPARATUS FOR DRIVING PILE SHELLS

Elihu D. Watt, Plainfield, N. J., assignor to Raymond Concrete Pile Company, New York, N. Y., a corporation of New Jersey

Original application April 5, 1933, Serial No. 664,517. Divided and this application July 2, 1935, Serial No. 29,509

7 Claims. (Cl. 61—57)

1. A device of the class described comprising a pile shell, a boot permanently attached to the lower end of said shell and adapted to receive a drive core in shell driving relation, means engaging the boot adapted to support a casing surrounding said shell and to engage the ground as well as the boot for preventing said boot and shell from rising during the withdrawal of the core and casing after said shell has been sunk into the ground.



2,099,665

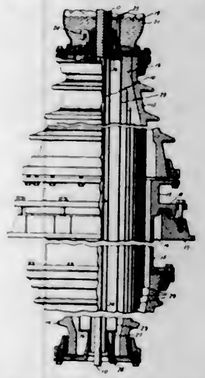
DEHUMIDIFIER

Russell T. Smith, Indianapolis, Ind., assignor to Climax Machinery Company, Indianapolis, Ind., a corporation of Indiana

Application March 1, 1937, Serial No. 128,523

11 Claims. (Cl. 62—140)

2. In a device for conditioning air, a cooling unit comprising a conduit for refrigerant and a series of fins disposed in substantially parallel vertical planes and in intimate contact with said conduit, means for directing over said cooling unit a stream of air to be conditioned, and means for circulating a fluid refrigerating medium through said conduit at a rate to effect condensation of moisture from such air stream upon said fins without causing freezing thereof, adjacent fins of the series being spaced apart at least approximately 0.0505 inch but not more than 0.113 inch.



2,099,666

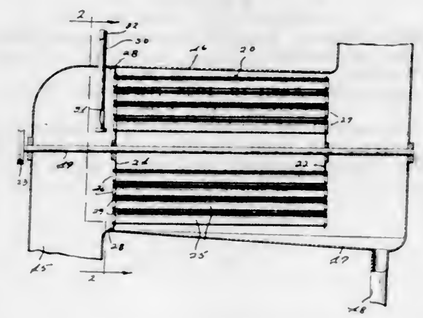
HIGH VOLTAGE LIQUID-FILLED BUSHING

Stephen Terpak, Pittsfield, Mass., assignor to General Electric Company, a corporation of New York

Application June 30, 1937, Serial No. 151,187

4 Claims. (Cl. 173—318)

1. A high voltage bushing including a casing surrounding a conductor, an expansion chamber at one end of the casing, an insulating liquid in the casing and extending into and partly filling the expansion chamber, an expansion chamber within said casing and communicating with the space above the liquid in the other expansion chamber, and a gas in said expansion chambers, said expansion chambers being sealed from the outside air.



2,099,667

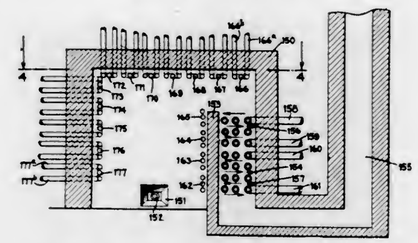
GAS TREATING APPARATUS

Curtis L. Howse, Willis P. Thomas, and Frank Bowers, Detroit, Mich., assignors to Diamond Power Specialty Corporation, Detroit, Mich., a corporation of Michigan

Application May 24, 1934, Serial No. 727,328

18 Claims. (Cl. 261—90)

1. In combination, a gas passage, means for moving a plurality of rundles through said passage so that the gas flowing through said passage must contact portions of the surfaces of said rundles, fluid spraying means for coating the surfaces of said rundles which are contacted by the gas with a dust-collecting fluid and additional fluid spraying means for flushing the coated surfaces of said rundles to clean the same.



2,099,668

METHOD FOR CRACKING OILS IN THE VAPOR PHASE

Percy C. Keith, Jr., Peapack, N. J., assignor to Gasoline Products Company, Inc., Newark, N. J., a corporation of Delaware

Original application November 9, 1933, Serial No. 697,283, which in turn is a division of Serial No. 323,005, December 1, 1928. Divided and this application December 6, 1935, Serial No. 53,143

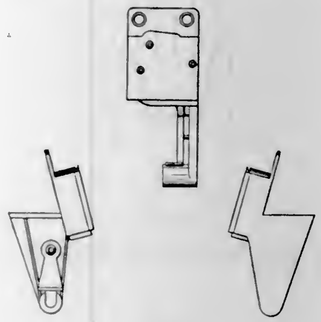
2 Claims. (Cl. 196—47)

1. In the conversion of hydrocarbon oils, the process that comprises passing relatively heavy charging stock in a stream of restricted cross-sectional area through a heating zone and heating said stream with hot combustion gases substantially only by convection heat and then separating the resulting stream into vapors and unvaporized oil, fractionating said vapors to form a plurality of condensates, separately heating said condensates in independent streams of restricted cross-sectional area at a relatively high rate of heat transfer substantially only by radiant heat to rapidly raise the said condensates to desired

cracking temperatures, burning fuel to supply radiant heat to said condensate streams and passing the combustion gases formed, substantially unobstructed by said condensate streams, to said heating zone and thereby supplying convective heat thereto.

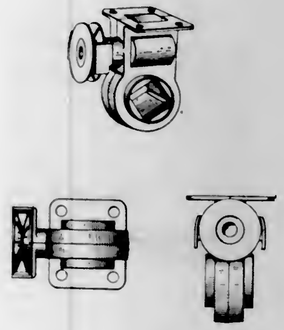
2,099,669
INSULATED COVER
Ralph L. Bangs, Wakefield, and William A. Hermanson, Brighton, Mass., assignors to Forest Wadding Company, Boston, Mass.
Application April 19, 1935, Serial No. 17,212
5 Claims. (Cl. 229—53)

1. An article of the kind described, comprising a water-proof hood, having normally two flat sides adhered together, with edges joined forming a cover with an open bottom and an insulating liner comprising a sheet folded above itself,



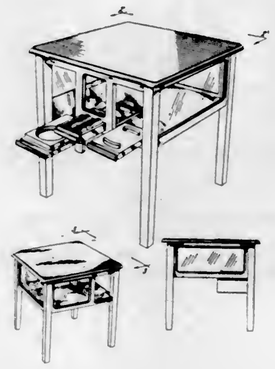
and having its edges come together at the top of the cover, said liner being filled with an insulating material.

DESIGNS



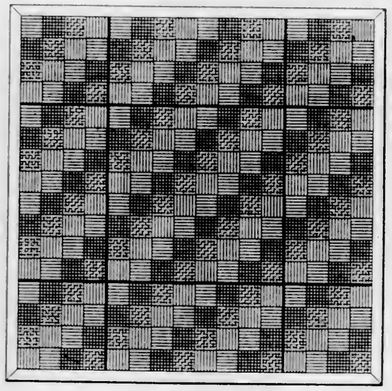
NOVEMBER 16, 1937

106,955
DESIGN FOR A COMBINATION BEARING SUPPORT, RETAINER, AND STOP ATTACHMENT FOR VENETIAN BLINDS
Edwin Anderson, Los Angeles, Calif., assignor to Anderson Die Casting and Engineering Corporation, Los Angeles, Calif., a corporation of California
Application May 11, 1937, Serial No. 69,300
Term of patent 14 years



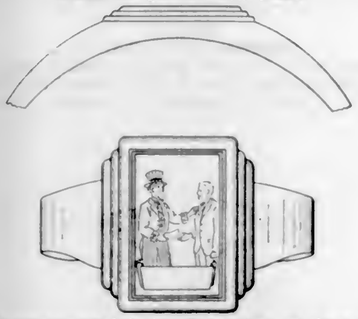
The ornamental design for a combination bearing support, retainer, and stop attachment for Venetian blinds, as shown.

106,956
DESIGN FOR A VENETIAN BLIND TILTING DEVICE
Edwin Anderson, Los Angeles, Calif., assignor to Anderson Die Casting and Engineering Corporation, Los Angeles, Calif., a corporation of California
Application May 11, 1937, Serial No. 69,301
Term of patent 14 years



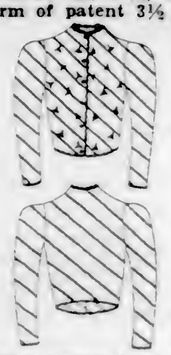
The ornamental design for a Venetian blind tilting device, as shown and described.

106,957
DESIGN FOR A TABLE
Archie H. Bechtol, Daytona Beach, Fla.
Application September 20, 1937, Serial No. 71,692
Term of patent 3½ years



The ornamental design for a table, as shown.

106,958
DESIGN FOR A GAME BOARD
Morris A. Bell, Oshkosh, Wis.
Application February 25, 1937, Serial No. 67,850
Term of patent 7 years

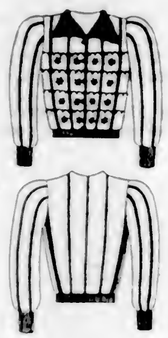


The ornamental design for a game board, as shown and described.

106,959
DESIGN FOR A RING
Richard J. Blooston and Thomas K. Kelly, Jr., Minneapolis, Minn.
Application April 29, 1937, Serial No. 69,048
Term of patent 3½ years

The ornamental design for a ring, as shown and described.

106,960
DESIGN FOR A SWEATER
Hans Boepple, New York, N. Y.
Application October 16, 1937, Serial No. 72,228
Term of patent 3½ years



The ornamental design for a sweater substantially as shown.

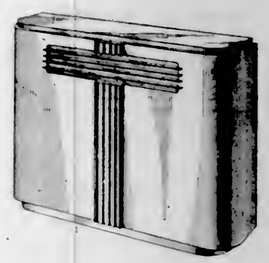
106,961
DESIGN FOR A SWEATER
Hans Boepple, New York, N. Y.
Application October 16, 1937, Serial No. 72,229
Term of patent 3½ years

The ornamental design for a sweater substantially as shown.

106,962
DESIGN FOR A SWEATER
Hans Boepple, New York, N. Y.
Application October 16, 1937, Serial No. 72,230
Term of patent 3½ years

The ornamental design for a sweater substantially as shown.

106,963
DESIGN FOR A NECKLACE OR ANALOGOUS ARTICLE
Alice Spalding Bowen, Honolulu, Territory of Hawaii, and Truman Bailey, San Francisco, Calif., assignors to S. & G. Gump Co., a corporation of California
Application July 6, 1937, Serial No. 70,280
Term of patent 14 years

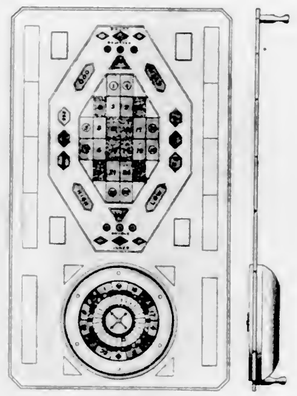


The ornamental design for a necklace or analogous article substantially as shown and described.

106,964
DESIGN FOR A NECKLACE OR ANALOGOUS ARTICLE
Alice Spalding Bowen, Honolulu, Territory of Hawaii, and Truman Bailey, San Francisco, Calif., assignors to S. & G. Gump Co., a corporation of California
Application July 6, 1937, Serial No. 70,281
Term of patent 14 years

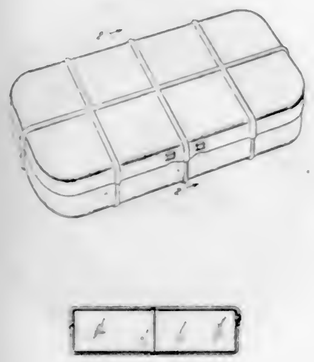
The ornamental design for a necklace or analogous article substantially as shown and described.

106,965
DESIGN FOR A CIRCULATING GAS HEATER
William T. Bradbury, Palo Alto, Calif., assignor to James Graham Manufacturing Co., San Francisco, Calif., a corporation of California
Application September 8, 1937, Serial No. 71,505
Term of patent 7 years



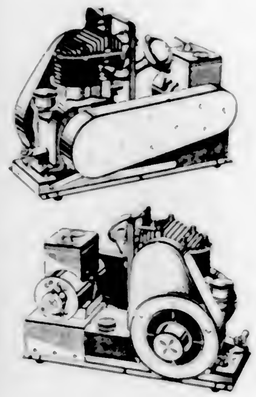
The ornamental design for a circulating gas heater, as shown and described.

106,966
DESIGN FOR A PLATE OR SIMILAR ARTICLE
Alexander Crane, Cheshire, Conn.
Application October 1, 1937, Serial No. 71,917
Term of patent 14 years



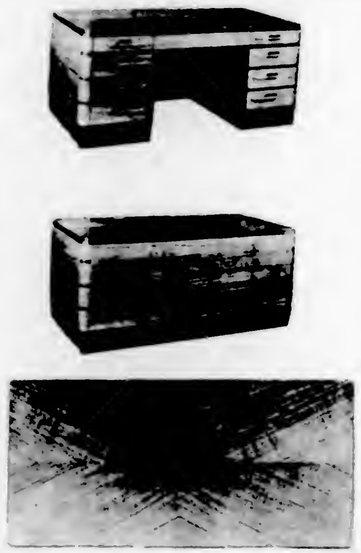
The ornamental design for a plate or similar article, as shown, and described.

106,967
DESIGN FOR A COMBINATION GAME BOARD AND APPARATUS OR SIMILAR ARTICLE
Richard W. Danon, Chicago, Ill.
Application February 25, 1937, Serial No. 67,849
Term of patent 7 years



The ornamental design for a combination game board and apparatus or similar article, substantially as shown.

106,968
DESIGN FOR A BOX OR SIMILAR ARTICLE
William J. De Witt, Auburn, N. Y.
Application March 20, 1937, Serial No. 68,296
Term of patent 14 years

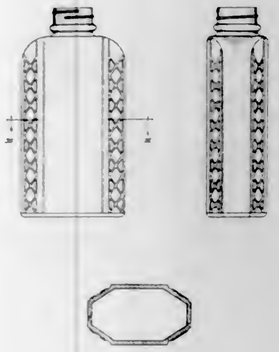


The ornamental design for a box or similar article substantially as shown.

106,969
DESIGN FOR A PORTABLE POWER UNIT
John W. Fitz Gerald, Milwaukee, Wis., assignor to Briggs & Stratton Corporation, Milwaukee, Wis., a corporation of Delaware
Application April 5, 1937, Serial No. 68,558
Term of patent 14 years

The ornamental design for a portable power unit, as shown.

106,970
DESIGN FOR A DESK
Paul M. Fuller, Chicago, Ill., assignor to Clemco Desk Mfg. Co., Chicago, Ill., a corporation of Illinois
Application January 30, 1937, Serial No. 67,355
Term of patent 7 years



The ornamental design for a desk substantially as shown.

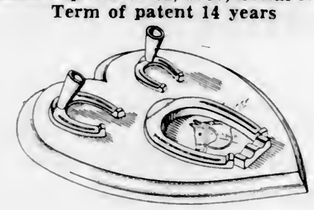
106,971
DESIGN FOR A BOWL OR SIMILAR ARTICLE OF HOLLOW WARE
George Thornton Gilby, Brighton, England, assignor to The Wallingford Company, Incorporated, Wallingford, Conn., a corporation of Connecticut
Application September 22, 1937, Serial No. 71,718
Term of patent 14 years

The ornamental design for a bowl or similar article of hollow ware substantially as shown and described.

106,972
DESIGN FOR A GLASS BOTTLE
James Telford Hamilton, Pittsburgh, Pa., assignor to J. T. & A. Hamilton Company, a corporation of Pennsylvania
Application October 1, 1937, Serial No. 71,916
Term of patent 14 years

The ornamental design for a glass bottle substantially as shown.

106,973
DESIGN FOR A TUMBLER
Melvin O. Hansen, Toledo, Ohio, assignor to Libbey Glass Company, Toledo, Ohio, a corporation of Ohio
Application April 14, 1937, Serial No. 68,750
Term of patent 7 years

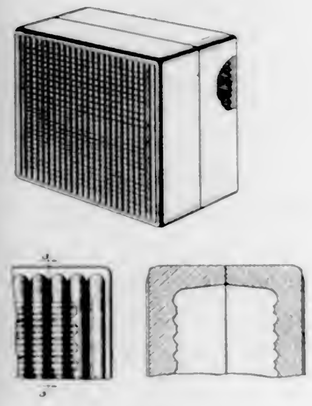


The ornamental design for a tumbler substantially as shown.

106,974
DESIGN FOR A PLAQUE
Hugo Heizmann, Boston, Mass.
Application September 21, 1937, Serial No. 71,710
Term of patent 14 years

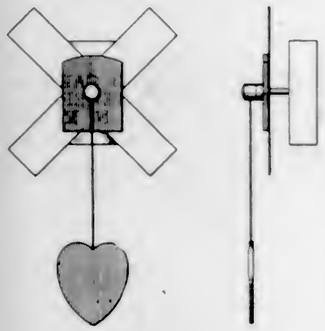
The ornamental design for a plaque as shown.

106,975
DESIGN FOR A COMBINATION PENCIL STAND AND ASHTRAY
Hugo Heizmann, Boston, Mass.
Application September 21, 1937, Serial No. 71,711
Term of patent 14 years



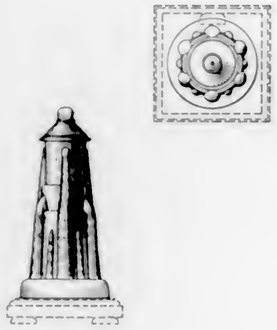
The ornamental design for a combination pencil stand and ashtray as shown.

106,976
DESIGN FOR A COMBINED CAKE OF SOAP AND SUPPORT THEREFOR
Lynde De F. Hokerk, Utica, N. Y., assignor to Kerk Guild, Inc., Whitesboro, N. Y., a corporation of New York
Application April 22, 1937, Serial No. 68,940
Term of patent 14 years



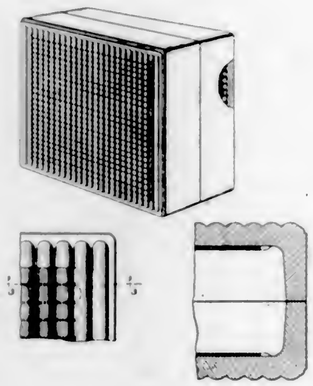
The ornamental design for a combined cake of soap and support therefor, as shown and described.

106,977
DESIGN FOR A HOLLOW GLASS BUILDING BLOCK
Minot K. Holmes, Muncie, Ind., assignor to Owens-Illinois Glass Company, Toledo, Ohio, a corporation of Ohio
Application September 30, 1937, Serial No. 71,899
Term of patent 14 years



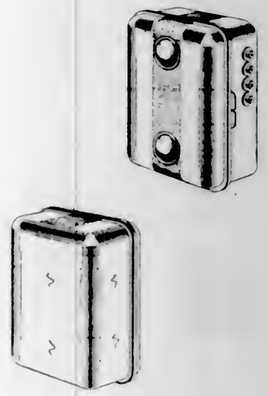
The ornamental design for a hollow glass building block substantially as shown and described.

106,978
DESIGN FOR AN INDICATING NOVELTY FOR A TOILET DOOR
Daniel Paul Iddings, San Francisco, Calif.
Application July 6, 1937, Serial No. 70,269
Term of patent 14 years



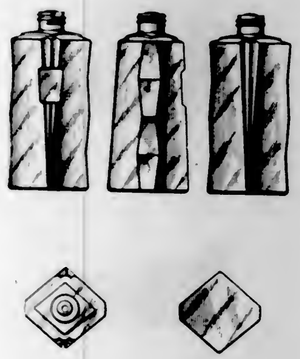
The ornamental design for an indicating novelty for a toilet door, substantially as shown.

106,979
DESIGN FOR A DISPENSER CASING OR SIMILAR ARTICLE
Gustav F. Ingwersen, Denver, Colo.
Application April 2, 1937, Serial No. 68,517
Term of patent 7 years



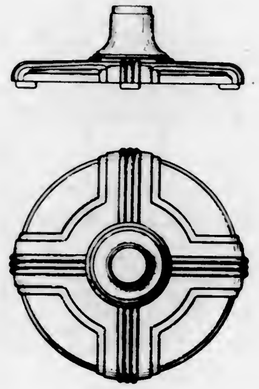
The ornamental design for a dispenser casing or similar article, as shown.

106,980
DESIGN FOR A HOLLOW GLASS BUILDING BLOCK
David Jones, Muncie, Ind., assignor to Owens-Illinois Glass Company, Toledo, Ohio, a corporation of Ohio
Application September 30, 1937, Serial No. 71,904
Term of patent 14 years



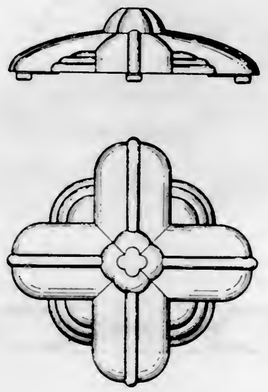
The ornamental design for a hollow glass building block, substantially as shown and described.

106,981
DESIGN FOR AN ELECTRIC FENCE CONTROLLER CABINET
Daniel Allcott Kelly, Milwaukee, Wis., assignor to The Prime Manufacturing Company, Milwaukee, Wis., a corporation of Wisconsin
Application August 28, 1937, Serial No. 71,374
Term of patent 14 years



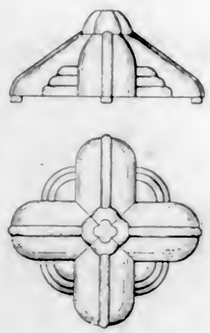
The ornamental design for an electric fence controller cabinet, as shown and described.

106,982
DESIGN FOR A BOTTLE
William Richard Kohl, Cumberland, Md., assignor to Carr-Lowrey Glass Co., Baltimore, Md.
Application October 2, 1937, Serial No. 71,933
Term of patent 14 years



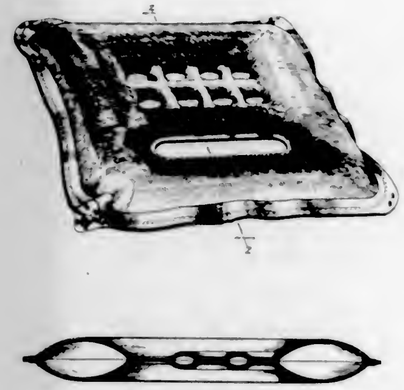
The ornamental design for a bottle, as shown.

106,983
DESIGN FOR A BASE FOR ELECTRIC FANS OR THE LIKE
Ralph E. Kruck, Springfield, Mass., assignor to Westinghouse Electric & Manufacturing Company, a corporation of Pennsylvania
Application August 14, 1937, Serial No. 71,090
Term of patent 7 years



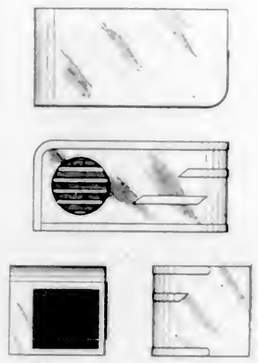
The ornamental design for a base for electric fans or the like, substantially as shown.

106,984
DESIGN FOR A BASE FOR ELECTRIC FANS OR THE LIKE
Ralph E. Kruck, Springfield, Mass., assignor to Westinghouse Electric & Manufacturing Company, a corporation of Pennsylvania
Application August 14, 1937, Serial No. 71,092
Term of patent 7 years



The ornamental design for a base for electric fans or the like, substantially as shown.

106,985
DESIGN FOR A BASE FOR ELECTRIC FANS OR THE LIKE
Ralph E. Kruck, Springfield, Mass., assignor to Westinghouse Electric & Manufacturing Company, a corporation of Pennsylvania
Application August 14, 1937, Serial No. 71,093
Term of patent 7 years

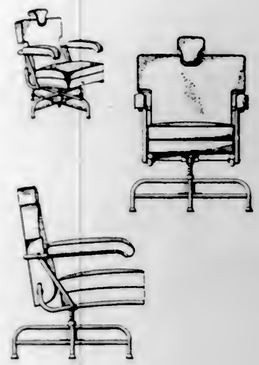


The ornamental design for a base for electric fans or the like substantially as shown.

106,986
DESIGN FOR A PNEUMATIC CUSHION
Frank G. Manson, Dayton, Ohio
Application September 9, 1937, Serial No. 71,527
Term of patent 3½ years

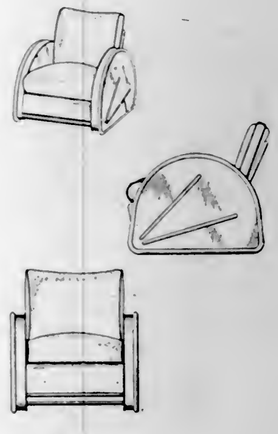
The ornamental design for a pneumatic cushion substantially as shown.

106,987
DESIGN FOR AN AIR CONDITIONING MACHINE CASING
Guy Paschal, New York, N. Y.
Application September 28, 1936, Serial No. 65,038
Term of patent 3½ years



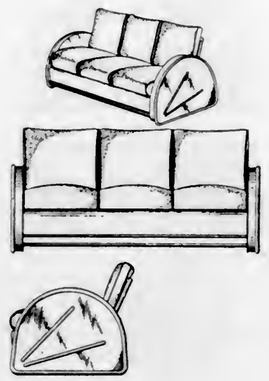
The ornamental design for an air conditioning machine casing, as shown.

106,988
DESIGN FOR A SACHET
Isidore Perlmutter, New York, N. Y.
Application October 8, 1937, Serial No. 72,073
Term of patent 7 years



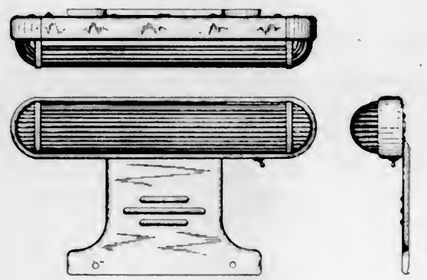
The ornamental design for a sachet, as shown.

106,989
DESIGN FOR A CHAIR
Irving Salomon, Chicago, Ill.
Application August 12, 1937, Serial No. 71,030
Term of patent 7 years



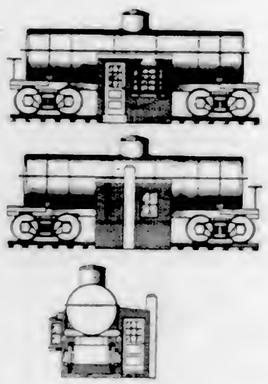
The ornamental design for a chair, as shown.

106,990
DESIGN FOR A CHAIR
Irving Salomon, Chicago, Ill.
Application August 12, 1937, Serial No. 71,035
Term of patent 7 years



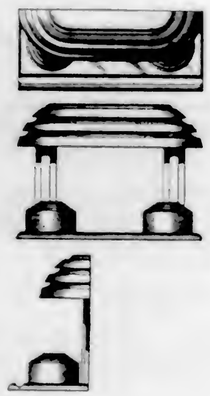
The ornamental design for a chair, as shown.

106,991
DESIGN FOR A SETTEE
Irving Salomon, Chicago, Ill.
Application August 12, 1937, Serial No. 71,036
Term of patent 7 years



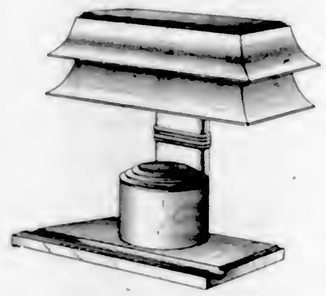
The ornamental design for a settee, as shown.

106,992
DESIGN FOR A COMBINED RANGE LAMP AND BRACKET
Lawrence R. Schroeder, Lakewood, Ohio, assignor to The Cleveland Cooperative Stove Company, Cleveland, Ohio, a corporation of Ohio
Application February 23, 1937, Serial No. 67,817
Term of patent 7 years



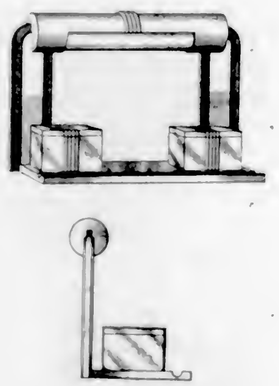
The ornamental design for a combined range lamp and bracket, as shown.

106,993
DESIGN FOR A SERVICE STATION BUILDING
Bernard M. Solomon, Montgomery, Ala.
Application August 4, 1937, Serial No. 70,850
Term of patent 14 years



The ornamental design for a service station building, as shown.

106,994
DESIGN FOR A DESK LAMP OR SIMILAR ARTICLE
Lemuel L. Stewart, Chicago, Ill., assignor to The Adlake Company, a corporation of Illinois
Application May 10, 1937, Serial No. 69,262
Term of patent 14 years

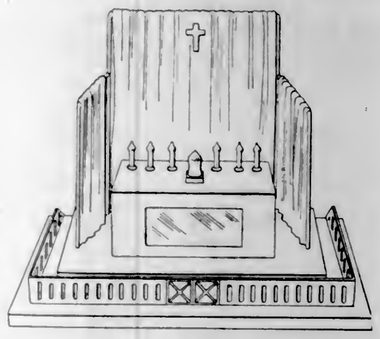


The ornamental design for a desk lamp or similar article, substantially as shown.

106,995
DESIGN FOR A DESK LAMP OR SIMILAR ARTICLE
Lemuel L. Stewart, Chicago, Ill., assignor to The Adlake Company, a corporation of Illinois
Application May 10, 1937, Serial No. 69,263
Term of patent 14 years

The ornamental design for a desk lamp or similar article, substantially as shown, and described.

106,996
DESIGN FOR A DESK LAMP OR SIMILAR ARTICLE
Lemuel L. Stewart, Chicago, Ill., assignor to The Adlake Company, a corporation of Illinois
Application May 10, 1937, Serial No. 69,264
Term of patent 14 years

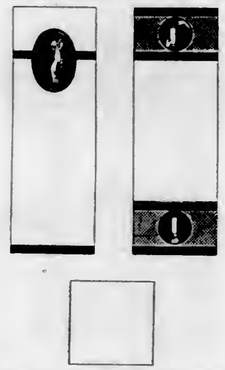


The ornamental design for a desk lamp or similar article, substantially as shown.

106,997
DESIGN FOR A CAN RACK
Erskine D. Thompson, Burlingame, Calif., assignor to Standard Oil Company of California, San Francisco, Calif., a corporation of Delaware
Application July 26, 1937, Serial No. 70,664
Term of patent 14 years

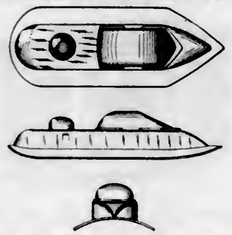
The ornamental design for a can rack, as shown.

106,998
DESIGN FOR A MASS CARD HOLDER
Albert Van Hoe, East Moline, Ill.
Application August 27, 1937, Serial No. 71,353
Term of patent 7 years



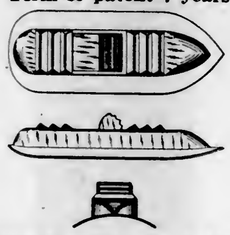
The ornamental design for a mass card holder as shown.

106,999
DESIGN FOR A WINDOW SHADE GUARD
Robert F. Willis, Detroit, Mich.
Application October 12, 1936, Serial No. 65,274
Term of patent 7 years



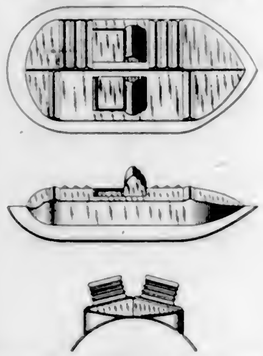
The ornamental design for a window shade guard, as shown.

107,000
DESIGN FOR A CARTON OR SIMILAR ARTICLE
Georges Wilmet, New York, N. Y., assignor to Dixie-Vortex Company, Easton, Pa., a corporation of Delaware
Application August 25, 1937, Serial No. 71,325
Term of patent 14 years



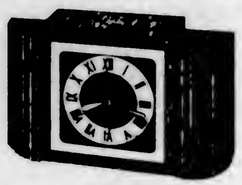
The ornamental design for a carton or similar article as shown and described.

107,001
DESIGN FOR A SWITCH HOUSING FOR FLASHLIGHTS
Orville T. Wood, Clinton, Mass., assignor to Blake Manufacturing Corporation, Clinton, Mass., a corporation of Massachusetts
Application May 14, 1937, Serial No. 69,351
Term of patent 7 years



The ornamental design for a switch housing for flashlights as shown.

107,002
DESIGN FOR A SWITCH HOUSING FOR FLASHLIGHTS
Orville T. Wood, Clinton, Mass., assignor to Blake Manufacturing Corporation, Clinton, Mass., a corporation of Massachusetts
Application May 14, 1937, Serial No. 69,352
Term of patent 7 years



The ornamental design for a switch housing for flashlights as shown.

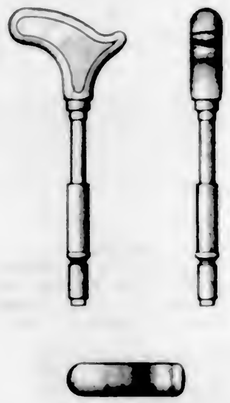
107,003
DESIGN FOR A SWITCH HOUSING FOR FLASHLIGHTS
Orville T. Wood, Clinton, Mass., assignor to Blake Manufacturing Corporation, Clinton, Mass., a corporation of Massachusetts
Application May 14, 1937, Serial No. 69,353
Term of patent 7 years

The ornamental design for a switch housing for flashlights as shown.

107,004
DESIGN FOR A CLOCK CASE
Jacques M. Bars, New York, N. Y., assignor to Warren Telechron Company, a corporation of Maine
Application October 5, 1937, Serial No. 71,982
Term of patent 14 years

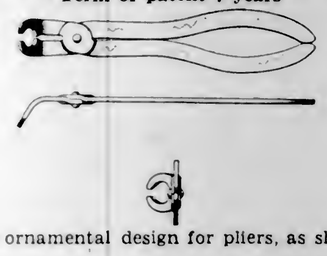
The ornamental design for a clock case as shown.

107,005
DESIGN FOR A RUG
Richard F. Bemporad, New York, N. Y.
Application September 24, 1937, Serial No. 71,775
Term of patent 7 years



The ornamental design for a rug, as shown.

107,006
DESIGN FOR A WRAPPING PAPER OR SIMILAR ARTICLE
Theodore L. Carter, St. Louis, Mo., assignor to Orchard Paper Company, St. Louis, Mo., a corporation of Missouri
Application October 4, 1937, Serial No. 71,951
Term of patent 7 years

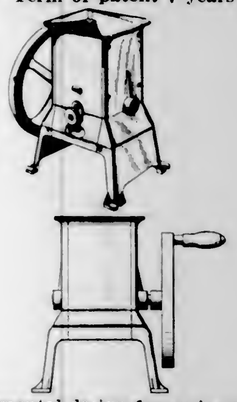


The ornamental design for a wrapping paper or similar article, as shown.

107,007
DESIGN FOR A PISTOL-GRIP SCREW DRIVER
Joseph M. Cashmore, Chicago, Ill., assignor to Montgomery Ward & Co., Incorporated, Chicago, Ill., a corporation of Illinois
Application January 14, 1937, Serial No. 67,064
Term of patent 14 years

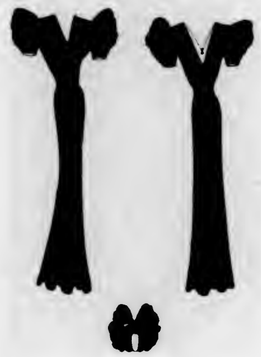
The ornamental design for a pistol-grip screw driver, as shown.

107,008
DESIGN FOR PLIERS
Martin C. Dellinger, Lancaster, Pa.
Application March 25, 1936, Serial No. 61,782
Term of patent 7 years



The ornamental design for pliers, as shown.

107,009
DESIGN FOR A SHOE
Tima Dronoff, New York, N. Y.
Application October 8, 1937, Serial No. 72,062
Term of patent 3½ years

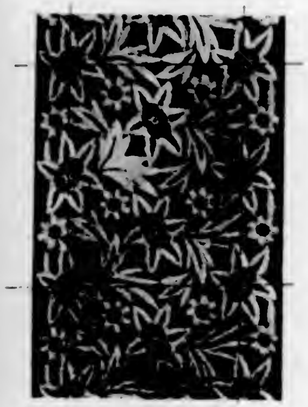


The ornamental design for a shoe substantially as shown.

107,010
DESIGN FOR AN ICE CRUSHER
Thomas J. Fegley, Jenkintown, and George O. Leopold, Philadelphia, Pa., assignors to North Bro's M'f'g Co., Philadelphia, Pa., a corporation of Pennsylvania
Application September 27, 1937, Serial No. 71,826
Term of patent 7 years

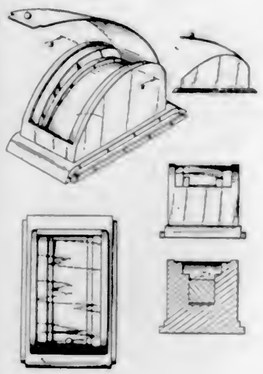
The ornamental design for an ice crusher, substantially as shown.

107,011
DESIGN FOR A DRESS
Benjamin Fried, New York, N. Y.
Application August 9, 1937, Serial No. 70,917
Term of patent 3½ years



The ornamental design for a dress substantially as shown.

107,012
DESIGN FOR A DRESS
Benjamin Fried, New York, N. Y.
Application August 14, 1937, Serial No. 71,085
Term of patent 3½ years



The ornamental design for a dress substantially as shown.

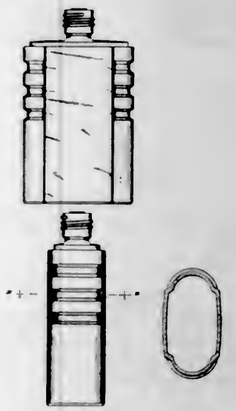
107,013
DESIGN FOR A LACE
Paul Groebli, New York, N. Y.
Application October 22, 1937, Serial No. 72,365
Term of patent 3½ years

The ornamental design for a lace substantially as shown and described.

107,014
DESIGN FOR A DISPLAY CONTAINER FOR JEWELRY OR SIMILAR ARTICLES
John B. Guttman, Brooklyn, N. Y., assignor to Jacob J. Schmukler and Bernard M. Schmukler, co-partners doing business as J. J. Schmukler & Son
Application October 7, 1937, Serial No. 72,037
Term of patent 3½ years

The ornamental design for a display container for jewelry or similar articles, as shown.

107,015
DESIGN FOR AN ARTIFICIAL BOUTONNIERE
Harry Haimes, New York, N. Y.
Application October 6, 1937, Serial No. 71,988
Term of patent 3½ years

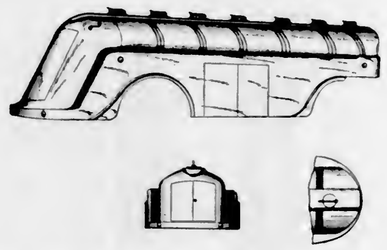


The ornamental design for an artificial boutonniere, substantially as shown, and described.

107,016
DESIGN FOR A RING MOUNTING OR SIMILAR ARTICLE OF JEWELRY
Paul E. Hanson, Seattle, Wash.
Application May 4, 1937, Serial No. 69,160
Term of patent 7 years

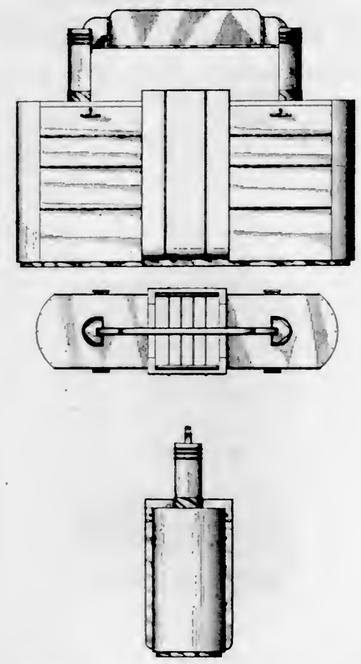
The ornamental design for a ring mounting or similar article of jewelry, as shown.

107,017
DESIGN FOR A GLASS BOTTLE
Lawrence J. Kihn, Pittsburgh, Pa., assignor to J. T. & A. Hamilton Company, a corporation of Pennsylvania
Application August 18, 1937, Serial No. 71,167
Term of patent 14 years



The ornamental design for a glass bottle substantially as shown.

107,018
DESIGN FOR A SPOON OR OTHER ARTICLE OF FLATWARE
Alfred G. Kintz, Wallingford, Conn., assignor to International Silver Company, Meriden, Conn., a corporation of New Jersey
Application October 15, 1937, Serial No. 72,207
Term of patent 14 years

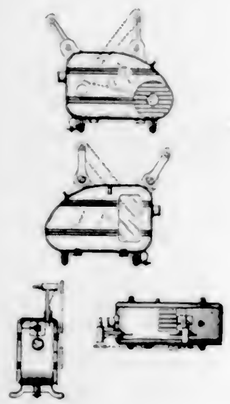


The ornamental design for a spoon or other article of flatware, substantially as shown and described.

107,019
DESIGN FOR A TRAILER TANK VEHICLE BODY
Joseph M. Kramer and Hugh A. Mullin, Kansas City, Mo.; said Mullin and said Kramer assignors to Andrew A. Kramer, Kansas City, Mo.
Application September 20, 1935, Serial No. 58,631
Term of patent 14 years

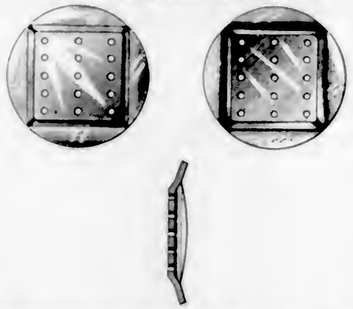
The ornamental design for a trailer tank vehicle body substantially as shown.

107,020
DESIGN FOR A COMBINED HOSE TOWER AND CABINET FOR AUTOMOBILE SERVICE STATIONS OR SIMILAR ARTICLES
Willis A. Kropp, Oak Park, Ill., assignor to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia
Application July 8, 1937, Serial No. 70,301
Term of patent 3½ years



The ornamental design for a combined hose tower and cabinet for automobile service stations or similar articles, as shown.

107,021
DESIGN FOR A COAT
Benjamin Lefrak, New York, N. Y.
Application October 20, 1937, Serial No. 72,329
Term of patent 3½ years



The ornamental design for a coat, substantially as shown.

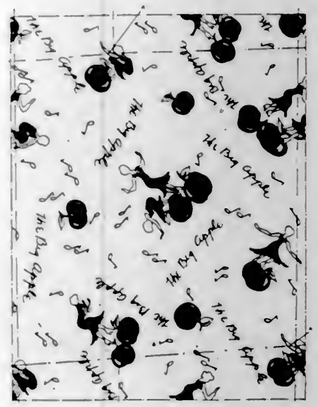
107,022
DESIGN FOR A PROJECTOR
Max Levey, Chicago, Ill., assignor to Excel Projector Corp., Chicago, Ill., a corporation of Illinois
Application October 1, 1937, Serial No. 71,921
Term of patent 7 years

The ornamental design for a projector, as shown.

107,023
DESIGN FOR A BUTTON
Jesse S. Lichter, Lawrence, N. Y.
Application June 19, 1937, Serial No. 69,920
Term of patent 3½ years

The ornamental design for a button, as shown and described.

107,024
DESIGN FOR A BOTTLE
Frederick W. Lohse, Attleboro, Mass., assignor to T. J. Holmes Company, Inc., Norton, Mass., a corporation of Massachusetts
Application April 13, 1937, Serial No. 68,728
Term of patent 7 years

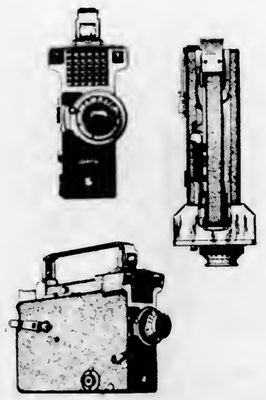


The ornamental design for a bottle as shown.

107,025
DESIGN FOR A SHOE
Edwin W. McCain, St. Louis, Mo.
Application October 8, 1937, Serial No. 72,063
Term of patent 3½ years

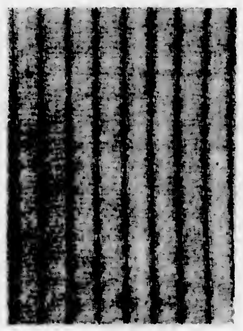
The ornamental design for a shoe substantially as shown.

107,026
DESIGN FOR A TEXTILE FABRIC
Sidney Messer, New York, N. Y.
Application October 16, 1937, Serial No. 72,225
Term of patent 3½ years



The ornamental design for a textile fabric substantially as shown and described.

107,027
DESIGN FOR A TEXTILE FABRIC
Sidney Messer, New York, N. Y.
Application October 16, 1937, Serial No. 72,226
Term of patent 3½ years

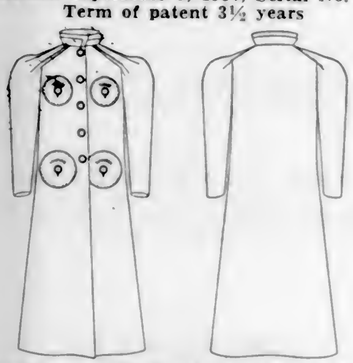


The ornamental design for a textile fabric substantially as shown and described.

107,028
DESIGN FOR A MOTION PICTURE CAMERA
Joseph Mihalyi, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
Application October 8, 1937, Serial No. 72,074
Term of patent 14 years

The ornamental design for a motion picture camera, substantially as shown.

107,029
DESIGN FOR A KNITTED FABRIC
Jack Minoff, Newark, N. J.
Application October 5, 1937, Serial No. 71,975
Term of patent 14 years



The ornamental design for a knitted fabric, substantially as shown and described.

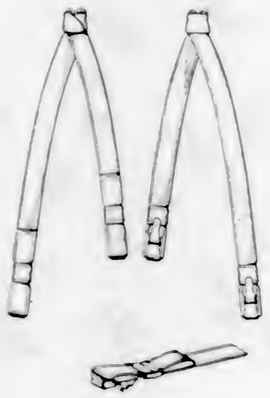
107,030
DESIGN FOR A GOBLET OR SIMILAR ARTICLE
Earl W. Newton, Evanston, Ill., assignor to Imperial Glass Corporation, Bellaire, Ohio, a corporation of Ohio
Application March 9, 1937, Serial No. 68,080
Term of patent 7 years

The ornamental design for a goblet or similar article, as shown.

107,031
DESIGN FOR A COAT
Nathan Prigozen, New York, N. Y.
Application September 9, 1937, Serial No. 71,513
Term of patent 3½ years

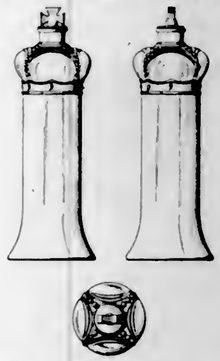
The ornamental design for a coat, substantially as shown.

107,032
DESIGN FOR A MEDALLION
Peter H. Raap, Oak Park, Ill., assignor to Central Metallic Casket Co., Chicago, Ill., a corporation of Illinois
Application August 16, 1937, Serial No. 71,107
Term of patent 14 years



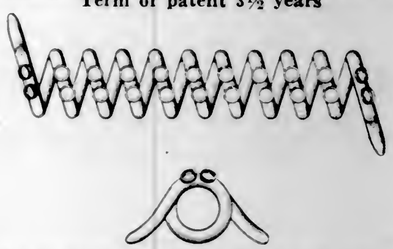
The ornamental design for a medallion as shown and described.

107,033
DESIGN FOR A SHOE
Morris Rosenston, Boston, Mass.
Application September 18, 1937, Serial No. 71,681
Term of patent 3½ years



The ornamental design for a shoe, substantially as shown.

107,034
DESIGN FOR A COAT TIE
Morris Rosow, Philadelphia, Pa.
Application July 12, 1937, Serial No. 70,366
Term of patent 7 years



The ornamental design for a coat tie, as shown.

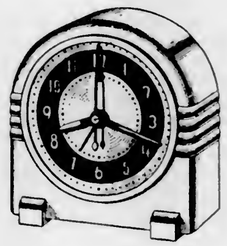
107,035
DESIGN FOR A COMBINED BOTTLE AND STOPPER
Eula Manes Stone, New York, N. Y., assignor to Prince Matchabelli, Inc., a corporation of New York
Application May 11, 1937, Serial No. 69,289
Term of patent 14 years

An ornamental design for a combined bottle and stopper as shown.

107,036
DESIGN FOR A FLOWER HOLDER
Lewis P. Weil, Germantown, Pa.
Application August 25, 1937, Serial No. 71,317
Term of patent 3½ years

The ornamental design for a flower holder as shown.

107,037
DESIGN FOR A BROOCH
Harold Weiner, Providence, R. I.
Application July 24, 1937, Serial No. 70,622
Term of patent 3½ years

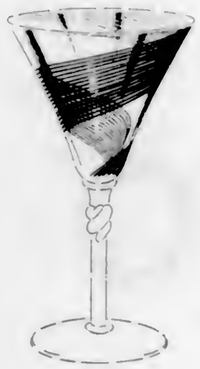


The ornamental design for a brooch substantially as shown.

107,038
DESIGN FOR A SPOON OR OTHER ARTICLE OF FLATWARE
Edward P. Zawisza, Meriden, Conn., assignor to International Silver Company, Meriden, Conn., a corporation of New Jersey
Application October 15, 1937, Serial No. 72,204
Term of patent 14 years

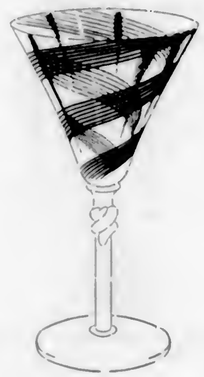
The ornamental design for a spoon or other article of flatware, substantially as shown and described.

107,039
DESIGN FOR A CLOCK CASE
Frank W. Green, Framingham, Mass., assignor to Warren Telechron Company, a corporation of Maine
Application October 6, 1937, Serial No. 72,025
Term of patent 14 years



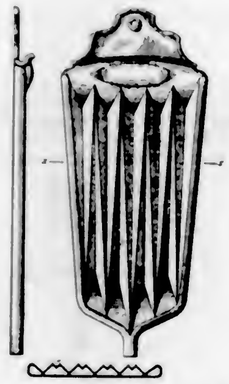
The ornamental design for a clock case as shown.

107,040
DESIGN FOR A GOBLET OR SIMILAR ARTICLE
Andrew J. Cunningham, Snyder, N. Y.
Application August 1, 1936, Serial No. 64,172
Term of patent 14 years



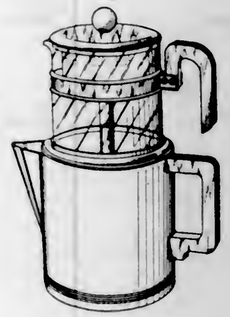
The ornamental design for a goblet or similar article as shown and described.

107,041
DESIGN FOR A GOBLET OR SIMILAR ARTICLE
Andrew J. Cunningham, Snyder, N. Y.
Application June 30, 1937, Serial No. 70,174
Term of patent 7 years



The ornamental design for a goblet or similar article as shown.

107,042
DESIGN FOR A GOBLET OR SIMILAR ARTICLE
Andrew J. Cunningham, Snyder, N. Y.
Application June 30, 1937, Serial No. 70,175
Term of patent 7 years

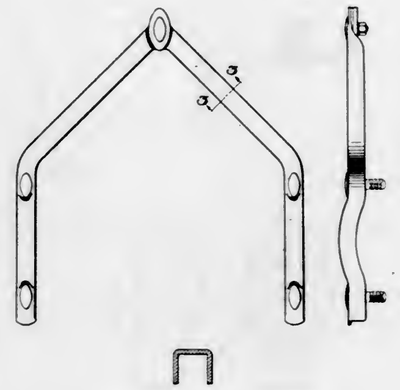


The ornamental design for a goblet or similar article as shown.

107,043
DESIGN FOR A FOUNTAIN BAG OR THE LIKE
Frank Dabroski, Matawan, N. J.
Application September 3, 1937, Serial No. 71,447
Term of patent 14 years

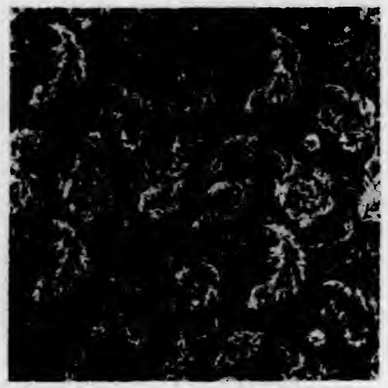
The ornamental design for a fountain bag or the like as shown.

107,044
DESIGN FOR A COFFEE PERCOLATOR
Samuel H. Geffner, Brooklyn, N. Y.
Application April 8, 1937, Serial No. 68,627
Term of patent 7 years



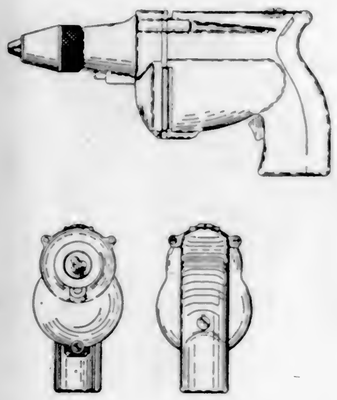
The ornamental design for a coffee percolator, as shown and described.

107,045
DESIGN FOR A HANDBAG
Arthur Harrison Love, New York, N. Y.
Application October 12, 1937, Serial No. 72,129
Term of patent 3½ years



The ornamental design for a handbag, substantially as shown.

107,046
DESIGN FOR A VERTICAL BUMPER
William E. Porter, Lowell, Mass., assignor to A. S. Campbell Co., Inc., East Boston, Mass., a corporation of Massachusetts
Application June 19, 1937, Serial No. 69,926
Term of patent 7 years



The ornamental design for a vertical bumper, substantially as shown.

107,047
DESIGN FOR A TEXTILE FABRIC
Bernard Adler, New York, N. Y.
Application October 27, 1937, Serial No. 72,463
Term of patent 3½ years

The ornamental design for a textile fabric substantially as shown.

107,048
DESIGN FOR A POWER DRIVEN HAND TOOL UNIT
Charles Desoutter, London, England
Application April 28, 1937, Serial No. 69,021
Term of patent 14 years

The ornamental design for a power driven hand tool unit, as shown.

107,049
DESIGN FOR A DRESS
Pauline Fracchia, New York, N. Y.
Application October 14, 1937, Serial No. 72,174
Term of patent 3½ years

The ornamental design for a dress, substantially as shown, and described.

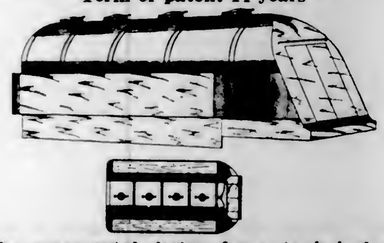
107,050
DESIGN FOR A DRESS
Pauline Fracchia, New York, N. Y.
Application October 14, 1937, Serial No. 72,177
Term of patent 3½ years

The ornamental design for a dress, substantially as shown.

107,051
DESIGN FOR A DRESS
Harry Goldman, New York, N. Y.
Application October 14, 1937, Serial No. 72,179
Term of patent 3½ years

The ornamental design for a dress, substantially as shown, and described.

107,052
DESIGN FOR A DRESS
Harry Goldman, New York, N. Y.
Application October 20, 1937, Serial No. 72,327
Term of patent 3½ years

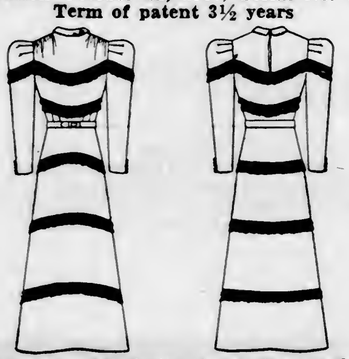


The ornamental design for a dress, substantially as shown.

107,053
DESIGN FOR A DRESS
Harry Goldman, New York, N. Y.
Application October 20, 1937, Serial No. 72,328
Term of patent 3½ years

The ornamental design for a dress, substantially as shown.

107,054
DESIGN FOR A TANK BODY FOR VEHICLES
Andrew A. Kramer, Joseph M. Kramer, and Ward M. Gadberry, Kansas City, Mo.; said Gadberry and said Joseph M. Kramer assignors to said Andrew A. Kramer
Application August 24, 1935, Serial No. 58,282
Term of patent 14 years



The ornamental design for a tank body for vehicles substantially as shown.

107,055
DESIGN FOR A DRESS
Elfie N. Perper, New York, N. Y.
Application October 22, 1937, Serial No. 72,367
Term of patent 3½ years

The ornamental design for a dress, substantially as shown.

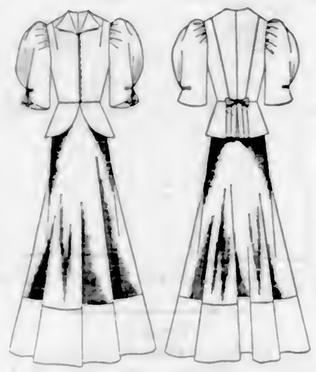
107,056
DESIGN FOR A DRESS
David William Price, New York, N. Y.
Application October 21, 1937, Serial No. 72,349
Term of patent 3½ years

The ornamental design for a dress, substantially as shown.

107,057
DESIGN FOR A DRESS
Philip Schleasel, New York, N. Y.
Application October 14, 1937, Serial No. 72,180
Term of patent 3½ years

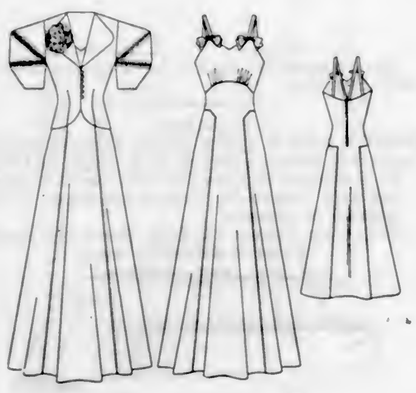
The ornamental design for a dress, substantially as shown.

107,058
DESIGN FOR A NEGLIGEE
Ethel Eaton Stricker, New York, N. Y.
Application September 27, 1937, Serial No. 71,818
Term of patent 3½ years



The ornamental design for a negligee, substantially as shown.

107,059
DESIGN FOR A TEXTILE FABRIC
Hans W. Wilde, North Bergen, N. J.
Application October 27, 1937, Serial No. 72,461
Term of patent 3½ years



The ornamental design for a textile fabric substantially as shown.

107,060
DESIGN FOR A DRESS
Irving Aaronson, New York, N. Y.
Application October 23, 1937, Serial No. 72,380
Term of patent 3½ years

The ornamental design for a dress, substantially as shown.

107,061
DESIGN FOR A DRESS ENSEMBLE
Philip Wenett, New York, N. Y.
Application October 22, 1937, Serial No. 72,360
Term of patent 3½ years

The ornamental design for a dress ensemble, substantially as shown and described.

THE
OFFICIAL GAZETTE
OF THE
United States Patent Office

Vol. 484—No. 4 TUESDAY, NOVEMBER 23, 1937 Price—$16 per year

The OFFICIAL GAZETTE is mailed under the direction of the Superintendent of Documents, Government Printing Office, to whom all subscriptions should be made payable and all communications respecting the Gazette should be addressed. Issued weekly. Subscriptions, $16.00 per annum, including annual index, $18.75; single numbers, 35 cents each.
PRINTED COPIES OF PATENTS are furnished by the Patent Office at 10 cents each. For the latter address the Commissioner of Patents, Washington, D. C.
CIRCULARS OF GENERAL INFORMATION concerning PATENTS or concerning TRADE-MARKS, PRINTS, and LABELS will be sent without cost on request to the Commissioner of Patents, Washington, D. C.

Adverse Decisions in Interference

In interferences involving the indicated claims of the following patents final decisions have been rendered that the respective patentees were not the first inventors with respect to the claims listed:

Pat. 2,017,551, E. E. Statter, Sanitary napkin belt clasp, decided October 25, 1937, claims 2 and 3.

Pat. 2,042,450, E. O. Blodgett, Centralized traffic controlling system for railroads, decided October 12, 1937, claims 1, 9, 13, 14, 16, and 17.

Pat. 2,042,670, R. C. Leake, Centralized traffic control system, decided November 3, 1937, claims 1, 2, and 8.

Pat. 2,045,900, O. H. Dicke, Interlocking system for railroads, decided November 4, 1937, claims 1, 2, and 3.

Pat. 2,067,037, E. C. Alexander, Crossing slab, decided October 29, 1937, claim 4.

Pat. 2,079,157, Martin De Lin, Circulation control for furnaces, decided October 30, 1937, claims 1 and 2.

Pat. 2,072,789, I. A. Anson. Hydrocarbon process, decided October 29, 1937, claim 1.

Interference Notices

U. S. PATENT OFFICE, *Washington, D. C., Nov. 4, 1937.*

Florida Citrus Products Corporation, its assigns or legal representatives, take notice:

An interference having been declared by this Office between the application of Redlands Mutual Orange Association, 331 North Fourth St., Redlands, California, for registration of a trade-mark and trade-mark registered February 15, 1927, No. 224,038, to Florida Citrus Products Corporation, Haines City, Florida, and 136 Franklin St., New York, N. Y., and the notice of such proceeding sent by registered mail to said Florida Citrus Products Corporation at the said addresses having been returned by the post office as undeliverable, notice is hereby given that unless said Florida Citrus Products Corporation, its assigns or legal representatives, shall enter an appearance therein within thirty days from the first publication of this order the interference will be proceeded with as in the case of default. This notice will be published in the OFFICIAL GAZETTE for three consecutive weeks.

JUSTIN W. MACKLIN,
First Assistant Commissioner.

U. S. PATENT OFFICE, *Washington, D. C., Nov. 4, 1937.*

Charles N. Cox, his assigns or legal representatives, take notice:

An interference having been declared by this Office between the application of Redlands Mutual Orange Association, 331 North Fourth St., Redlands, California, for registration of a trade-mark and trade-mark registered February 21, 1928, No. 239,038, to Charles N. Cox, 421 Flamingo Drive, West Palm Beach, Florida, and the Office having been unable to obtain satisfactory service upon said Cox, notice is hereby given that unless said Charles N. Cox, his assigns or legal representatives, shall enter an appearance therein within thirty days from the first publication of this order the interference will be proceeded with as in the case of default. This notice will be published in the OFFICIAL GAZETTE for three consecutive weeks.

JUSTIN W. MACKLIN,
First Assistant Commissioner.

Drawings

Attention is called to paragraphs *g* and *i* of Rule 52 of the Rules of Practice of the Patent Office, and inventors and attorneys are directed to omit from the space outside of the marginal line of the drawings any marks of identification, inasmuch as the space referred to is reserved for the use of the Patent Office. Such identifying marks should be placed upon the back of the drawings.

Condition of Applications Under Examination at Close of Business November 6, 1937

(Total number of applications awaiting action, excluding Trade-Mark Division, 42,244; Trade-Mark Division, 1,454. Oldest new case, May 18, 1937; oldest amended, May 1, 1937)

DECISIONS IN PATENT AND TRADE-MARK CASES

Errata

U. S. Court of Appeals for the District of Columbia

BATTERY PATENTS CORPORATION *v.* COE

In the report of the above identified case in the Official Gazette of November 9, 1937, vol. 484, page 257, there is an error in syllabus No. 3, and an error in the paragraph following it. These portions of the report are corrected to read:

3. SAME—SAME—COMBINED BICYCLE GUARD AND LAMP.

Design for a combined bicycle guard and lamp *Held* patentable over the prior art.

APPEAL from the District Court of the United States for the District of Columbia. Reversed.

U. S. Court of Customs and Patent Appeals

IN RE BROWN

No. 3,787. Decided March 29, 1937

[88 F.(2d) 703]

PATENTABILITY—CONTOUR ADJUSTING DEVICE.

Certain claims for a contour shaping machine *Held* patentable over the prior art.

APPEAL from the Patent Office. Modified.

Mr. J. Preston Siwecker and *Mr. Maxwell E. Sparrow* for Brown.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

GRAHAM, *P. J.:*

The appellant made application to the United States Patent Office for a patent upon certain "new and useful improvements in Automatic Contour Shaping Fixture." The apparatus for which patent was sought was a device by which objects could be ground into a shape identical with a form which it was desired to duplicate, particularly small objects of glass, like watch crystals, or lenses of optical devices, curved or straight in cross section. A fairly good idea of the device may be had by examination of two claims which are thought to be typical, namely, 43 and 47, which are as follows:

43. In a contour shaping machine, the combination with a pattern, and work holder operable therewith, of a shaper and a gauge in axial alinement, a carriage for supporting, and moving in a fixed path said pattern and said work holder toward and from said shaper and said gauge, means for rotating said work holder and said pattern, said gauge having a working surface of varying concentric diameters against which the said pattern may ride, said working surface being concentric with the shaping surface of said shaper, means to micrometrically longitudinally adjust said gauge and said pattern relative to each other whereby the peripheral contour of said pattern is accurately reproduced in direct proportion on a piece of work, which may be held by the work holder and shaped by the shaper, at all points of said relative adjustment, and means for lockingly maintaining said adjustment.

47. In a contour shaping apparatus, the combination with a pattern and a work holder operable therewith, of a gauge against which the pattern may ride, and a shaper, the working surface of said gauge and of said shaper being concentric and said gauge and said shaper being in axial alinement, whereby the concentricity between said working surfaces are constantly maintained, a carriage for supporting, and moving in a fixed path said pattern and said work holder towards and from said shaper and said gauge, means for rotating said work holder and said pattern, means to longitudinally vary the working surface of the gauge relative to the working surface of the shaper, and means for locking the gauge in any position.

The Board of Appeals, in its decision, described the device as follows:

The invention relates to a contour-shaping machine. As shown in Fig. 1, it includes a stationary standard 77 on which a frusto conical gauge 83 is mounted for axial adjustment. A rotatable grinding wheel or shaper 85 concentric with the gauge is mounted adjacent to it. A work-holding frame is pivoted on a standard at one side of the gauge and shaper so that it can be swung toward and away from them. This frame carries a work-holder 73 and 74 and a pattern 87 on the same shaft as the work-holder. When the work-holder frame is swung toward the shaper 85, the pattern 87 engages gauge 83. As shown in Fig. 3ª, the pattern and work-holder are relatively axially adjustable. Likewise, the gauge 83 is axially adjustable with respect to the shaper. The adjusting means include micrometric screws.

Some claims were allowed, but claims 43 to 47, inclusive, were denied by both the Examiner and Board of Appeals. A petition for rehearing was filed and denied, and the case comes here for review. The Examiner cited the following references in his rejection: Gubbins (British), No. 3265, July 10, 1882; Besson et al., 374,332, Dec. 27, 1887; Bader, 737,313, August 25, 1903; Long, 686,676, November 12, 1901.

The Board of Appeals cited the same references but the record does not contain the Bader and Besson et al. patents, so that the court has not had the benefit of an inspection of the same. However, their application to the case is not left in doubt by the record. The Examiner was of the opinion that claims 43 to 47, inclusive, were not patentable over the patent to Gubbins,

"especially in view of patent to Long or Bader or Besson et al. as applied above to claims 28 and 38 to 40 inclusive."

As to this part of the case, the Examiner states:

It seems that the definition of the work holder in these claims (in claim 43, line 2 and claim 44, line 2 for instance) can be read only on applicant's rotatable work clamping heads 49 and 57 and spindles 48 and 56 because these claims also call for means for rotating the work holder. The rocking frame 24, 27, etc., for supporting the work holding and rotating spindles 48 and 56 and heads 49 and 57 is not a part rotated by the work holder rotating means and probably cannot be considered to be included in the definition of the work holder. The rocking frame is not otherwise included in these claims and the statement in claim 43, lines 3–5 for instance, and the other claims to the effect that the pattern and work holder are movable in a fixed path relative to the shaper and gauge claims the function of the rocking frame without claiming the rocking frame as a tangible structural element. Therefore, these claims do not appear to require the Gubbins patent to show a support for work holder S of that patent.

As to the swingable unit upon which the work holder is mounted, the Board of Appeals says:

Some of the appealed claims recite that the work-holder and the pattern are mounted on a swingable unit. The Gubbins patent shows the work-holder and pattern connected together as a unit, and this unit is moved toward and away from the shaper. Since it is old in other patents cited to mount the work-holder and the pattern on a swingable frame, we believe that no invention is involved in making this change in Gubbins.

These, therefore, constitute the positions of the Patent Office tribunals upon the question of the swingable arm for the work unit.

Throughout the prosecution of this application, the appellant has insisted that he has developed a new and valuable feature, namely, the micrometric adjusting means which his device contains. But

little attention has been given to this matter by the Patent Office tribunals. The Board of Appeals, on its part, says the following:

Applicant's main argument is that Gubbins does not show micrometric adjusting means for the gauge *O* and locking means for it in any adjusted position. If the screw threads in the patent are made with sufficiently small pitch, it is evident that the gauge *O* can readily be adjusted to any degree of accuracy necessary. Hence, the patent has micrometric adjusting means. Apparently, the friction between the screw threads is depended upon in Gubbins to hold the gauge in its adjusted position so it will not shift. If the threads fit tight, this will be sufficient to retain the gauge in adjusted position. If an additional set screw be desired, it can be added to the gauge hub and thus hold the gauge more securely. We do not regard this as involving invention.

It will be observed that claim 43, which is hereinbefore quoted, recites, in part:

"• • • means to micrometrically longitudinally adjust said gauge and said pattern relative to each other • • • and means for lockingly maintaining said adjustment."

This language is contained in all the rejected claims, except claim 47.

We are told by the Solicitor for the Patent Office that the patents which are absent from this record, namely, Bader and Besson et al., have to do with the swingable arm. The patent to Long is along the same line. We must, therefore, rely upon Gubbins for any showing of the micrometric adjustment. If it is to be assumed that there is no invention in arranging a swingable arm, as the Patent Office presumes, we are nevertheless convinced that it is patentable to arrange a micrometric adjustment combined with a means of locking the same so that the piece, when once adjusted to nicety and with precision, can be held in this place during the entire operation.

Gubbins shows no such arrangement. An inspection of his figures discloses that the vibration of the parts will very readily cause a loosening and a changing of position, so that a piece of work which is fastened within the holder will become misplaced, and the gauge and work which is held against the grinding wheel and its pattern will readily become misplaced and misshapen. In fact, it is quite impossible to understand how the best of work can be done upon such a device. The appellant here, however, has perfected a device by which, with the greatest precision, the work can be adjusted, and with which it can be held firmly while the subsequent proceedings are continuing.

In our opinion, the appellant has made a contribution to the art, and the Board of Appeals was in error in refusing the appellant's claims 43, 44, 45, and 46.

Claim 47, however, is not in the same category. So far as it appears, this claim does not contain the micrometric, in combination with the adjustment, features, and the Board of Appeals did not err in refusing to allow it.

The decision of the Board of Appeals of the United States Patent Office is modified, its decision as to claim 47 being affirmed, and its decision as to claims 43, 44, 45, and 46 being reversed.

Modified.

HATFIELD, *J.*, did not participate in this case.

U. S. Court of Customs and Patent Appeals

IN RE SMOLAK AND MCQUADE

No. 3,748. Decided April 5, 1937

[88 F.(2d) 838]

PATENTABILITY—RIGID SHINGLE.

Claims for a rigid shingle *Held* unpatentable over the prior art.

APPEAL from the Patent Office. Affirmed.

Mr. Clair W. Fairbank for Smolak et al.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

HATFIELD, *J.*:

This is an appeal from the decision of the Board of Appeals of the United States Patent Office affirming the decision of the Primary Examiner rejecting the appealed claims, Nos. 21 and 22, in appellants' application for a patent for an alleged invention relating to a "unit of structural material of uneven surface, and particularly", according to the specification, "to a rigid shingle with an irregularly corrugated surface."

The invention is sufficiently described in the appealed claims which read:

21. A preformed non-inflammable structural unit, adapted for use as a siding slab, shingle, and the like, consisting chiefly of asbestos fibers and Portland cement and including, on the face thereof, elevated portions extending in irregularly longitudinal manner and to irregularly varying elevations, depressed portions alternating with the elevated portions and extending in irregularly longitudinal manner and to irregularly varying depths, and intermediate portions of irregularly sloping surfaces defined between the said elevated and depressed portions, whereby the unit is adapted to reflect light in diffuse manner.

22. A rigid shingle comprising an end adapted to be exposed on its face to view and another end adapted to be concealed from view in a finished roof assembly, the end adapted to be exposed having a rear surface that is substantially plane and having a face including elevated portions extending in irregularly longitudinal manner and to irregularly varying elevations, depressed portions alternating with the elevated portions and extending in an irregularly longitudinal manner and to irregularly varying depths, and intermediate portions of irregularly sloping surfaces defined between the said elevated and depressed portions and the said end adapted to be concealed from view having substantially plane front and rear surfaces.

The references are: Scharwath et al., 1,404,483, Jan. 24, 1922; Perry, 1,451,369, Apr. 10, 1923; Putman, 1,577,150, Mar. 16, 1926; Fischer, 1,584,023, May 11, 1926.

In its decision, the Board of Appeals made the following observation:

It is noted that applicants have proposed an amendment, changing the term, "unbroken," or otherwise modifying each of the claims to substitute *molded*, relating to the irregularities of the surface. The claims are being considered as with these amendments entered.

In explanation of the Board's statement, counsel for appellants state that—

In copying these claims, we have inserted the limitation "molded", because they were amended after the final rejection to include this word, and the Board of Appeals considered the claims as so amended (R. 18).

In his brief the Solicitor for the Patent Office states, in substance, that, although as "it formally stands of record in the application file" claim 21 does not include the word "molded," in copying it he had inserted the word because the Board of Appeals had "actually considered the claim as if the word 'molded' had been entered therein • • •."

In their brief counsel for appellants state that—

Prior to the advent of the applicants' invention, there was an unsatisfied demand in the building trade for a fireproof, waterproof shingle, which would make an inexpensive and durable covering for roofs or walls, which would not be shiny but would diffuse reflected light, which would not be broken or cracked by frost, which would simulate old weather beaten wooden shingles, and which would harmonize with the old Colonial types of architecture. The demand was not satisfied by anything known to the trade or by anything disclosed in the prior patents relied upon by the Patent Office,

and contend that, in order to meet the demand, appellants used a mixture of "hydraulic cement and reinforcing asbestos fibres" to "produce a strong, durable, waterproof, and fireproof shingle."

It is conceded that the combination of materials used by appellants is old.

The feature claimed by counsel to lend patentability to appellants' product is defined in the appealed claims as—

• • • elevated portions extending in irregularly longitudinal manner and to irregularly varying elevations, depressed portions alternating with the elevated portions and extending in irregularly longitudinal manner and to irregularly varying depths, and intermediate portions of irregularly longitudinal manner and to irregularly sloping surfaces defined between the said elevated and depressed portions.

The Scharwath et al. patent discloses a press molded asbestos cement shingle, the "exposed upper face" of which, according to the specification, is "ribbed or corrugated," the surface being

"broken by a plurality of substantially parallel longitudinally extending ridges • • • and by substantially transversely extending parallel curved intersecting ridges • • •, of comparatively small height • • • merely • • • sufficient to make pronounced markings or roughening of the surface."

Elsewhere the specification states that one object of the invention is to produce an article which will be free of "the glare ordinarily present in roofs of artificial shingle or tile." The words "press molded" appear only in the claims of the reference.

The patent to Perry relates to a strip shingle in which a substantially homogeneous material is used. In his specification the patentee states that

"the impressions are in the main or body portion of the construction strips, which has distributed therethrough the fibrous material, and which is of a homogeneous material capable of receiving and permanently retaining impressions of the desired sort and not merely in any superficial coating on such strips";

that the depressions or grooves may be either straight or curved, and may be of any desired shape, depth, or width; that

"It is, of course, to be understood that in the articles which are the object of my invention the depressions are deep enough to provide of and by themselves the desired appearance of separate unit shingles or tiles without in any way relying on the use of pigmenting or similar materials of various classes to produce the desired effect."

After giving various examples, the patentee states that "Any other desired form of groove or depression may be used"; that they may "be made by pressing the strip between rolls having projections corresponding to the depressions desired," or they may "be made by hand or in any other feasible manner"; and that the depressed or corrugated portions, being of increased density "due to their having been compressed, act as mechanical strengthening members."

The Putman patent is for imitation shake shingles, made of wood, having longitudinal grooves cut therein.

The patent to Fischer is for a fireproof shingle made of asbestos fibers and cement, such as Portland cement, combined together under hydraulic pressure. The upper surface of the butt end (which is described as a "heavy butt end") of the shingle is indented, as shown by the drawings, and as expressed in one of the claims—claim 6, by a

"conglomeration of different sized irregular indentations, said indentations decreasing in depth toward the center of the shingle • • •."

The feature of "decreasing in depth" is particularly emphasized in Fischer's specification as possessing advantages in both utility and appearance. The patent also teaches that

"In shingles of this nature it has become apparent that a rough artistic or rustic surface is desirable, especially where shingles of different colors are employed so as to provide a very artistic appearance to the house on which the shingles are used."

On behalf of appellants there was filed an affidavit by one Seigle, chairman of the Board of Directors of Johns-Manville Corporation, which, the affidavit states, is the assignee of the involved application. The affidavit recites certain alleged advantages of appellants' shingles, and also affirms great commercial success.

It is here argued by counsel for appellants, as it was before the tribunals of the Patent Office, that the Scharwath et al. patent is not a proper reference because the corrugations disclosed therein were not the same as in appellants' application; that as the words "press molded" appeared only in the claims, the Board erred in holding that the exposed surfaces of the shingles were press molded; and that, in view of the fact that there was no description or drawings disclosing that the exposed surfaces of the shingles were press molded, the claims of the patent should never have been allowed by the Patent Office.

Whether the Patent Office should have allowed the claims of the Scharwath et al. patent, is a matter with which this court is not concerned. The fact remains that the claims of that patent disclosed a press molded asbestos cement shingle as early as January 24, 1922.

Counsel for appellants contend that it is well established that, standing alone, the claims of a patent cannot be used as an anticipation "of an invention", and, as authority for their contention, cite our decision in *In re Charles R. Downs* and *Augustus E. Craver*, 18 C. C. P. A. (Patents) 803, 807, 45 F.(2d) 251, 403 O. G. 791, wherein this court, citing as authority the case of *Minerals Separation North American Corporation* v. *Magma Copper Company*, 280 U. S. 400, 392 O. G. 491, inadvertently stated that

"Anticipation is not to be determined from the claims made in the references, but upon the disclosures in the respective specifications."

In the case of *Minerals Separation North American Corporation* v. *Magma Copper Company*, supra, the question of infringement was involved, and the issue before the Supreme Court was whether certain claims in Letters Patent No. 962,678, owned by the petitioner, were anticipated by an earlier Patent No. 835,120, also owned by the petitioner. It appears in that case that, although the petitioner brought suit for infringement in the District Court of Maine for the infringement of Patent No. 835,120,

the complaint, with regard to that patent, was dismissed because the patent was about to expire, and the Minerals Separation North American Corporation was permitted to file a supplemental and amended bill of complaint alleging infringement of certain claims in Patent No. 962,678. The only issue before the Supreme Court, as we understand its decision, was whether the claims involved in Patent No. 962,678 were anticipated by the earlier Patent No. 835,120. In discussing that issue, the court, among other things, said:

"The question is not what is the *Precise scope* of the claims in 835,120, but what is disclosed in the specification and made known to the world." [Italics ours.]

Accordingly, what we should have said in the case of *In re Charles R. Downs* and *Augustus E. Craver*, supra, is that

"Anticipation is not to be determined from the precise scope of the claims made in the references, but upon the disclosures in the respective specifications,"

which, in a reference patent, would include the claims, the written specification, and the drawings.

In the case of *In re Mosher*, 23 C. C. P. A. (Patents) 740, 743, 79 F.(2d) 911, 463 O. G. 463, we said that "the claims are a part of the references." Accordingly, we are of opinion that the Board of Appeals was right in holding that the words "press molded", contained in each of the claims of the Scharwath et al. patent, were a part of the disclosure of that reference.

It appears that the patent to Scharwath et al. discloses a press molded asbestos cement shingle, the surface of the shingle being "broken by a plurality of substantially parallel longitudinally extending ridges" or corrugations, and "by substantially transversely extending parallel curved intersecting ridges" or corrugations. The material out of which those shingles are made would undoubtedly make them fireproof, although no statement is cited to that effect in the reference. The patentee stated that the corrugations on the exposed surface of his shingle prevented the "glare ordinarily present in roofs of artificial shingle", and also gave the shingle a desirable ornamental appearance.

We deem it unnecessary to discuss in detail the other references of record. It is sufficient to say that, although the patentee Perry uses a different material than that used by appellants and the patentees Scharwath et al. and Fischer, nevertheless, he discloses a shingle having depressions, grooves, or corrugations of any desired shape, depth, or width, which might be made by pressing the shingle between rolls having projections corresponding to the desired corrugations.

The patent to Fischer, as hereinbefore noted, is for a fireproof shingle made of asbestos fibers and cement, combined under hydraulic pressure. The exposed surface of his shingle also has irregular indentations.

It may be said that in discussing the patent to Perry the Board of Appeals said:

What seems important in the Perry disclosure is that a roofing strip designated generally as a strip single [shingle] is made of a fibrous material incorporated in a body material by forming depressions or corrugations therein of variable depths by compression. This is said to result in the formation under each depression of a densified reinforcing section and it is stated that any number of such depressions may be employed and they may be of almost any desired shape. It appears that this patent fully discloses the method of making a roofing strip containing a fibrous element in its composition by molding or compression to form depressions in the nature of corrugations therein without cutting the fibrous material, and it is believed that it would not amount to patentable improvement to form a cement asbestos roof strip, such as those shown in Scharwath et al. or Fischer in the same manner.

Appellants' shingles are attractive, and we have no doubt but that they are commercially successful. However, there is nothing of record to establish that their commercial success is due to any factor other than the design formed by the corrugations, and it should be remembered that appellants' application is not for a design patent.

It being old to make press molded fireproof shingles by combining asbestos fibers and cement, the exposed surfaces of the shingles having indentations, corrugations, or grooves, thereby preventing the glare ordinarily present in roofs composed of artificial shingles, and it being old, as taught by the Perry disclosure, to make strip shingles of homogeneous material, and to form corrugations therein of any desired shape or depth by compression, we are of opinion, as was each of the Patent Office tribunals, that the appealed claims are not patentable over the prior art.

The decision of the Board of Appeals is affirmed.
Affirmed.

U. S. Court of Customs and Patent Appeals

IN RE KIMBALL

No. 3,778. Decided March 29, 1937

[88 F.(2d) 717]

PATENTABILITY—METHOD OF DISPENSING SHEET MATERIAL.

Certain claims for a method of dispensing sheet material *Held* unpatentable over the prior art.

APPEAL from the Patent Office. Affirmed.

Mr. Paul Carpenter, *Mr. E. G. Carpenter*, and *Mr. H. H. Benjamin* for Kimball.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

GARRETT, *J.*:

Appellant's application for patent was filed in the United States Patent Office November 25, 1932. Three claims stand allowed, but eighteen were rejected by the Examiner for want of invention over prior art, six of them (the method claims) being also rejected because held to define merely the function of the apparatus. The Board of Appeals affirmed the decision of the Examiner and appellant brings the matter to this court for review.

The rejected claims are numbered 1, 3, 17 to 28, inclusive, and 31 to 34, inclusive. Claims 1, 3, and 22 to 25, inclusive, are method claims. The others are for the apparatus.

As illustrative of the subject matter we quote claims 1 and 17, as follows:

1. A method of dispensing a sheet material having on one side a normally active externally exposed adhesive coating, which includes as steps thereof causing the active adhesive coated side of the sheet to contact with and thereby adhere to a movable measuring surface, and controlling the amount of sheet dispensed by regulating the movement of said surface.

17. In a sheet dispensing apparatus, in combination, means for supporting a quantity of sheet material said material having an exposed and normally pressure sensitive adhesive coating on one surface thereof, and a roller for measuring the sheet material and to which said material is caused to adhere by the action of said coating while dispensing.

The references cited are: Anable, 897,510, Sept. 1, 1908; Drew, 1,760,820, May 27, 1930; Krueger, 1,914,375, June 20, 1933.

The application discloses a method of and an apparatus for dispensing "in predetermined or measured quantities," sheet material, particularly tape having one of its surfaces coated with adhesive. The specification mentions the tape disclosed in the cited patent to Drew, which patent states, in substance, that the tape, apparently of paper, is of peculiar utility in masking portions of the surfaces of automobile bodies when paint is applied to such surfaces by spraying. Appellant describes the adhesive as a "pressure sensitive adhesive" and says in his specification that the adhesiveness is

"relied upon in a large degree to complete the function of the method and apparatus involved in this invention."

Before us, counsel for appellant emphasizes that feature of the claims expressed in claim 17, supra, by the clause reading,

"a roller for measuring the sheet material and to which said material is caused to adhere by the action of said coating while dispensing."

This feature is present in all the claims and is disclosed in the specification and drawings. The tape to be dispensed is in roll form and is placed upon a drum which serves as a carrier for the roll. As the tape is drawn from the roll it passes over a roller, referred to as a "measuring member," and then below a substantially horizontal metal member provided with a serrated edge for severing the tape at the point desired. The roller is equipped with apertures located adjacent its ends and spaced at any desired intervals. A pawl is provided for engaging the apertures and controlling the rotation of the roller, the pawl being mounted upon a spring lever. When the spring lever is pressed downwardly the pawl is disengaged from the roller. When the pressure upon the spring is released the pawl again contacts the roller and when it engages an aperture the operation ceases while the tape is severed. So, the length of the tape to be cut is determined by the distance between the apertures. By keeping the spring lever pressed downwardly, however, the tape may be drawn out to any length desired. It is stated at different places in the specification that the tape adheres to the roller or measuring member, and this adhesion is claimed to rotate the member as the tape is drawn by the hand of the operator. In view of the issue, it is unnecessary to state further details of the operation.

The Drew reference, as has been said, is alluded to in appellant's specification as disclosing a form of tape for the dispensing of which appellant's device is designed. The Krueger patent seems to have been cited with reference to certain of the claims which show a particular arrangement of the severing device. It discloses a device in which tape passes over a roller and is severed by means located adjacent the roller and above the tape being dispensed.

The principal reference is the patent to Anable. This patent is for a strip-serving device, seemingly paper strips either gummed or ungummed. When gummed paper is used means are provided for moistening the gum; when ungummed paper is used an adhesive is substituted for the water in the moistening device. The material from which the strips are to be served, or dispensed, is mounted upon a spindle. When pulled at the end the material unrolls from the roll, passes under a small guide roller and then between two rollers, designated in the drawing by the numerals 5 and 14, and thence under another small roller beyond which it passes over the moistening unit to the means whereby it is severed. Adjacent one end of the roller 5, and mounted on the same shaft is a toothed gear designated in the drawing by the numeral 7. Upon the face of roller 5 is a ratchet gear. A pawl mounted on the toothed gear cooperates with a ratchet gear to cause the roller 5 to rotate in a clockwise direction but permitting the toothed gear to rotate counter-clockwise without imparting movement to the roller 5 which is stated to be loosely mounted upon a horizontal shaft, which shaft is loosely journaled in the framing of the machine. Anable supplies a pair of levers upon one end of which, he states,

"is loosely mounted a roll 14 and also a gear 15, preferably of substantially equal diameter, the gear 15 being adapted to mesh with the gear 7 when the strip is drawn upon for use."

The Examiner held Anable's lower roller, 5, to be the measuring roller, saying that the contention on the part of appellant that the upper roller, 14, is such "is not in agreement with Anable's specification," and broadly held, in effect, as to all the claims, that "there would be no invention in dispensing the paper of Drew in Anable's machine."

The Board said:

If a sheet of material such as is shown by Drew be substituted in the Anable patent, it is believed that all of the present claims are met in all substantial respects.

Appellant argues that ambiguity exists in that part of Anable's specification which reads:

"I mount upon the framing a lever or pair of levers 13, upon one end whereof is loosely mounted a roll 14 *and also a gear 15.*" [Italics quoted from brief.]

Appellant insists that the italicized phrase is capable of an interpretation to mean that the gear 15 is loosely mounted upon the lever end as well as roller 14, but that, if this be the case, it results (for the reasons given in explaining the operation of the device) that Anable's disclosure is of an inoperative device. It is then said, with explanation of the operation of the parts, that to render the patent operative the upper roller, 14, becomes the measuring member rather than the lower roller, 5, and that, if this latter be the case, the measuring roller would not be operated by drawing upon the adhesive tape passing between it and the lower roller, but by the gear arrangement described.

The Board made no definite declaration as to which of Anable's rollers constituted the measuring roller, but we deduce from its decision that the

lower roller, 5, was so regarded. It is noted that the Examiner said, stating reasons therefor, "it is not believed it would be invention to dispense with the upper or pressure roller 14 of Anable."

In his brief the Solicitor for the Patent Office argues that appellant is entitled to rely only upon the feature of his measuring roller being rotated by drawing upon the adhesive tape (the sticky qualities of the tape affecting the rolling process) for patentability, and says that

"strictly speaking the tape dispensed is not legitimately a part of the structure for dispensing the tape. • • • The material operated upon by a machine or apparatus is not legitimately a part of the structure of such a machine or apparatus."

Authorities are cited.

As to this contention it seems sufficient to say that neither of the tribunals below rejected any of the claims upon this ground and we may not, therefore, consider it. *In re Bryson D. Horton*, 19 C. C. P. A. (Patents) 871, 54 F.(2d) 961, 418 O. G. 273,

The Board said:

In applicant's device, the sheet is guided in such a way that the tacky side of the sheet will be pressed against a considerable surface area of the roller as the sheet is drawn out. Thus there will be sufficient adhesion of the sheet to the roller so that it can control the dispensing of the sheet. This feature together with the means for limiting the movement of the roller, seem to be quite important to give a simple structure for dispensing this kind of a sheet. None of the claims contains these essential limitations. As broadly as the claims are drawn we fail to see that they distinguish over the prior art, particularly the Anable patent, for the reasons stated by the Examiner.

It would seem from this that had the *claims* defined the feature of controlling the operation of the roller by means of the tape together with the means for limiting the movement of the roller, with sufficient definiteness (as the specification apparently did) they might have been regarded as patentable.

In view of this expression of the Board, we have examined the limitation respecting this feature, as expressed in each of the claims, with great care, because Anable does not seem to us to teach any operating function of the measuring roller (whether it be the lower roller or the upper roller) by the tape itself. We do not find, however, that the claims at issue go any further than to claim the *adherence* of the tape to the measuring roller, and we think that if such tape were run through the Anable device there would of necessity be a certain amount of adherence.

Since certain claims stand allowed, it may be that if appellant discloses matter really patentable but not properly claimed, he may yet be permitted upon the return of the case to the Patent Office to amend by presenting new and proper claims. That, however, must be determined in the Patent Office and not by us in this proceeding.

In view of our conclusion upon the foregoing ground, which applies to all the claims, we need not discuss the second ground upon which the method claims were rejected.

The decision of the Board of Appeals is affirmed.

Affirmed.

HATFIELD, *J.*, did not participate in the decision of this case.

U. S. Court of Customs and Patent Appeals

CHAMPION SPARK PLUG COMPANY

v.

GLOBE-UNION MANUFACTURING COMPANY

No. 3,783. Decided March 29, 1937

[88 F.(2d) 970]

1. TRADE-MARKS—GEOGRAPHICAL—"GLOBE".

"We are of the opinion that the word 'Globe' is not merely a geographical name or term in the sense in which the phrase is used in the statute. A geographical name or term to our minds signifies a nation, state, county, city, municipality, river, lake or the like. The reasons for denying a trade-mark monopoly upon such names or terms is obvious, but 'Globe' has no such geographical significance; it identifies no particular geographical location, nor is its proper use as a trade-mark likely to interfere with or embarrass any public or private right."

2. SAME—SIMILARITY—"GLOBE" WITH ZIGZAG LINE REPRESENTING LIGHTNING THERETHROUGH AND A MARK CONSISTING OF A REPRESENTATION OF A TERRESTRIAL GLOBE HAVING A BROAD BLACK BAND WITH WHITE LINES ADJACENT ITS EDGES.

A mark consisting of the word "Globe" with a zigzag line representing a flash of lightning passing therethrough as applied to spark plugs *Held* so similar to a mark consisting of a representation of a terrestrial globe having a broad black band with white lines adjacent its edges and the word "Champion" printed thereon, running obliquely around it, previously registered to another for the same goods, as to be likely to cause confusion in trade.

APPEAL from the Patent Office. Reversed.

Mr. Charles W. Owen, Mr. Carl F. Schaffer, and *Messrs. Owen & Owen* for Champion Spark Plug Company.

Mr. John W. Michael and *Messrs. Lecher, Michael, Whyte & Spohn* for Globe-Union Manufacturing Company.

GARRETT, *J.*:

This is a trade-mark opposition proceeding which arose in the United States Patent Office following the publication of notice of appellee's application to register the word "Globe" with a zigzag line representing a flash of lightning drawn therethrough, for use upon spark-plugs for internal combustion engines. Beneath the notation appear the words "Full Spark", but these are disclaimed apart from the mark shown. Use is alleged since May 24, 1933. In the application it is said:

"The trade-mark is applied to the plugs by marking the same in ink upon the porcelain insulators prior to glazing and to the packages containing the plugs by printing or otherwise displaying said mark thereon."

Appellant filed notice of opposition. Testimony on behalf of opposer was taken and certain stipulations and exhibits were presented. The Examiner of Interferences sustained the opposition and held appellee not entitled to the registration sought. He also held *ex parte* that, regardless of the right of opposer to intervene, appellee was not entitled to registration because of two prior registrations issued to third parties. The Commissioner of Patents, acting through the Assistant Commissioner of Patents, reversed the decision upon both points and appellant took the instant appeal to this court.

In its notice of opposition, filed December 1, 1933, appellant alleged that the principal part of its business and that of its predecessors, had, for more than twenty-five years past, been the manufacture and sale of spark-plugs; that it had been its practice to sell products of the highest qualities, using therein only the best materials and workmanship; that as early as 1907 it adopted for use as a trade-mark a representation of the terrestrial globe; that it has continuously used such mark in interstate and foreign commerce; that more than nine million dollars have been expended for advertising; that it is the owner of registrations No. 92,949 of August 12, 1913, and No. 120,167 of January 15, 1918; that the public will be misled by the use by appellee of the mark it seeks to register into the belief that the goods originated with appellant, and that appellant believes it would be damaged by the registration to appellee.

The material points of appellee's answer will appear as the case is hereinafter discussed.

Appellant's registration of August 12, 1913, consists of a representation of the terrestrial globe, showing particularly the Western Hemisphere, and having a broad black band with white lines adjacent its edges running somewhat obliquely around it near its center. The registration of January 15, 1918, shows a somewhat similar figure with the word "Champion" printed upon the band. Both marks are for spark-plugs, the latter also naming spark-plug porcelains and parts.

Mr. Robert A. Stranahan, president of appellant company and long associated with its predecessors, was called as a witness on its behalf. The material parts of his testimony are to the effect that the mark embraced in registration No. 120,167, which carries the word "Champion" on the band, is and has been most commonly used in its advertisements, upon its letter heads and upon the containers in which the spark-plugs are shipped; that he did not think the company had ever used the mark embraced in registration No. 92,909 without the word "Champion" displayed on the band; that for something less than a year the globe representation (with, as we understand his testimony, "Champion" on the band) was stamped directly upon the plugs but that this was abandoned, not being satisfactory, and the custom has since been to stamp the plug with only the word "Champion"; that the globe representation is included in most of its advertising, although exceptions were shown on cross-examination; that about 20 per cent of appellant's business is direct with manufacturers of automobiles, the other being with jobbers and dealers; that the purchaser of a new car equipped with appellant's spark-plugs would see only the word "Champion" thereon; that appellant's products are known the world over as "Champion" spark-plugs; that they are not known, or referred to by the trade or the public, nor advertised by the company, by the name "Globe", and that he had no proof of any actual confusion, no attempt having been made to investigate that matter.

During cross-examination the witness was confronted with another registration by appellant, No. 92,950, of August 12, 1913. It consists simply of the word "Champion", registered for use on spark-plugs.

Upon the state of facts above outlined, it is insisted by appellee that appellant may not place any reliance upon the representation of the globe with band alone as shown in its registration No. 92,949 of August 12, 1913, because it is shown never to have been used in that form, and that in this proceeding cognizance may be taken, so far as the pleadings are concerned, of only registration No. 120,167 wherein the word "Champion" is printed upon the band surrounding the figure of the globe.

Much of the argument on behalf of appellee is directed to the point that "the representation of a globe of the world per se" is

"merely and exclusively geographical and descriptive in meaning, character, and significance,"

and hence, it is urged, that

"the question of likelihood of confusion presented under the issues of this case is not determinable upon those authorities which deal with word and picture alternatives • • •."

It is further insisted that the word "Globe" is not merely geographical in character because its meaning embraces many things in addition to the terrestrial globe, but it is said, in substance, that even if a geographical significance be assigned to the word, the mark of appellee is, like that of appellant, a composite one and includes other features rendering it registrable in its entirety.

Upon the question of descriptiveness of either the word "Globe", or a pictorial or diagrammatic representation of a globe, we need not dwell. Obviously, neither is descriptive of spark-plugs or of the character or quality of spark-plugs.

Upon the question of geographical "meaning", it is well to quote the pertinent language of the second proviso of section 5 of the Trade-Mark Registration Act of February 20, 1905. This reads:

Provided, That no mark which consists • • • in • • • merely a geographical name or term, shall be registered under the terms of this act.

[1] We are of the opinion that the word "Globe" is not merely a geographical name or term in the sense in which the phrase is used in the statute. A geographical name or term to our minds signifies a nation, state, county, city, municipality, river, lake or the like. The reasons for denying a trade-mark monopoly upon such names or terms is obvious, but "Globe" has no such geographical significance; it identifies no particular geographical location, nor is its proper use as a trade-mark likely to interfere with or embarrass any public or private right.

The same reasoning leads to the conclusion that a figure of the globe representing the earth is not, in the sense of the statute, a representation of merely a geographical name or term; it is of the terrestrial body. "There are also celestial bodies, and bodies terrestrial, • • •." The Congress, in the Trade-Mark Registration Act, did not ban the celestial, nor the terrestrial, but stopped with geographical names and terms. The principle applied in the case of *In re Canada Dry Ginger Ale, Inc.* (No. 3698), 24 C. C. P. A. (Patents) —, 86 F.(2d) 830, 479 O. G. 519, 32 U. S. P. Q. 49, wherein a map of

Canada was held to represent, or be the equivalent of, a merely geographical name or term, is not, in our view, apposite here, and so of other authorities cited upon this point by counsel for appellee.

We are of opinion that the question to be considered is simply that of whether confusion is likely to result from the use of appellant's mark containing as a part thereof a figure of the terrestrial globe and the word "Globe" crossed by a zigzag line as described.

That the word "Globe" has a broader meaning than that of a figure of the terrestrial globe is clear. The primary definition of the word given by Webster's New International Dictionary is:

"A round or spherical body, solid or hollow; a body whose surface is in every part equidistant from the center; a ball; a sphere."

The same authority informs us that the word is derived from the Latin word *globus*, a word which existed, according to history, long before the somewhat globular shape of the earth was known.

Nevertheless we think it true that whenever the simple word "globe" is used, the first impression made upon the mind is that of the commonly accepted idea as to the shape of the earth. Instinctively and subconsciously that is the primary meaning which the mind attaches to the word. Such being the case, we are of the opinion that the figure is an alternative, or practical equivalent, of the word, and hence the general rule relative to words and pictorial alternatives must be here considered. Numerous authorities might be cited, but we content ourselves with a reference to the companion cases of *Derby Oil Co.* v. *White Star Refining Co.*, 20 C. C. P. A. (Patents) 816 and 820, 62 F.(2d) 984 and 987, 429 O. G. 75, with the authorities therein cited. These cases serve also as authorities upon the question of public juris suggested by appellee during the prosecution of the instant case.

[2] It may be, indeed it seems to be, a fact that appellant's spark-plugs are practically always referred to by the name "Champion" and never by the name "Globe", but this does not alter the other fact that a figure of the terrestrial globe is a prominent part of appellant's mark which was registered and used upon its cartons and in connection with much of its advertising prior to the time of any claimed use of the word "Globe" by appellee. It does not seem to us to be material whether or not appellant has practically abandoned use of the figure of the globe alone. The figure is retained in, and is a conspicuous part of, the mark which it did register and use in the manner indicated. That there is room for confusion seems obvious and, in our opinion, there is sufficient doubt with respect to likelihood of confusion to require application of the rule against appellee as a newcomer in the field.

It is unnecessary to discuss the *ex parte* ground of rejection.

We hold that the opposition should be sustained and appellee denied the registration sought.

Accordingly, the decision of the Commissioner of Patents is reversed.

Reversed.

HATFIELD, *J.*, did not participate in the decision of this case.

U. S. Court of Customs and Patent Appeals

DOYLE *v.* JOHN MORRELL & COMPANY

No. 3,791. Decided March 29, 1937

[88 F.(2d) 721]

TRADE-MARKS—SIMILARITY—"STRONGHEART" AND "RED HEART".

The marks "Strongheart" and "Red Heart" used as trade-marks for dog and cat foods *Held* confusingly similar.

APPEAL from the Patent Office. Affirmed.

Messrs. Jackson & Webster, *Mr. Chas. R. Allen*, and *Mr. W. G. Mackay* for Doyle.

Messrs. Mason, Fenwick & Lawrence, *Mr. Edward T. Fenwick*, and *Mr. Edward G. Fenwick* for John Morrell & Company.

GARRETT, *J.*:

Appellant on October 11, 1932, filed application for registration in the United States Patent Office of the word "Strongheart" as a technical trade-mark for use on dog and cat food, alleging the word to have been continuously used for that purpose since July 18, 1932. After notice of the application had been published in the Official Gazette of the Patent Office appellee filed notice of opposition to such registration, alleging a belief that it would be damaged for the reason that the mark

"'STRONGHEART' will cause confusion with the mark owned and controlled by the opposer, which mark 'RED HEART' and the picture of a heart, has been used upon dog and cat food and kindred products, since long prior to July 18, 1932."

The Examiner of Interferences sustained the opposition and adjudged appellant not entitled to the registration. Upon appeal the Commissioner affirmed the decision of the Examiner of Interferences, and the instant appeal to this court followed.

In the notice of opposition appellee plead various registrations (some being renewals) ranging in date from October 17, 1899, to October 7, 1930. It is unnecessary to describe these registrations in detail. Some are simply heart-shaped symbols, the drawings showing lines to indicate that they are printed in solid red. One has the notation "Heart Brand" stamped upon the symbol. Another is stamped "Morrell's Red Heart." One is for the words "Red Heart" unaccompanied by other features. The goods for use upon which the several registrations were sought and obtained covered a wide variety of animal products and the record establishes appellee's use prior to appellant's filing date, and prior to any date claimed by appellant for use of "Strongheart," of its heart mark in some form as a trade-mark for dog and cat foods.

As the issue comes to us the only question to be determined is that of likelihood of confusion in trade by reason of the similarity of the marks. Upon this we think there is small room for doubt. Heart is unquestionably a prominent, we think the dominant, part of both marks. It is argued on behalf of appellant that "Strongheart" was the name of a dog which, before it was gathered to its fathers several years ago, had attained great fame as a cinema actor, and it is said, although we find no testimony upon this point, that the picture of a dog's head used in connection with appellant's mark is that of this noted animal, it being urged that this somehow affects the question of confusion. It may be said that appellee uses pictures of different breeds of dogs on its cartons. These pictures, however, being no part of the marks, are not of particular importance in this statutory proceeding. We have simply compared the naked marks with each other, and from the comparison, it seems to us unquestionable that there is likelihood of confusion in trade from their use upon identical goods.

The decision of the Commissioner of Patents is affirmed.

Affirmed.

HATFIELD, *J.*, did not participate in the decision of this case.

U. S. Court of Customs and Patent Appeals

THE KROGER GROCERY & BAKING COMPANY

v.

THE BLUE EARTH CANNING COMPANY

No. 3,775. Decided March 29, 1937

[88 F.(2d) 725]

TRADE-MARK—SIMILARITY—"COUNTRY KIST" AND "COUNTRY CLUB."

The mark "Country Kist" as applied to canned vegetables *Held* confusingly similar to "Country Club" as applied to the same goods.

APPEAL from the Patent Office. Reversed.

Mr. A. Yates Dowell for The Kroger Grocery & Baking Company.

Messrs. Semmes & Semmes, *Mr. Harry H. Semmes*, and *Mr. S. Warwick Keegin* for The Blue Earth Canning Company.

LENROOT, *J.*:

This is a trade-mark opposition proceeding. The involved marks are "Country Club", used by appellant, and "Country Kist", used by appellee. Both marks are applied to identical goods, viz, canned vegetables.

Appellee, on March 22, 1932, applied for registration, under the Trade-Mark Act of February 20, 1905, of the mark "Country Kist", for use on canned vegetables, and in its application stated that the mark had been so used since on or about February 1, 1928.

On December 7, 1932, appellant filed notice of opposition to appellee's application and alleged prior adoption and registration of the mark "Country Club", applied to canned vegetables, and use of said mark thereon by it and its predecessors in business since 1883. Appellant's ground of opposition was the allegedly confusing similarity of the involved marks, to the damage of appellant.

Appellee answered, denying the confusing similarity of the marks and damage to appellant by the use by appellee of its mark.

Both sides took testimony. But one issue was raised before the Patent Office tribunals, viz, that of confusing similarity of the marks, and that is the only issue before us, for it is conceded that appellant was the user of the mark "Country Club" prior to use by appellee of its mark "Country Kist".

The Examiner of Trade-Mark Interferences held that the likelihood of confusion in trade in the two marks was "reasonably doubtful" and therefore, in accordance with the well established rule resolved such doubt against the newcomer, appellee, and sustained the opposition.

The Commissioner of Patents reversed the decision of the Examiner and held there was not reasonable likelihood of confusion in the use of the marks of the respective parties. From the decision so rendered, this appeal was taken.

The Commissioner in his decision stated:

• • • considering the marks here involved I find no difficulty in holding that they are not confusingly similar. Both are of such a nature that the whole of each must be read or pronounced in order to convey any definite meaning. "Country Club", in the abstract, describes a particular type of club, and connotes sophistication, exclusiveness and smartness. "Country Kist", on the other hand, suggests rural freshness and native simplicity. In other words, the mental pictures associated with the two expressions are almost exactly opposite. Moreover, the appearance and the sound of the marks as a whole are, in my opinion, sufficiently different to insure against any reasonable likelihood of confusion.

The Commissioner seems to have rested his decision primarily upon the difference in significance of the marks, although he also held that in appearance and sound they were sufficiently different to avoid likelihood of confusion. He also found that the fact that there was no evidence of actual confusion was a persuasive circumstance indicating that no confusion exists, and that none is likely to occur.

Counsel for both parties take the position that the word "Country" found in each of the marks is not descriptive, but only suggestive. Appellee's counsel points out that the words "Country Club" suggest the excellence of the goods, appealing to sophisticated people, with special emphasis upon the word "Club", while appellee's mark suggests the attractive features of life upon the farm.

We agree that the significance of the two marks, taken as a whole, is different, and if the test of likelihood of confusion was significance alone, we would agree that the opposition should be dismissed. Indeed, if a purchaser examined the marks sufficiently closely to form a mental picture of the suggestiveness of each, as indicated by the Commissioner, he would at the same time observe that there was a difference in the marks themselves and would not be likely to be confused. But significance of marks is not the only factor to be considered, for appearance and sound are equally important.

The marks of both parties are applied to canned vegetables, goods that are cheap in price and of every day use. In the case of *Lever Bros.* v. *Riodela Chemical Co.*, 17 C. C. P. A. (Patents) 1272, 41 F.(2d) 408, 398 O. G. 356, we said of the goods there involved:

It must be remembered that the goods to which the marks are applied are of common every day use in the household. They are very inexpensive and are consumed

in their use. Purchasers therefore would not be expected to exercise such degree of care in their purchase as would be exercised in more expensive and rarely purchased articles. • • •

What was there said is true in the case at bar; and, having this in mind, we think that the ordinary purchaser, seeing a can of peas upon the shelf of a grocery store with the mark "Country Kist" applied thereto, and being familiar with appellant's mark, might very likely be confused, giving particular attention only to the word "country" without giving thought to the other word of the mark of either appellant or appellee.

It is admitted by appellee that, at the time it adopted the mark "Country Kist", its officers were familiar with appellant's mark "Country Club", applied to identical goods, but witnesses connected with appellee testified that it never occurred to them that there would be likelihood of confusion with appellant's mark, arising from the use of the mark "Country Kist". Accepting the view that there was no motive upon the part of appellee's officers in adopting its mark to profit by the extensive business of appellant in the use of its mark "Country Club", we would observe that appellee had an unlimited field from which to select a trade-mark, and there was no just reason for selecting one which so nearly resembled that of appellant, with which appellee was familiar. When appellee's officers did select the mark here involved, they did so at their peril, and they should have known that, even though they believed that the mark selected would not infringe the mark of appellant, the Patent Office tribunals and the courts might come to a different conclusion.

We have little sympathy with those who adopt marks having a close resemblance to the trade-marks of others, with which they are familiar, used upon goods of the same descriptive properties, even though they be of the opinion that they are not confusingly similar. One who adopts a valid mark and establishes a large business in which the mark is used should have all doubts resolved in his favor as against newcomers in an opposition proceeding. *The Procter & Gamble Co.* v. *J. L. Prescott Co.*, 18 C. C. P. A. (Patents) 1433, 49 F.(2d) 959, 413 O. G. 1105.

The Commissioner stated that the fact that appellant had produced no evidence of actual confusion between the marks of the parties was persuasive evidence that no confusion exists and that none is likely to occur. It is so well established as to require no citation of authority that an opposer, in order to succeed, is not required to produce evidence of actual confusion. Likelihood of confusion may be determined by consideration of the goods to which the marks are applied and a comparison of the marks involved. *Apex Electrical Mfg. Co.* v. *Landers, Frary & Clark*, 17 C. C. P. A. (Patents) 1184, 41 F.(2d) 99, 398 O. G. 708.

For the reasons stated herein, the decision of the Commissioner is reversed.

Reversed.

HATFIELD, *J.*, did not participate in this decision.

U. S. Court of Customs and Patent Appeals

MCKINNON *v.* HYVIS OILS, INC.

No. 3,786. Decided March 29, 1937

[88 F.(2d) 699]

1. TRADE-MARKS—DISCLAIMER—ESTOPPEL.
   A statement in the certificate of registration of the mark "HyVis" as applied to lubricating oils that it is not intended to cover any established commercial term does not estop the registrant from asking for the cancellation of the mark "Highpres" as applied to the same goods, since that statement is not a true disclaimer for the reason that it does not disclaim any part of the mark "HyVis" and clearly does not embrace "Highpres" which is not an established commercial term (*Warner-Patterson* v. *Malcomb*, 17 C. C. P. A. 984, 1930 C. D. 383, distinguished).
2. SAME—SIMILARITY—"HIGHPRES" AND "HYVIS".
   The terms "Highpres" and "HyVis" as applied to lubricating oils *Held* confusingly similar.

APPEAL from the Patent Office. Affirmed.

Messrs. Cushman, Darby & Cushman, Mr. Arlon V. Cushman, and *Mr. William M. Cushman* for McKinnon & Company.

Mr. Watts T. Estabrook, Messrs. Evans & McCoy, and *Mr. Frank S. Greene* for HyVis Oils, Inc.

LENROOT, *J.*:

This is a trade-mark cancellation proceeding under the provisions of section 13 of the Trade-Mark Act of February 20, 1905.

On October 15, 1929, appellant's predecessor, Petroleum Products Storage Company, secured registration of the mark "Highpres", No. 262,583, used on lubricating oils.

On July 6, 1934, appellee filed its petition for the cancellation of said registration, alleging ownership of the mark "HyVis", used on lubricating oils and greases, and registration of the same to its predecessor and assignor, the Fred G. Clark Company, on October 26, 1920, registration No. 135,948. Appellee alleged use of its mark prior to the use of appellant's mark, and that appellant's mark is deceptively similar to the mark of appellee, and for that reason has injured the business of appellee.

The registration certificate of appellee's mark contains the following:

The undersigned, The Fred G. Clark Co., applicant in the above entitled case, hereby disclaims right to the exclusive use of the terms "High-Viscosity"; "H-Vis"; "Vis-H"; and "H-V", as the mark "Hyvis" which constitutes the subject matter of the above application is not intended to cover any established commercial term.

Appellant answered said petition for cancellation, denying that the marks of the respective parties are confusingly similar, and denying that appellee has been damaged by the use by appellant of its mark "Highpres".

No testimony was taken, but the matter was submitted upon a stipulation of facts, from which it appears that appellant concedes that appellee and its predecessor used the mark "HyVis" upon lubricating oils prior to the use by appellant of its mark; that appellee is now the owner of said mark "HyVis"; that at the time appellant's predecessor secured registration of the mark "Highpres" said predecessor knew of the use of the mark "HyVis" upon motor oils, and in 1928, as bailee, stored HyVis oils in its storage plant at Memphis, Tenn.

The Examiner of Trade-Mark Interferences held that, by reason of the disclaimer in the HyVis trade-mark registration, hereinbefore quoted, appellee is estopped from claiming that the mark of appellant is confusingly similar to the mark of appellee, and further found that in the use of the two marks confusion in trade is not reasonably likely. Accordingly, he held that appellee's petition for cancellation be dismissed.

Upon appeal, the Commissioner of Patents reversed the decision of said Examiner and granted the petition for cancellation. From this decision of the Commissioner, appellant took the appeal now before us.

In his decision the Commissioner held that the disclaimer of the HyVis registration embraced only the notations expressly stated therein and any established commercial term, and did not embrace the term "Highpres"; that our decision in the case of *Warner-Patterson Co.* v. *Malcomb*, 17 C. C. P. A. (Patents) 984, 39 F.(2d) 274, 397 O. G. 170, relied upon by the Examiner, has no application to a state of facts such as is here involved because the mark "HyVis" was not disclaimed, and that, as the two marks are used upon identical goods, they are confusingly similar. He stated:

• • • The goods involved are practically always bought by word of mouth and the similarity of sound between the two words is therefore of paramount importance. That "HyVis" and "Highpres" sound alike cannot be denied. Under the circumstances I believe that the petitioner has shown the kind and amount of damage required by the statutes, and that the relief prayed for should be granted.

[1] We are in agreement with the conclusion reached by the Commissioner. We do not think that the purported disclaimer in the HyVis registration is a true disclaimer for the reason that it disclaims no part of the HyVis mark; but even if it be treated as a disclaimer, it clearly does not embrace the term "Highpres", for such term was not an established commercial term.

The case of *Warner-Patterson Co.* v. *Malcomb*, supra, was a trade-mark interference proceeding. Appellant had secured the registration of the mark "Liquid Solder" for a radiator sealing compound. Appellee made application to register the mark "Cy's Liquid Solder". It appeared that appellee's predecessor had applied for the registration of the mark "Cy's Liquid Solder", which registration was refused upon the ground that the words "Liquid Solder" were descriptive of the merchandise to which the mark was applied, whereupon applicant disclaimed the use of the words "Liquid Solder" apart from the mark shown. It will readily be seen that our holding in that case, that the disclaimer created an estoppel, has no application to the facts in the case at bar.

[2] It is our opinion that the marks "Highpres" and "HyVis", applied to lubricating oils, are confusingly similar, especially in sound. It is true, as argued by counsel for appellant, that the marks are different in significance, and also differ in appearance; but in sound they are very similar, and we think that a purchaser of motor lubricating oils would be very likely to be confused by the similarity of the marks. The most that can be said in favor of appellant's contention is that likelihood of confusion is doubtful, and under the well-established rule such doubt should be resolved against the newcomer, which in this case is the appellant.

Both parties in their briefs have cited cases in this and other courts with respect to specific trade-marks in support of their respective contentions upon the question of similarity of the marks here involved, but we find little aid in these cases in determining the question here involved, for the reason that the question of confusion or lack of it must be determined from the marks involved and the goods to which they are applied in each particular case.

While it is true that there are three factors to be considered in passing upon similarity of marks, viz., meaning, appearance, and sound, it does not follow that confusion can be found to be likely only where a combination of these factors exists, but sound alone or appearance alone may be sufficient to create likelihood of confusion. *Cluett, Peabody & Co., Inc.*, v. *Wright*, 18 C. C. P. A. (Patents) 937, 46 F.(2d) 711, 406 O. G. 851.

We find no error in the decision of the Commissioner, and it is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

IN RE SIBLEY

No. 3,790. Decided April 5, 1937

[88 F.(2d) 964]

PATENTABILITY—COATING COMPOSITION AND PROCESS OF PREPARING.
   Claims for a coating composition and process of preparing *Held* patentable over the prior art.

APPEAL from the Patent Office. Reversed.

BLAND, *J.*, dissenting.

Messrs. Williams, Rich & Morse, Mr. Henry D. Williams, Mr. Giles S. Rich, and *Mr. Albert H. Kirchner* for Sibley.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

LENROOT, *J.*:

This is an appeal from a decision of the Board of Appeals of the United States Patent Office, affirming a decision of the Examiner rejecting, for want of patentability over the cited prior art, claims 1, 3, 6 to 10, inclusive, 12, and 15 to 26, inclusive, of appellant's application. No claims were allowed.

Claim 25 is illustrative of the claims before us and reads as follows:

25. The improvement in the manufacture of coating compositions which comprises mixing the composition containing a drying oil with a positive oxidation catalyst and a controller of oxidation thereof comprising the condensation product of p,p' diamino diphenyl methane with beta naphthol.

The references cited are: Ostwald et al. (Brit-

ish), 10,361, April 20, 1911; Vanderbilt Co., Inc. (British), 269,840, January 9, 1928; Naugatuck Chemical Company (British), 342,502, February 5, 1931; Imperial Chemical Industries, Ltd. (British), 358,472, October 5, 1931; Merkle, 1,829,999, November 3, 1931; Goodyear Tire & Rubber Co. (British), 364,092, December 23, 1931; Sloan, 1,940,824, December 26, 1933; J. Soc. Chem. Ind. Japan, vol. 33 (1930), pp. 129-B–130-B; J. Ind. & Eng. Chem. (Smith), 1926, pp. 691–693; Rubber Age, vol. 20, 1926, pp. 27 and 30; Powell, 1,672,657, June 5, 1928.

The alleged invention is described in appellant's brief as follows:

The coating composition is a paint or varnish made with a drying oil as one of its principal constituents. In the case of paints, this oil acts as the carrier of the pigment. The "drying" of such a coating is an oxidizing process. The positive oxidation catalyst, commonly called a "dryer", functions to speed up this oxidation, causing rapid drying. Rapid drying is desirable but if the oxidation which produces it is not interrupted after progressing to a sufficient degree to produce a durable coating, it will hasten the disintegration, cracking or peeling of the coating.

The controller of oxidation is therefore included to arrest the oxidation after drying has reached the desired point. This controller acts as a negative oxidation catalyst which corrects the faults of the positive oxidation catalyst. The controller, or negative oxidation catalyst, is also called an "anti-oxidant", an "oxidation inhibitor" or a "negative catalyst." Its inclusion in the coating permits it to dry rapidly but overcomes the undesirable effects produced by the dryer.

Thus the coating contains two substances, a positive oxidation catalyst and an inhibitor, which is a negative oxidation catalyst, the first promoting oxidation to produce rapid drying and the second restraining oxidation after it has progressed sufficiently. The result is a paint or varnish which dries quickly and thereafter has marked resistance to disintegration, cracking or peeling.

The Board of Appeals in its decision stated:

The points raised by this appeal are similar to those raised in connection with appellant's application No. 593,198, which is being concurrently considered and decided.

The claims of this application are directed to specifically different anti-oxidants. The questions of analogy raised in this application are substantially the same as those raised in connection with the copending application and reference may be had to the decision in that case for our views thereon.

The application, No. 593,198, referred to in the above quotation, is the subject of Patent Appeal No. 3789, *In re Sibley*, decided concurrently herewith. 24 C. C. P. A. (Patents) —, 88 F.(2d) 900.

In the brief of the Solicitor for the Patent Office we find the following:

The issue in the instant appeal is broadly the same as that involved in the companion appeal but specifically the issue in the instant appeal is different from the issue in the companion appeal and a different set of references are relied upon in the instant case.

Broadly the issue in each of the two appeals is whether the ancillary references taken in connection with the disclosure of the Merkle patent are sufficient to negative patentability. In the companion appeal No. 3789 one specific anti-oxidant is claimed which the patent to Merkle does not mention and the issue in that appeal is whether the references which are cited disclosing the use of that particular anti-oxidant are sufficient to negative patentability of the subject-matter there claimed.

In the instant appeal a specifically different anti-oxidant is claimed and here, as in the companion appeal, the patent to Merkle does not mention this specific anti-oxidant. However, the ancillary references upon which the Examiner relied disclose the use of this specific anti-oxidant as claimed by appellant, in connection with the rubber art, and the question here presented for decision is whether the teaching of these references is sufficient to negative patentability in the subject-matter of the appealed claims.

Thus it will be seen that, although a specifically different anti-oxidant is here claimed than was claimed in appeal No. 3789, the real issue in the two cases is the same, viz, whether the use of specific anti-oxidants in the rubber art, shown in some of the references, negatives patentability of the claims here involved. In appeal No. 3789 this was fully discussed and we came to the conclusion that the Board of Appeals erred in holding that the use of specific anti-oxidants in the rubber art negatives patentability of the use of such anti-oxidants in the drying oil art. The only difference between the case before us and that of appeal No. 3789 is in the use of different anti-oxidants; but here, as in appeal No. 3789, the use of such anti-oxidants disclosed in the references was limited to the rubber art.

Inasmuch as our opinion in appeal No. 3789 fully discusses this subject, it is unnecessary for us further to discuss it here. It is clear that our decision in appeal No. 3789 controls our decision here.

For the reasons stated, the decision of the Board of Appeals is reversed.

Reversed.

T. M. 283,831 (*a*), Dr. Miles Medical Co., Anti-acid effervescent preparations, D. C., N. D. Ill., Doc. 14569, *Dr. Miles Laboratories, Inc.*, v. *C. Honoroff (Honoroff Laboratories)*. Order restraining use of plaintiff's mark Nov. 30, 1936.

T. M. 283,831 (*b*), Dr. Miles Medical Co., Anti-acid effervescent preparations, filed Sept. 13, 1937, D. C., N. D. Ill., Doc. 15771, *Miles Laboratories, Inc.*, v. *Continental Sales Corp. et al.*

Adjudicated Patents

(C. C. A. N. Y.) Lowenstein patent, No. 1,231,764, for telephone-relay, claims 1, 2, 4, 5, 6, and 7 *Held* valid and infringed. *Western Electric Co.* v. *General Talking Pictures Corporation*, 91 F.(2d) 922.

(C. C. A. N. Y.) Arnold patent, No. 1,329,283, for thermionic amplifier, claims 7, 10, and 13 *Held* valid. *Id.*

(C. C. A. Ill.) Spangler patent, No. 1,349,010, for wick cleaner and shaper, claim 8 *Held* not infringed. *Mantle Lamp Co. of America* v. *Montgomery Ward & Co.*, 91 F.(2d) 872.

(C. C. A. N. Y.) Wachsman patent, No. 1,358,483, for stop mechanism for knitting machines, claims 1 to 3 *Held* not infringed. *Wachsman* v. *Wachsman*, 91 F.(2d) 929.

(C. C. A. N. Y.) Ruthven patent, No. 1,374,954, for electro-magnetic train-control and danger-indicating means and recording means, claim 4 *Held* not infringed. *Union Simplex Train Control Co.* v. *General Ry. Signal Co.*, 91 F.(2d) 950.

(C. C. A. N. Y.) Arnold patent, No. 1,403,475, for vacuum-tube circuits, claims 8, 9, and 10 *Held* valid and infringed. *Western Electric Co.* v. *General Talking Pictures Corporation*, 91 F.(2d) 922.

(C. C. A. N. Y.) Pacz patent, No. 1,410,499, for metal and its manufacture, claims 25 to 27 *Held* invalid. *General Electric Co.* v. *Wabash Appliance Corporation*, 91 F.(2d) 904.

(C. C. A. N. Y.) Mathes patent, No. 1,426,754, for circuits for electron-discharge devices, claim 8 *Held* valid. *Western Electric Co.* v. *General Talking Pictures Corporation*, 91 F.(2d) 922.

(C. C. A. N. Y.) Arnold patent, No. 1,448,550, for thermionic amplifier circuits, claims 1 and 12 *Held* valid and infringed. *Id.*

(C. C. A. N. Y.) Arnold patent, No. 1,465,332, for vacuum-tube amplifier, claims 1, 3, 5, 8, 10, and 11 *Held* valid and infringed. *Id.*

(C. C. A. N. Y.) Ruthven patent, No. 1,470,107, for combination automatic and manually-operable airbrake power control and alarm system, claim 11 *Held* void. *Union Simplex Train Control Co.* v. *General Ry. Signal Co.*, 91 F.(2d) 950.

(C. C. A. N. Y.) Hill patent, No. 1,513,172, for apparatus and process for removing noncontinuous condensable gases, *Held* invalid. *Waddell* v. *Eastman Kodak Co.*, 91 F.(2d) 980.

(C. C. A. N. Y.) Arnold patent, No. 1,520,994, for electron-discharge amplifier, claims 1 and 4 *Held* valid. *Western Electric Co.* v. *General Talking Pictures Corporation*, 91 F.(2d) 922.

(C. C. A. Okla.) Prout patent, No. 1,582,224, for sucker-rod hanger, claims 1 to 4 *Held* valid, but not infringed. *Ratigan* v. *Deckard Supply Co.*, 91 F.(2d) 722.

(C. C. A. Ill.) Butler patent, No. 1,593,791, for lubricating apparatus, claim 2 *Held* valid and infringed. *Lincoln Engineering Co. of Illinois* v. *Stewart-Warner Co.*, 91 F.(2d) 757.

(C. C. A. N. Y.) Parkinson patent, No. 1,834,070, for heating device, claim 4 *Held* invalid and claim 6 *Held* not infringed. *Parkinson Heating Corporation* v. *Goldenstein*, 91 F.(2d) 968.

(C. C. A. N. Y.) Evans patent, No. 1,892,426, for method of and means for permanently waving hair, claims 1, 2, 4, 7, and 8 *Held* invalid and not infringed. *Zotos Corporation* v. *Rader*, 91 F.(2d) 935.

(C. C. A. N. Y.) Evans patent, No. 1,894,032, for method of and means for permanently waving hair, claims 1 to 6, inclusive, *Held* invalid and not infringed. *Id.*

(C. C. A. Ill.) Clarkson patent, No. 1,904,355, for power loader, *Held* valid but not infringed. *Indiana & Illinois Coal Corporation* v. *Clarkson*, 91 F.(2d) 717.

(C. C. A. N. Y.) Evans patent, No. 1,919,690, for method of and means for permanently waving hair, claims 25 to 34, inclusive, *Held* invalid and not infringed. *Zotos Corporation* v. *Rader*, 91 F.(2d) 935.

(C. C. A. Ill.) Davis reissue patent, No. 18,061, for blue flame mantle lamps, claims 18, 37, 38, 40 and 41 *Held* not infringed. *Mantle Lamp Co. of America* v. *Montgomery Ward & Co.*, 91 F.(2d) 872.

(C. C. A. N. Y.) Wachsman reissue patent, No. 19,069, for stop mechanism for knitting machines, claims 1 to 3, 5, and 8 to 10 *Held* invalid. *Wachsman* v. *Wachsman*, 91 F.(2d) 929.

(D. C. N. Y.) Slayter reissue patent, No. 19,929, for method of heat insulating, *Held* valid and infringed. *Slayter & Co.* v. *U. S. Insulation Corporation*, 20 F. Supp. 376.

Disclaimers

1,959,387.—*Harry Ernest Rubens*, Chicago, Ill. CIRCUIT CONTROLLER. Patent dated May 22, 1934. Disclaimer filed October 23, 1937, by the patentee.

Hereby enters this disclaimer to claims 18 and 19 of said Letters Patent.

2,075,456.—*Heinrich Neresheimer* and *Anton Vilsmeier*, Ludwigshafen-on-the-Rhine, Germany. COMPOUNDS OF THE DIBENZANTHRONE SERIES. Patent dated March 30, 1937. Disclaimer filed November 5, 1937, by the assignee, *General Aniline Works, Inc.*

Hereby disclaims from the scope of claim 1 those compounds corresponding to the recited formula, wherein both X and Y stand for hydrogen.

TRADE-MARKS

OFFICIAL GAZETTE, NOVEMBER 23, 1937

[VOL. 484. No. 4]

The following trade-marks are published in compliance with section 6 of the act of February 20, 1905, as amended March 2, 1907. Notice of opposition must be filed within thirty days of this publication.

Marks applied for "under the ten-year proviso" are registrable under the provision in clause (b) of section 5 of said act as amended February 18, 1911.

As provided by section 1 of said act, a fee of ten dollars must accompany each notice of opposition.

CLASS 1

Raw or Partly Prepared Materials

Ser. No. 390,908. GERMAIN SEED AND PLANT COMPANY, Los Angeles, Calif. Filed Apr. 3, 1937.

PRINCESS ELIZABETH

For Flower Seeds—Namely, Sweet Pea and Flower Garden Mixture.
Claims use since Jan. 25, 1937.

Ser. No. 391,916. HARRY W. KAYLOR, Hagerstown, Md. Filed Apr. 27, 1937.

Ayr

For Diatomaceous Silica.
Claims use since Jan. 1, 1928.

Ser. No. 396,529. CELLULOID CORPORATION, Newark, N. J. Filed Aug. 18, 1937.

AMER-GLO

For Plastic Material in the Form of Sheets, Foils, Films, Rods, and Tubes Suitable for Use in the Manufacture of Ornamental and Decorative Articles or Surfaces.
Claims use since July 2, 1937.

Ser. No. 397,786. ABRAMS & LINDEN, INC., New York, N. Y. Filed Sept. 25, 1937.

BABY-BEAVER

No claim is made to the words "Baby-Beaver" and "Quality".
For Fur Skins.
Claims use since July, 1936.

Ser. No. 397,789. BENNETT INCORPORATED, Cambridge, Mass. Filed Sept. 25, 1937.

BENITE

For Paper Filler or Powdered Papermaking Ingredient.
Claims use since Sept. 1, 1937.

Ser. No. 398,048. LOCKPORT COTTON BATTING CO., Lockport, N. Y. Filed Oct. 2, 1937.

Land O'Mod

For Dry-Goods Cotton-Batts.
Claims use since June 10, 1937.

CLASS 2

Receptacles

Ser. No. 394,578. CLAIROL, INC., New York, N. Y. Filed June 28, 1937.

CLAIROL

For Bowl or Receptacle Adapted for Use in the Mixing of Dyes Intended To Be Applied to the Hair.
Claims use since Dec. 26, 1934.

CLASS 3

Baggage, Animal Equipments, Portfolios, and Pocketbooks

Ser. No. 396,238. RESNICK BROS. LADIES HANDBAGS, INC., New York, N. Y. Filed Aug. 10, 1937.

The words "Soft Glove Feeling" are disclaimed except as used with the balance of the mark.
For Ladies' Hand Bags.
Claims use since Feb. 1, 1937.

Ser. No. 397,131. WM. T. KNOTT COMPANY, INC., New York, N. Y. Filed Sept. 4, 1937.

Rosalyn

For Handbags, Pocketbooks, Purses, Hatboxes for Use in Travel, Suit Cases, Overnight Bags, School Bags, Traveling Bags, Valises, Billfolds, Automobile Trunks, Wallets, Card Cases, Leather Key Cases, Trunks, Portfolios, Satchels, Luggage Straps, and Wardrobe Cases.
Claims use since 1925.

Ser. No. 397,714. LENTHERIC, INCORPORATED, New York, N. Y. Filed Sept. 23, 1937.

FORMALITÉ

For Women's Handbags Containing Perfume and Cosmetic Articles.
Claims use since Sept. 20, 1937.

CLASS 4

Abrasive, Detergent, and Polishing Materials

Ser. No. 393,200. ROMEO PARENT, doing business as Familex Products Company, Montreal, Quebec, Canada. Filed May 24, 1937.

FAMILEX

For Shaving Soaps.
Claims use since July 1, 1928.

Ser. No. 395,887. H. KIRK WHITE AND COMPANY, Oconomowoc, Wis. Filed July 31, 1937.

ADSAL

For Cleaning Compound—Namely, a Nonexplosive Solvent Which Removes Oil and Grease Spots from Any Type of Clothing and Leather Goods, and Type Cleaner.
Claims use since Apr. 30, 1937.

Ser. No. 397,052. RUSTAIN PRODUCTS INCORPORATED, New York, N. Y. Filed Sept. 2, 1937.

ZUD

For Rust and Stain Remover for Bath Tubs, Sinks, and the Like.
Claims use since Aug. 20, 1937.

Ser. No. 397,103. PERCY MCNEILL GARROD, doing business as Garrod Products, Port Richmond, Staten Island, N. Y. Filed Sept. 3, 1937.

"RAY-O-LITE"

For Cleansing Composition for Glasses, Dishes, and the Like.
Claims use since June, 1936.

Ser. No. 397,123. WM. T. KNOTT COMPANY, INC., New York, N. Y. Filed Sept. 4, 1937.

BEAU-KNOT

For Soaps, Soap Chips, Soap Powder, and Shaving Creams.
Claims use since October, 1931.

Ser. No. 397,419. PINAUD INCORPORATED, New York, N. Y. Filed Sept. 14, 1937.

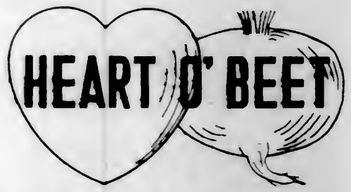
UP

For Liquid Shaving Lotion to be Applied to the Face Before Shaving With Electric Razors.
Claims use since Sept. 2, 1937.

CLASS 6

Chemicals, Medicines, and Pharmaceutical Preparations

Ser. No. 384,715. REEFER-GALLER INC., New York, N. Y. Filed Oct. 23, 1936.



For Insecticides, Insect Exterminators, Repellents, Deterrents, and Preventives.
Claims use since Feb. 4, 1936.

Ser. No. 389,049. LUIGI AIELLO, Scranton, Pa. Filed Feb. 18, 1937.

The portrait is that of the applicant.
For Medicinal Preparation for Treating Human Feet.
Claims use since Jan. 15, 1937.

Ser. No. 389,290. JOSEPH L. ZIMMERMAN, doing business as Heart O'Beet Laboratory, Chicago, Ill. Filed Feb. 23, 1937.

No claim is made to the word "Beet" apart from the mark.
For Medicinal Tonic for Use in Promoting Blood, Bone, and Tissue Building.
Claims use since April, 1934.

Ser. No. 390,392. FRANK A. WHETZEL, doing business as Sasa Products Co., Portland, Oreg. Filed Mar. 22, 1937.

The drawing is lined for yellow and black.
For Hair Tonic, Cold Cream, Camphor Cream, Shampoo, Face Lotion, Hair Pomade, Salve for Colds, Sulphur Salve for Soothing and Healing the Skin.
Claims use since June, 1933.

Ser. No. 391,359. TOC'S PRODUCTS COMPANY, INC., Syracuse, N. Y. Filed Apr. 14, 1937.

TOC'S

For Disinfectant, Deodorant, Bleach, and Germicidal Preparation Having Incidental Cleansing Properties, a Water Softener, Ammonia, and Insecticide.
Claims use since Jan. 1, 1934.

Ser. No. 391,763. HUSSMANN-HOLMES COMPANY, Los Angeles, Calif. Filed Apr. 23, 1937.

H&H

For Foot Powder.
Claims use since Mar. 30, 1937.

Ser. No. 392,669. COFFIN-REDINGTON COMPANY, San Francisco, Calif. Filed May 8, 1937.

CORECO

For Antacid Powder; Earache Drops; Nose and Throat Drops; Rectal Cones; Soda Perborate Flavored; Sulphur Ointment; Syrup Eucalyptus; Honey and Ammon. Muriate; Soda Mint Tablets; Soda Mint and Pepsin Tablets; Chlorate Potash Tablets; Toothache Relief Kit; Chilblain Relief; Beef, Iron, and Wine; Argentine Ant Powder; Analgesic Balm; Sun-Tan Lotion; Freckle Cream; Alco-Massage; Argentine Ant Poison; Argentine Ant Poison Home Set; Cold Sore Lotion; Aspirin; Bay Rum; Corn Medicine; Rectal Ointment; Poison Oak Lotion; Poison Oak Balm; Oxy-Borate; Nasal Ointment; Oil-O-

Pyn Germicide; Russian Mineral Oil; Nasal Jelly with Ephedrine; Psyllium Seed; Carbolic Salve; Tooth Ache Drops; Artificial Carlsbad Salt; Sulphur and Cream of Tartar Lozenges; Norwegian Cod Liver Oil; Throat and Chest Rub; Dental Mouth Wash; Milk of Magnesia; Citrate of Magnesia; Laxative Tablets; Blue Ointment; Larkspur Lotion; Hydrogen Peroxide (Refined 20 Volume); Hydrogen Peroxide; Laxative Head Cold Tablets; Infant Glycerin Suppositories; Adult Glycerin Suppositories; Foot Powder; Fly Spray; Eye Bath; Eucalyptus Ointment Compound; Hygienic Powder; Zinc Ointment; Compound White Pine, Wild Cherry, and Tar Cough Syrup; Chocolate Coated Cascara Sagrada Extract; Syrup of Figs Compound; Powdered Borax; Boric Acid Crystals; Hygienic Cones; Powdered Boric Acid; Astringent Gargle; White Liniment; Powdered Alum; Compound Licorice Powder; Pure Cocoa Butter; Chlorate of Potash; Chamomile Flowers; Cascara Bark; Buchu Leaves with Stems; Powdered Turmeric; Sodium Fluoride; Bicarbonate of Soda; Cut Soap Bark; Senna Leaves; Sassafras Bark; Powdered Salt Petre; American Saffron; Rochelle Salt; Precipitated Chalk; Potassium Permanganate; Oxalic Acid; Powdered Orris Root; Naphthalene Flakes; Moth Balls; Insect Powder; Egyptian Henna Leaves (Powdered); Henna Leaves with Stems; French Chalk; Flowers of Sulphur; Compound Cathartic Pills Improved; Flaxseed; Ground Flaxseed; Epsom Salt; Cream of Tartar; Acetone; Fluid Extract Cascara Sagrada; Solution Formaldehyde; Essence Peppermint; Mosquito and Flea Lotion; Sweet Oil; Castor Oil; Lime Water; Goose Grease; Fluid Extract Cascara Sagrada Bitter; Dobells Solution; Rose Water; Burnt Sugar Coloring; Eucalyptus Oil; Oil Wintergreen Synthetic; Compound Essence of Vanillin; Chloroform Liniment; Calamine Lotion; Brown Mixture without Opium; Oil Sweet Almonds; Saturated Solution Boric Acid; Washing Ammonia; Completely Denatured Alcohol; Solution Carbolic Acid; Powdered Willow Charcoal; Syrup of Squill Compound; Witch Hazel; Glycerin; Oil Citronella; Tincture Iron Chloride; Tincture Iodine; Tincture Green Soap; Tincture Arnica; Tincture Benzoin Compound; Tincture Benzoin; Syrup of Squill; Glycerin and Rose Water; Oil Cloves; Aromatic Spirits Ammonia; Sweet Spirits Nitre; Aromatic Castor Oil; Solution of Soda Silicate; Sheep Dip; Spirits Camphor; Syrup of Ipecac; Camphorated Oil; Cramp and Colic Compound; Syrup of Rhubarb; and Cascara Compound Tablets Hinkle.

Claims use since Jan. 30, 1935.

Ser. No. 393,589. FEDERAL YEAST CORPORATION, Baltimore, Md. Filed June 3, 1937.

Smooth - Tex

For Powder known in the trade as "Baking Cream" Consisting of Sodium Pyrophosphate and Corn Starch in Predetermined Amounts Which Reacts with Separately Added Bicarbonate of Soda to Produce Leavening Action in the Baking Operation.

Claims use since Apr. 14, 1937.

Ser. No. 394,804. PROFESSIONAL LABORATORIES, INC., New York, N. Y. Filed July 2, 1937.

ALL-VI-RON

For Preparations Composed of Various Vitamins and Iron for Supplementing Diets Deficient in Vitamins and Iron.

Claims use since June 26, 1937.

Ser. No. 394,882. CHARLES J. CINSOLO, Deer Park, Ohio. Filed July 3, 1937.

SO EZE Washing Fluid

The words "Washing Fluid" are disclaimed apart from the mark. The representations of the two children are fanciful.

For Chemical Washing Fluids for Washing, Bleaching, Deodorizing, and Disinfecting.

Claims use since May 24, 1937.

Ser. No. 395,224. CUROX LABORATORIES, INC., Longview, Tex. Filed July 15, 1937.

CUROX

For Antiseptic Healing Powder, a Foot Powder, and a Feminine Hygiene Powder.

Claims use since Feb. 1, 1937.

Ser. No. 395,235. MOORMAN MANUFACTURING COMPANY, Quincy, Ill. Filed July 15, 1937.

MOORMACIDE

For Mange Treatment Preparation and Sterilizing Oil for Animals and Fowl.

Claims use since July, 1932.

Ser. No. 395,350. S. SCHWABACHER & CO., INC., New York, N. Y. Filed July 17, 1937.

FLAG BRAND

WHITE OILS

The words "White Oils" and "Brand" are disclaimed apart from the mark.

For Russian Mineral Oil for Use in the Manufacture of Pharmaceuticals, Cosmetics, and for General Use in the Industrial Arts.

Claims use since Jan. 3, 1930.

Ser. No. 395,401. CRUSELLAS RHUM QUINQUINA CO., INC., New York, N. Y. Filed July 19, 1937.

A LA FLORA CUBANA

RHUM QUINQUINA

The words "Cubana" and "Rhum Quinquina" are disclaimed apart from the mark.

For Hair Tonic.

Claims use since Sept. 1, 1915.

Ser. No. 395,854. CELLULOSE HOLDINGS, LTD., New York, N. Y. Filed July 31, 1937.

FLAXYL

For Chemical Compounds for Finishing Textiles and Papers by Impregnating and Coating.

Claims use since Apr. 10, 1937.

Ser. No. 396,234. CHRISTIAN Z. MARTIN, doing business as Marco Products Company, Mountville, Pa. Filed Aug. 10, 1937.

VICTOR VAPOR RUB

The words "Vapor Rub" are disclaimed apart from the mark.

For Salve or Ointment for Use in Treatment of Coughs, Colds, Nasal Irritation, Throat Irritation and the Like, and Skin Troubles.

Claims use since Oct. 12, 1936.

Ser. No. 396,257. EMILE MCK. BEEKMAN, doing business as Beekman Chemical Company, New York, N. Y. Filed Aug. 11, 1937.

STREPTOGON

For Para-Aminobenzene-Sulphonamide for Treating Infections.

Claims use since May 1, 1937.

Ser. No. 396,677. FYNNON LIMITED, Brentford, England. Filed Aug. 23, 1937.

FYNNON

For Medicinal Salts for Treating Rheumatism and Kindred Complaints.

Claims use since 1905.

Ser. No. 396,727. ABERDEEN LABORATORIES INC., New York, N. Y. Filed Aug. 25, 1937.

ABERITE

For Boiler Compounds, Compounds for the Prevention of Corrosion and Scale Formation, Water Treatment Compounds for the Prevention of Corrosion and Scale Formation, Compounds for the Prevention of Foaming and Carry Over in Boilers and Compounds for the Prevention of Corrosion and Scale Formation in Air Conditioning Equipment, Steam Return Line Systems, Water Lines and Street Heating Systems.

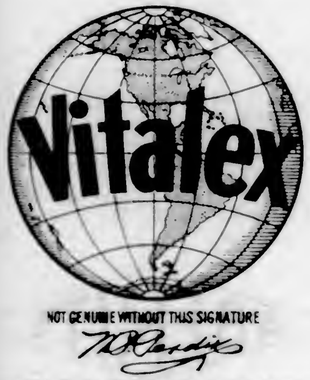
Claims use since Aug. 10, 1937.

Ser. No. 396,761. MERRITT F. BUTLER, doing business as Freeman Products, Howard City, Mich. Filed Aug. 26, 1937.

PYLETTS

For Medicinal Preparation for Treating Piles.

Claims use since June 1, 1935.



Ser. No. 396,780. GEORGE WILBER NULF, doing business as Wilber-Allen Laboratory, Fort Wayne, Ind. Filed Aug. 26, 1937.

TRI-FO-LEPTIC

For Medical Compound Recommended for Treatment of Epilepsy.

Claims use since July 19, 1937.

Ser. No. 396,781. MANUAL P. PERDIZ, doing business as Vitalex Laboratories, Buffalo, N. Y. Filed Aug. 26, 1937.

The name "M. P. Perdiz" is a facsimile signature of applicant. The words "Not Genuine Without This Signature" are disclaimed.

For Reconstructive Tonic Containing Vitamins A-B-D-G.
Claims use since June, 1936.

Ser. No. 397,451. ALBERT MINKS, Elmwood Place, Ohio. Filed Sept. 15, 1937.

KUMFO

For Antiseptic for the Relief of Athlete's Foot, Rubber Itch, Ring Worm, Poison Ivy, and Sore Mouth.
Claims use since Aug. 25, 1937.

Ser. No. 397,465. BENN WINDT, New York, N. Y. Filed Sept. 15, 1937.

LOLLI-PALS

For Cough Bon Bons, Cough Confections, and Cough Syrups.
Claims use since Aug. 1, 1936.

Ser. No. 397,548. PHAGE LABORATORIES, INC., New York, N. Y. Filed Sept. 18, 1937.

PHAGE

For Medicament Useful in the Treatment of Hay Fever and Other Air-Borne Infections.
Claims use since April, 1936.

Ser. No. 397,549. PUREX CORPORATION, LTD., South Gate, Calif. Filed Sept. 18, 1937.

INTRAFIL

For Bleach and Water Softener Having Incidental Germicidal, Deodorant, and Disinfectant Properties.
Claims use since Sept. 7, 1937.

Ser. No. 397,554. JACQUES ROSMAN, doing business as L'Ardy Cosmetic Laboratories, New York, N. Y. Filed Sept. 18, 1937.

L'Ardy
NEW YORK

Applicant disclaims the words "New York" except as shown.

For Cold Creams, Vanishing Creams, Non-Drying Masque, Liquid Nourishing Cream, Hand Cream, Hand Lotions, Nourishing Cream, Liquefying Cleansing Cream, Permanent Wave Lotions, Face Creams, Hair and Skin Lotions, Astringents, Face Powders, Compact Powders, Talcum Powders, Toilet Powders, Perfume Extracts, Toilet Waters, Pomades (in Pots, Sticks, and Cakes), Hair Wax, Hair Tonics, Hair Dyes, Hair Oils, Head Washes, Eyebrow Pencils, Rouges, Bath Salts, Nail Polishes, Nail Polish Removers, and Shampoos.
Claims use since June 14, 1937.

Ser. No. 397,560. VAPO-EFRIN COMPANY, INC., Portland, Oreg. Filed Sept. 18, 1937.

VIO-RAY

For Medicinal Preparation Containing Ephedrine Useful for the Treatment of Colds, Hay Fever, Catarrh, Sinusitis, and for Shrinking the Mucous Membrane.
Claims use since Aug. 1, 1933.

Ser. No. 397,570. THE CALCO CHEMICAL COMPANY, INC., Bound Brook, N. J. Filed Sept. 20, 1937.

GLUTAN
H-C-L

The drawing is lined for red.
For Pharmaceutical Preparation for Use in the Treatment of Pernicious Anemia.
Claims use since Aug. 5, 1937.

Ser. No. 397,573. FILTROL COMPANY OF CALIFORNIA, Los Angeles, Calif. Filed Sept. 20, 1937.

MIRACID

For Adsorptive and Purifying Material for Treatment of Dry Cleaners' Solvents.
Claims use since June 26, 1937.

Ser. No. 397,598. LEHN & FINK PRODUCTS CORPORATION, Bloomfield, N. J. Filed Sept. 20, 1937.

TRIPLE SHEER

For Face Powder.
Claims use since July 8, 1937.

Ser. No. 397,633. HAROLD A. E. WENGER, doing business as Regnew Laboratories, Madison, Wis. Filed Sept. 21, 1937.

MUSKEETUM
MAKES EM SCRAM

The words "Makes-Em-Scram" are disclaimed apart from the mark.
For Insect Repellent Material.
Claims use since Mar. 12, 1936.

Ser. No. 397,807. FRANK W. HORNER INC., Lynn, Mass. Filed Sept. 25, 1937.

FERMENTOL

For Aromatic Combination of Digestive Ferments.
Claims use since Jan. 27, 1924.

Ser. No. 397,865. POLTOID CO., New York, N. Y. Filed Sept. 27, 1937.

POLTOIDS

For Dental Poultices.
Claims use since Sept. 16, 1937.

Ser. No. 398,058. PRINCE MATCHABELLI, INC., New York, N. Y. Filed Oct. 2, 1937.

Jingle Bell

For Perfume and Toilet Water.
Claims use since Aug. 16, 1937.

Ser. No. 398,067. THE TITANIUM ALLOY MANUFACTURING COMPANY, Niagara Falls, N. Y. Filed Oct. 2, 1937.

Rufium

For Chemical Compounds Used as Welding Fluxes.
Claims use since June 18, 1937.

Ser. No. 398,238. CLARK-MILLNER COMPANY, Chicago, Ill. Filed Oct. 7, 1937.

Three Sisters

For Cosmetics and Beauty Preparations—Namely, Cleansing Pads, Skin Tonic, and Liquid Skin Powder.
Claims use since June 17, 1937.

CLASS 7

Cordage

Ser. No. 393,987. VICTOR JOHNSON & COMPANY, INC., San Francisco, Calif. Filed June 12, 1937.

The mark consists of red and purple twisted strands of Yarn in the center of one of the strands of the rope. The representation of the goods is disclaimed apart from the mark.
For Manila Rope.
Claims use since May 10, 1937.

Ser. No. 397,176. BROWN-CAMP HARDWARE COMPANY, Des Moines, Iowa. Filed Sept. 7, 1937.

I.O.A.

For Rope and Cotton Wrapping Twine.
Claims use since 1907.

CLASS 11

Inks and Inking Materials

Ser. No. 396,249. DITTO, INCORPORATED, Chicago, Ill. Filed Aug. 10, 1937.

Spot Color

The word "Color" is disclaimed apart from the mark. The outline in the drawing is the representation of a spot which in actual use is colored.

119,668. COTTON PIECE GOODS. Registered December 11, 1917. CONVERSE & COMPANY. Renewed December 11, 1937, to Fruit of the Loom Mills, Inc., New York, N. Y., a corporation of New York, by change of name.

119,669. COTTON PIECE GOODS. Registered December 11, 1917. CONVERSE & COMPANY. Renewed December 11, 1937, to Fruit of the Loom Mills, Inc., New York, N. Y., a corporation of New York, by change of name.

119,670. COTTON PIECE GOODS. Registered December 11, 1917. CONVERSE & COMPANY. Renewed December 11, 1937, to Fruit of the Loom Mills, Inc., New York, N. Y., a corporation of New York, by change of name.

119,739. HEMOSTATICS FOR LOCAL APPLICATION. Registered December 11, 1917. THE ELI LILLY AND COMPANY. Renewed December 11, 1937, to Eli Lilly and Company, Indianapolis, Ind., a corporation of Indiana, by change of name.

120,073. COTTON PIECE GOODS. Registered January 8, 1918. CONVERSE & COMPANY. Renewed January 8, 1938, to Fruit of the Loom Mills, Inc., New York, N. Y., a corporation of New York, by change of name.

120,457. VARNISHES. Registered February 5, 1918. WADSWORTH, HOWLAND & CO., INCORPORATED, Boston, Mass. Renewed February 5, 1938, to Wadsworth, Howland & Company, Inc., Malden, Mass., a corporation of Massachusetts.

120,508. RUBBER VEHICLE-TIRES. Registered February 12, 1918. THE MARATHON TIRE & RUBBER CO., Cuyahoga Falls, Ohio. Renewed February 12, 1938, to Marathon Rubber Company, Inc., Akron, Ohio, a corporation of Ohio, assignee.

120,647. PREPARATIONS FOR USE IN REMOVING CUTICLE AROUND FINGER AND TOE NAILS. Registered February 19, 1918. UNITED DRUG COMPANY, Boston, Mass. Renewed February 19, 1938, to Allcock Manufacturing Co., Ossining, N. Y., a corporation of New York, assignee.

120,845. CEDAR CHESTS. Registered March 12, 1918. J. R. CLARK COMPANY, Minneapolis, Minn., a corporation of Minnesota. Renewed March 12, 1938.

120,884. CERTAIN NAMED TOILET PREPARATIONS. Registered March 12, 1918. MCCLINTONS LIMITED, Donaghmore, Ireland, a corporation of the Kingdom of Great Britain and Ireland (now of Northern Ireland). Renewed March 12, 1938.

120,886. CERTAIN NAMED FOODS. Registered March 12, 1918. MANTECA CANNING CO., Stockton and Manteca, Calif. Renewed March 12, 1938, to Manteca Canning Co., Manteca, Calif., a corporation of California.

120,887. CERTAIN NAMED FOODS. Registered March 12, 1918. MANTECA CANNING CO., Stockton and Manteca, Calif. Renewed March 12, 1938, to Manteca Canning Company, Manteca, Calif., a corporation of California.

120,921. THERAPEUTIC AGENTS CONSISTING OF SALICYLATES FOR INTERNAL USE. Registered March 12, 1918. HENRY SOLOMON WELLCOME, London, England. Renewed March 12, 1938, to Burroughs Wellcome & Co. (U. S. A.) Inc., New York, N. Y., a corporation of New York, assignee by mesne assignments.

120,945. CERTAIN NAMED CUTLERY, MACHINERY, AND TOOLS AND PARTS THEREOF. Registered March 19, 1918. BUCYRUS COMPANY. Renewed March 19, 1938, to Bucyrus-Erie Company, South Milwaukee, Wis., a corporation of Delaware, assignee.

120,993. CERTAIN NAMED KNITTED AND WOVEN UNDERWEAR. Registered March 19, 1918. THE NORTHWESTERN KNITTING CO. Renewed March 19, 1938, to Munsingwear, Inc., Minneapolis, Minn., a corporation of Delaware, assignee.

121,047. METALLIC PACKING. Registered April 2, 1918. CRANE PACKING COMPANY, Chicago, Ill., a corporation of Illinois. Renewed April 2, 1938.

121,172. CERTAIN NAMED ARTICLES MADE WHOLLY OR PARTLY OF OR PLATED WITH PRECIOUS METAL. Registered April 16, 1918. DINHOFER BROS. Renewed April 16, 1938, to Dinhofer Bros. Inc., New York, N. Y., a corporation of New York, successor.

121,215. BELTING AND BELT-LACINGS COMPOSED WHOLLY OR PARTIALLY OF LEATHER, FABRIC, OR RUBBER. Registered April 16, 1918. SHULTZ BELTING COMPANY, St. Louis, Mo. Renewed April 16, 1938, to Graton & Knight Company, Worcester, Mass., a corporation of Massachusetts, assignee.

121,216. BELTING AND BELT-LACINGS COMPOSED WHOLLY OR PARTIALLY OF LEATHER, FABRIC, OR RUBBER. Registered April 16, 1918. SHULTZ BELTING COMPANY, St. Louis, Mo. Renewed April 16, 1938, to Graton & Knight Company, Worcester, Mass., a corporation of Massachusetts, assignee.

121,229. CERTAIN NAMED FOODS. Registered April 16, 1918. G. H. WETTERAU AND SONS GROCER CO., St. Louis, Mo., a corporation of Missouri. Renewed April 16, 1938.

121,293. FOOD COMPOUNDED OF ALFALFA, GRAIN, AND MOLASSES, FOR HORSES AND OTHER LIVE STOCK. Registered April 23, 1918. DWIGHT E. HAMLIN. Renewed April 23, 1938, to Dwight Hamlin Company, Pittsburgh, Pa., a corporation of Delaware, assignee.

121,305. CERTAIN NAMED CAST-METAL PLUMBING WARE WITH VITREOUS-ENAMEL COATING. Registered April 23, 1918. KOHLER COMPANY, Kohler, Wis., a corporation of Wisconsin. Renewed April 23, 1938.

121,318. RED LEAD. Registered April 23, 1918. NATIONAL LEAD COMPANY, New York, N. Y., a corporation of New Jersey. Renewed April 23, 1938.

121,319. LINSEED-OIL. Registered April 23, 1918. NATIONAL LEAD COMPANY, New York, N. Y., a corporation of New Jersey. Renewed April 23, 1938.

121,338. QUENCHING-OIL USED IN THE TREATMENT OF IRON, STEEL, AND OTHER METALS. Registered April 23, 1918. WILLIAM C. ROBINSON & SON COMPANY, Baltimore, Md., a corporation of Maryland. Renewed April 23, 1938.

LABELS

REGISTERED NOVEMBER 23, 1937

50,378.—*Title:* A-PENN WINDOW AND GLASS CLEANER. For a Liquid Window and Glass Cleaner. A-PENN OIL COMPANY, Butler, Pa. Published October 1, 1937.

50,379.—*Title:* MAGIC-POP SOUTH AMERICAN POP CORN. For Pop Corn. AMERICAN POP CORN COMPANY, doing business as National Pop Corn Company, Sioux City, Iowa, and Lima, Ohio. Published September 25, 1937.

50,380.—*Title:* THREE SISTERS 5 PURPOSE SKIN TONIC. For Skin Tonic. CLARK-MILLNER COMPANY, Chicago, Ill. Published July 30, 1937.

50,381.—*Title:* 3–C. For Charcoal. CONSOLIDATED CHARCOAL CO., INC., Brooklyn, N. Y. Published October 4, 1937.

50,382.—*Title:* CRISPY. For Potato Chips. CRISPY FOOD COMPANY, Cedar Rapids, Iowa. Published September 30, 1937.

50,383.—*Title:* LUCERNE. For Chocolates. DAGGETT CHOCOLATE COMPANY, doing business as Marquise Chocolate Company, Cambridge, Mass. Published August 22, 1936.

50,384.—*Title:* VOGUE HAIR FOUNDATION ROLL. For Hair Foundation Rolls. G. H. S. CORPORATION, New York, N. Y. Published April 15, 1937.

50,385.—*Title:* NYS. For a Drink. GEORGE ALFRED HOUSEMAN, Shreveport, La. Published June 15, 1937.

50,386.—*Title:* JOHNSON'S HAY FEVER RELIEF. For an Eye Wash for Hay Fever Relief. JOHNSON'S LABORATORIES, New Orleans, La. Published September 27, 1937.

50,387.—*Title:* JOHNSON'S HAY FEVER RELIEF. For an Ointment for Hay Fever Relief. JOHNSON'S LABORATORIES, New Orleans, La. Published September 27, 1937.

50,388.—*Title:* O G THE PERFECT BEER. For Beer. NEW PHILADELPHIA BREWERY, INC., New Philadelphia, Ohio. Published April 1, 1937.

50,389.—*Title:* PADRE. For Burgundy Wine. PADRE VINEYARD COMPANY, Los Angeles, Calif. Published September 21, 1937.

50,390.—*Title:* PADRE. For Grape Brandy. PADRE VINEYARD COMPANY, Los Angeles, Calif. Published September 21, 1937.

50,391.—*Title:* PADRE. For Muscatel Wine. PADRE VINEYARD COMPANY, Los Angeles, Calif. Published September 21, 1937.

50,392.—*Title:* PADRE. For Port Wine. PADRE VINEYARD COMPANY, Los Angeles, Calif. Published September 21, 1937.

50,393.—*Title:* PADRE. For Sauterne Wine. PADRE VINEYARD COMPANY, Los Angeles, Calif. Published September 21, 1937.

50,394.—*Title:* PADRE. For Sherry Wine. PADRE VINEYARD COMPANY, Los Angeles, Calif. Published September 21, 1937.

50,395.—*Title:* RED RIBBON. For Canned Tomatoes. J. & M. STEINER, INC., Milwaukee, Wis. Published October 1, 1937.

50,396.—*Title:* THE LITTLE VILLAGE DRESS SHOP. For Dresses for Dolls. TRANSOGRAM COMPANY, INC., Easton Pa., and New York, N. Y. Published August 4, 1937.

50,397.—*Title:* PENNANT SERIES. For Pencil Tablets. WHITE & WYCKOFF MFG. CO., Holyoke, Mass. Published October 15, 1937.

50,398.—*Title:* COCILANA COUGH-NIPS. For Cough Candy. WINDT CHEMISTS, INC., New York, N. Y. Published June 10, 1937.

PRINTS

REGISTERED NOVEMBER 23, 1937

16,587.—*Title:* MACE 'AUTO-B-MY' SERVICE. For Automotive Equipment. TERRE HAUTE TIRE CO., INC., Terre Haute, Ind. Published April 13, 1937.

PLANT PATENTS

GRANTED NOVEMBER 23, 1937

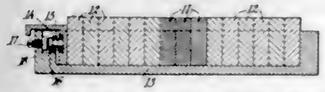
Owing to the fact that almost all of the illustrations of the plant patents are in colors, it is not practicable to print a cut of the drawing.

264
ROSE
Jean H. Nicolas, Newark, N. Y., assignor to Jackson & Perkins Company, Newark, N. Y.
Application March 24, 1937, Serial No. 132,865
1 Claim. (Cl. 47—61)

A new and distinct variety of rose plant characterized as to novelty by its strong constitution, hardiness in a larger territory than the normal Hybrid Tea, dark holly foliage on long stems, continuity and profuseness of bloom, and the nasturtium color of the blooms with opalescent variations, substantially as shown and described.

PATENTS

GRANTED NOVEMBER 23, 1937



2,099,670

STOOL TO BE USED IN THE CASTING OF METAL

Charles H. Aldrich, Elizabeth, N. J., assignor to The American Metal Company, Limited, New York, N. Y., a corporation of New York

Application October 22, 1935, Serial No. 46,096

8 Claims. (Cl. 22—139)

2. A composite stool for an open bottomed ingot mold having an area of direct impingement formed from a plurality of relatively narrow bars of cast iron which is adapted to resist the corrosive action of a stream of poured molten metal, and an area of non-impingement adjoining the area of direct impingement, the area of non-impingement comprising a plurality of relatively narrow copper bars disposed in side by side relation and adapted to distribute the heat of the cast ingot rapidly and evenly throughout the entire stool.

2,099,671

ANTENNA SYSTEM

George B. Bairey, Wolf Point, Mont., assignor, by mesne assignments, to Collins Radio Company, a corporation of Iowa

Application September 20, 1935, Serial No. 41,474

18 Claims. (Cl. 250—33)

1. An antenna system comprising a direct radiator consisting of a plurality of aligned pipe members connected one to the other and maintained in a vertically erect position, light directing means carried by the aligned pipe members, and a source of light disposed beneath said aligned pipe members for projecting light rays upon said light directing means and effecting substantially uniform distribution of spectral rays about said direct radiator.

2,099,672

ANTHRAQUINONYL THIAZOLES

Earl Edson Beard, Milwaukee, Wis., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application June 7, 1934, Serial No. 729,441

8 Claims. (Cl. 260—44)

1. The process of making thiazoles which comprises condensing a 1-nitro-anthraquinone-6-carbonyl halide with a carbon compound containing a benzene nucleus having amino and mercapto groups in adjacent positions thereon.

2,099,673

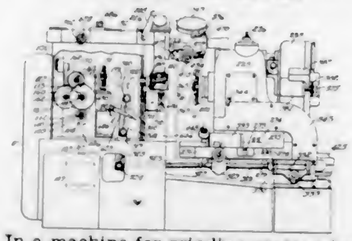
1-ACYL-AMINO-ANTHRAQUINONE-6-THIAZOLES

Earl Edson Beard, Milwaukee, Wis., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application March 20, 1935, Serial No. 11,964

7 Claims. (Cl. 260—44)

1. The process which comprises condensing 1-nitro-anthraquinone-6-carbonyl halide with a carbon compound containing amino- and mercapto-substituents on adjacent carbon atoms to produce a thiazole, converting the resultant to the corresponding 1-amino-anthraquinone-6-thiazole compound by treatment with an agent capable of reducing a nitro substituent to an amino substituent and condensing the last mentioned compound with a carbonyl halide.



2,099,674

MACHINE FOR GRINDING GEARS

Edward W. Bullock, Clarence T. Galloway, Leonard O. Carlsen, and Robert S. Condon, Rochester, N. Y., assignors to Gleason Works, Rochester, N. Y., a corporation of New York

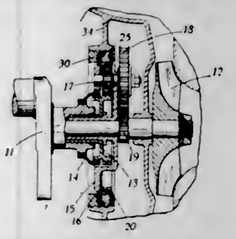
Application November 6, 1934, Serial No. 751,738

35 Claims. (Cl. 51—52)

1. In a machine for grinding gears, a tool support, a grinding-wheel journaled therein, a work support, separate cams for producing relative feed movements between the wheel and work support during rough-grinding and during finish-grinding, respectively, and means for bringing said cams selectively into operative position.

2,099,675

GEARING FOR DRIVING SUPERCHARGERS ON AIRCRAFT ENGINES



Gerard Mervyn Cutler, Coventry, England, assignor to Armstrong Siddeley Motors Limited, Coventry, England

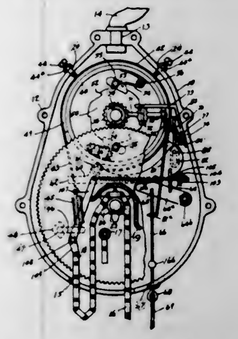
Application November 2, 1936, Serial No. 108,868

In Great Britain October 16, 1936

5 Claims. (Cl. 74—273)

1. A two-speed gearing, in the drive to the supercharger of an aircraft internal-combustion engine, comprising a driving sun gear, a driven sun gear, a planet-carrier, a compound two-pinion planet, the smaller of the pinions of said compound planet being in mesh with said driving gear, the larger of the pinions of said compound planet being in mesh with said driven gear, an internally-toothed reaction gear in mesh with the smaller of said pinions, controllable braking means for holding said planet-carrier stationary,

and controllable braking means for holding said reaction gear stationary, each of said braking means having a member with a screw-threaded connection with a stationary part to exert the braking action on rotation of the member.



2,099,676

FREE-CHAIN HOIST

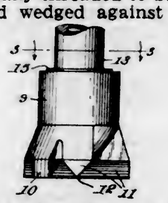
Fredrick W. Coffing, Danville, Ill.

Application November 30, 1934, Serial No. 755,259

15 Claims. (Cl. 254—171)

1. In a hoist having an enclosing housing, a single clutch and brake control member, the combination of a stop rigid with said member, said enclosing housing having an aperture therein to permit longitudinal movement of the member and an enlargement to permit passage of the stop into and out of housing, said stop upon engaging the interior wall of the housing limiting manually operable movement of the member toward clutch control position and to brake release and upon further movement of the stop through the enlargement securing clutch release, the exterior wall of said housing adjacent the enlargement and surrounding the aperture maintaining through stop engagement, said member in clutch and brake released position.

2,099,677



ROCK OR EARTH DRILL BIT

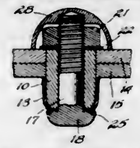
John P. Cunningham, Kingman, Ariz.

Application March 19, 1936, Serial No. 69,661

1 Claim. (Cl. 255—64)

A drill comprising a body having a tapered socket to receive a screw threaded end of a drill bar and a tapered split bushing located in said socket and internally threaded to be threaded on the drill bar and wedged against the tapering

walls of the socket when the drill bar comes to rest on the bottom wall of said socket.



2,099,678

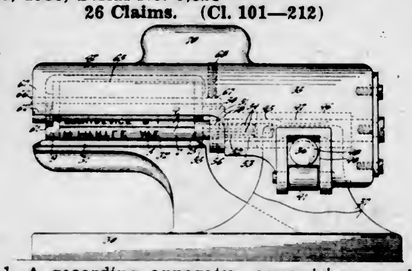
RIVET

Eugene W. Curtis, Chicago, Ill.

Application June 29, 1936, Serial No. 87,822

10 Claims. (Cl. 138—98)

1. A composite rivet assembly for use in patching the walls of boilers and like structures, comprising a hard metal sleeve adapted to pass through a rivet hole in the wall and project beyond the inner face of the wall, said sleeve being tapered at its inner end, a longitudinally movable element or bolt extending through the sleeve and having a head beyond the tapered inner end of said sleeve, and an expansible metal collar of slightly greater length than the projecting portion of the sleeve, interposed between the head of the longitudinally movable element and tapered end of the sleeve to form a seal between said head and the wall to which the rivet is applied when the expansible element is compressed over the projecting portion of the sleeve by longitudinal movement of the bolt in securing the rivet in place.



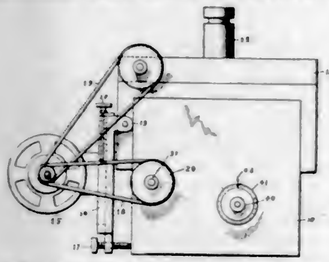
2,099,679

IDENTIFICATION AND RECORDING DEVICES

Elmer W. Davis, Newton Center, Mass., and Arthur H. Maynard, Warwick, R. I., assignors to Boston Wire Stitcher Company, Portland, Maine, a corporation of Maine

Original application October 10, 1931, Serial No. 568,048. Divided and this application March 6, 1935, Serial No. 9,628

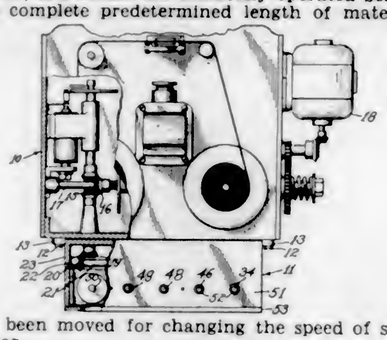
26 Claims. (Cl. 101—212)



1. A recording apparatus comprising a relatively small printing roller having indicia characters on its periphery, means for rotating the roller across the article to be printed, and interengaging means on the roller and rotating means self-acting to lock the parts together as one is moved axially into engagement with the other.

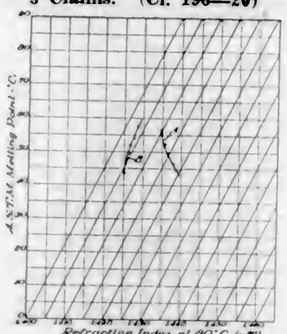
2,099,680
INSULATED RAIL JOINT
Clarkson A. Disbrow, New Rochelle, N. Y., assignor, by mesne assignments, to Poor & Company, a corporation of Delaware
Application September 10, 1935, Serial No. 39,975
7 Claims. (Cl. 238—155)

1. A rail joint comprising the rails, the splice bar, and a pair of superimposed sheets of insulation between the splice bar and the rails, one of said sheets extending at least from the middle of the joint to one end thereof and between the middle and said end of the joint being recessed, and the other sheet extending at least from the middle of the joint to said end thereof and across the recessed portion of the first mentioned sheet.



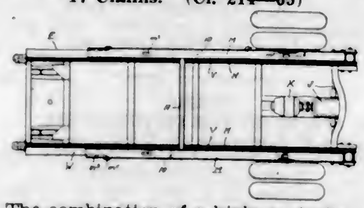
2,099,681
CAMERA INDEXING MECHANISM
Rupert H. Draeger, United States Navy
Application May 9, 1935, Serial No. 20,613
7 Claims. (Cl. 95—31)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. Film advancing means for a camera film, indexing mechanism comprising a film carrying wheel, a shaft on which said wheel is mounted and means for cyclically rotating said shaft a predeterminable amount, said means including a pair of clutch members, one of said clutch members being keyed to said shaft and the other of said clutch members being adapted to clutch said first clutch member in a film advancing direction only, and means for reciprocating said second mentioned clutch member, said reciprocating means including a pin projecting from said said second mentioned clutch member, a power rotary member, a slotted connecting member pivotally pinned to said power rotary member, the pin on said second mentioned clutch member extending through the slot of said slotted connecting member.



2,099,682
PAGE FINDER
Rupert H. Draeger, United States Navy
Application February 24, 1937, Serial No. 127,504
22 Claims. (Cl. 40—53)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. In a device for locating a desired portion of flexible material, a motor for moving said material, means for operating said motor at varying speeds, variably operable means for predetermining the length of material to be moved by said motor, and means automatically operated before the complete predetermined length of material



has been moved for changing the speed of said motor.

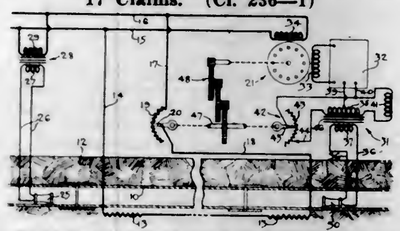
2,099,683
TREATMENT OF WAX MIXTURES
Seymour W. Ferris, Aldan, Willard F. Houghton, Swarthmore, and Henry C. Cowles, Jr., Philadelphia, Pa., assignors to The Atlantic Refining Company, Philadelphia, Pa., a corporation of Pennsylvania
Application August 21, 1935, Serial No. 37,168
3 Claims. (Cl. 196—20)

1. In a process for treating a hydrocarbon oil-wax mixture, the steps which comprise segregating from said mixture, a fraction containing the higher melting wax components thereof substantially free of oil and a fraction containing the lower melting wax components thereof substantially free of oil and subjecting at least one of said fractions to sweating.

2,099,684
MECHANISM FOR HANDLING FREIGHT CONTAINERS
Benjamin F. Fitch, Greenwich, Conn.
Application January 22, 1936, Serial No. 60,248
17 Claims. (Cl. 214—65)

1. The combination of a highway trailer, having a pair of parallel propelling chains mounted

on its chassis, motor mechanism and gearing for operating said chains, a pair of individual load supporting members carried by the trailer chassis on the outer sides of the chains respectively, and power actuated means for tilting said members to tilt a body resting thereon.

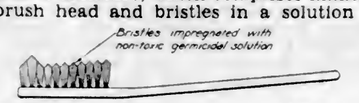


2,099,685
AROMATIC OXYKETONE ARSENICALS AND A PROCESS OF MAKING THEM
Cliff S. Hamilton, Lincoln, Nebr., assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan
No Drawing. Application April 11, 1932, Serial No. 604,658
11 Claims. (Cl. 260—14)

1. A compound comprising a benzene ring group joined to an arsenic group of the class including arsonic acids and their soluble salts, arseno compounds, arsenoxides, thio-arsenites and the water-soluble alkali metal salts thereof and joined in para position to a ketonic group through an ether linkage.

2,099,686
ORGANIC ARSENIC COMPOUNDS
Cliff S. Hamilton, Lincoln, Nebr., assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan
No Drawing. Application July 19, 1933, Serial No. 681,226
19 Claims. (Cl. 260—14)

1. Organic arsenic compounds in which the arsenic is attached to the aryl nucleus of an aryloxy alkanol group.



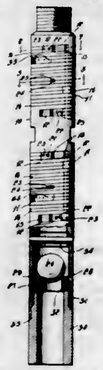
2,099,687
TEMPERATURE CONTROL APPARATUS
Henry E. Hartig, Robbinsdale, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application November 4, 1936, Serial No. 109,121
17 Claims. (Cl. 236—1)

1. In a temperature control system, temperature varying means, means for producing a sound impulse, and means operative to control said temperature varying means in accordance with the time required for said sound impulse to travel a predetermined distance over a path affected by the temperature of a controlling medium.

2,099,688
TOOTH BRUSH AND PROCESS OF MAKING THE SAME
Warren E. Hill, Northampton, and Clifford L. McArthur, Cambridge, Mass., assignors to Prophy-lac-tic Brush Company, Northampton, Mass., a corporation of Delaware
Application April 7, 1933, Serial No. 664,894
7 Claims. (Cl. 300—21)

1. The hereindescribed process of making an antiseptic brush having bristles which are impervious to moisture, which comprises immersing the brush head and bristles in a solution con-

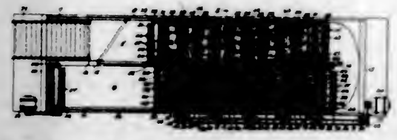
taining phenyl mercuric nitrate, paraffin wax and toluol.



2,099,689
WATER-INSOLUBLE METAL SALTS OF PHTHALOCYANINE-SULPHONIC ACIDS
Karl Holzach and Georg Niemann, Ludwigshafen-on-the-Rhine, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application April 18, 1936, Serial No. 75,234. In Germany April 20, 1935
7 Claims. (Cl. 260—11)

1. A water-insoluble metal salt of a phthalocyanine sulphonic acid.

2,099,690
WATER-INSOLUBLE SALTS OF PHTHALOCYANINE-SULPHONIC ACIDS
Karl Holzach and Georg Niemann, Ludwigshafen-on-the-Rhine, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Original application April 18, 1936, Serial No. 75,234. Divided and this application November 20, 1936, Serial No. 111,852. In Germany April 20, 1935
3 Claims. (Cl. 134—58.5)

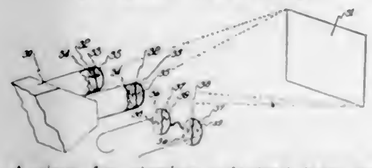


1. A color lake composition comprising a substratum and a water-insoluble metal salt of a phthalocyanine sulphonic acid.

2,099,691
SPIRAL PACKED WORKING BARREL VALVE BODY
William H. Hunter, Webb City, Mo.
Application September 3, 1936, Serial No. 99,297
8 Claims. (Cl. 103—225)

1. A valve body provided with a valve which retains fluid in said body to thereby create hydrostatic pressure, said body having a substantially spiral groove, a strip of packing disposed in said groove, said valve body having openings leading to said groove through which said pressure acts to expand said packing, and means midway of the terminals of the packing so that the packing will move substantially equally on opposite sides of such means.

2,099,692
WASHING APPARATUS
Theodore Krumm, Redlands, Calif., assignor to Paul A. Weilein, Los Angeles, Calif.
Application January 9, 1934, Serial No. 705,872
9 Claims. (Cl. 146—202)

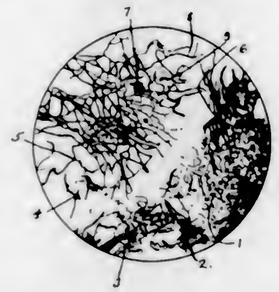


1. An apparatus for washing buoyant articles, comprising in combination, two communicating troughs arranged side by side for containing liquid, two sets of revoluble cleaning elements respectively supported transversely of each of said troughs and extending thereinto, means interconnecting the adjacent ends of said two sets of elements for effecting their rotation in opposite directions, common power means for rotating said elements, and spaced rows of movably anchored brushes arranged within said troughs transversely thereof, said brushes having curved article engaging surfaces which define scrubbing troughs between adjacent brushes whereby said articles are adapted to move through the liquid and successively enter said rows of troughs as they move under the revoluble cleaning elements.

2,099,693
GRIDIRON
Jacques Paul Louis Laffitte, Paris, France
Application January 25, 1936, Serial No. 60,855
In France January 25, 1935
4 Claims. (Cl. 53—5)

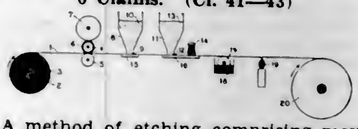
1. A grill for the preparation of grilled foods including a plate provided with channels for the collection of juices and greases and with openings for the heated grilling air or gases, said openings being arranged at approximately right angles to the plane of said plate and spaced from the upper surface of the plate, while being directed approximately parallel to the channels whereby the hot gases are prevented from coming into contact with the greases or the like that are expelled from the grilled substance when being grilled.

2,099,694
POLARIZING OPTICAL SYSTEM
Edwin H. Land, Wellesley Farms, Mass., assignor to Sheet Polarizer Company, Inc., Union City, N. J., a corporation of New Jersey
Application March 6, 1934, Serial No. 714,239
13 Claims. (Cl. 88—16.6)



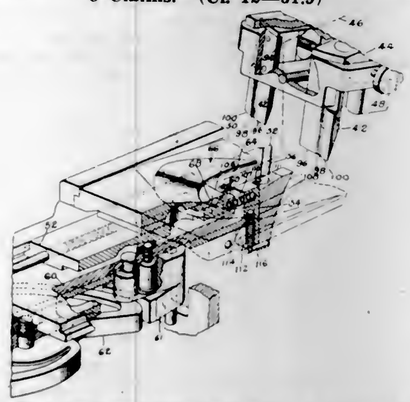
1. A visor for viewing polarized light having electric intensity components predeterminedly out of phase, comprising a sheet-like element adapted for polarizing light by absorption and means affixed thereto and cooperating therewith to render said visor substantially opaque to said light, and yet substantially transparent to polarized light having similar electric intensity components oppositely out of phase.

2,099,695
MEANS AND COMPOSITIONS FOR THE STABILIZATION OF DIVINYL ETHER
Randolph T. Major, Plainfield, and William L. Ruigh, Metuchen, N. J., assignors to Merck & Co., Inc., Rahway, N. J., a corporation of New Jersey
No Drawing. Original application June 21, 1933, Serial No. 676,926. Divided and this application April 3, 1935, Serial No. 14,438
8 Claims. (Cl. 23—250)



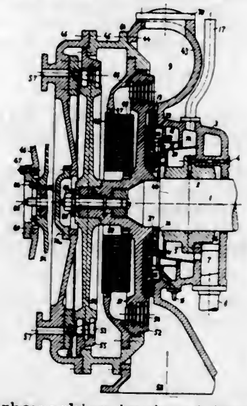
1. Divinyl ether stabilized with a poly-phenol of the group consisting of hydroquinone, pyrogallol, p-N-isopropylamino-phenol, p-aminophenol, and p-N-methylaminophenol.

2,099,696
TREATMENT OF PSORIASIS
Mary A. Marcus, New York, N. Y.
Application October 10, 1934, Serial No. 747,662
12 Claims. (Cl. 167—78)



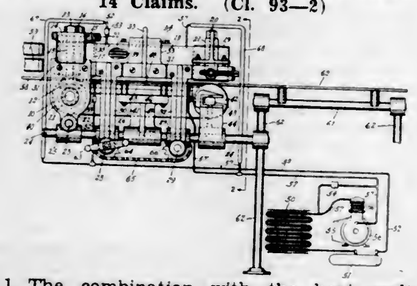
1. In preparing a polyvalent vaccine for the treatment of psoriasis the steps which consist in treating papules of said disease with a sterilizing medium, securing from said papules a filamentous micro-organism herein referred to as *Actinomyces psoriaticum*, said micro-organism being capable of reproducing in culture media having a pH of 6.4 at temperatures between 20 and 40° C. and forming round dark green colonies measuring from 3 to 5 microns in diameter, said colonies increasing in size and acquiring a white powdery surface when fructification occurs, said micro-organisms having ellipsoidal spores measuring from .5 to 1.3 microns in diameter, said micro-organisms also containing bodies having close sinistral spirals of 2–4 turns and corkscrew-shaped bodies having 2–4 loops and 1–3 knobs when 1% phosphate is added to the medium containing said micro-organism, propagating said micro-organism in a culture medium, preparing sub-cultures therefrom, separating the spore-free filamentous germinating form of the said micro-organism from the subculture medium, intermixing said spore-free filamentous germinating form of the said micro-organism with other strains of the same form of said micro-organism from other sources, suspending these mixed strains in a liquid vehicle, homogenizing the suspension, and sterilizing the said suspension.

2,099,697
METHOD OF AND MEANS FOR ETCHING METALS
Donald Aubrey Marshall, Toronto, Ontario, Canada, assignor, by mesne assignments, to Etched Products Inc., Detroit, Mich., a corporation of Michigan
Application March 13, 1935, Serial No. 10,925
6 Claims. (Cl. 41—43)



6. A method of etching comprising moving a continuous metal strip in a longitudinal direction, applying an ink design to one surface of the strip, applying asphaltum powder to the inked surface, applying talc powder to said surface, removing excess powder from said surface, applying an asphaltum varnish coating to the reverse surface of the strip, heating said strip to convert the asphaltum powder into an acid resist, all of said steps being performed during the movement of said strip, winding the strip into a helix with the inked surface exposed outermost, and subjecting said helix to an etching treatment.

2,099,698
HEEL-SEAT FITTING MACHINE
Ralph S. Megathlin, Wollaston, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application August 15, 1935, Serial No. 36,345
8 Claims. (Cl. 12—31.5)



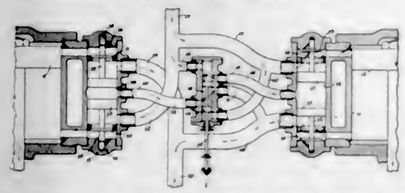
1. In a heel-seat fitting machine, a support for the sole of a shoe, and chisel-shaped blades movable in paths disposed at substantial angles to the general plane of the sole and constructed and arranged to form heel-breast receiving shoulders upon the sole, each of said blades comprising an elongated curved inner cutting edge extending transversely of the sole and shaped to form an inner shoulder portion which is substantially complemental to an opposing area of the breast of a heel to be attached to the shoe, each of said blades also comprising a short outer cutting edge which is reversely curved thicknesswise of the blade and extends rearwardly of the sole and toward the corresponding edge of the sole from the outer end of the inner cutting edge and is shaped to form an outer shoulder portion which is constructed and arranged to be forced forwardly by the heel so that the heel engages the inner portion of the shoulder.

2,099,699
TURBINE
Ulrich Meininghaus, Mulheim-Ruhr, Germany
Application March 16, 1933, Serial No. 661,119
In Germany March 30, 1932
16 Claims. (Cl. 253—79)

1. In a turbomachine impinged by a working medium, in combination, a main shaft, bearing bushes adapted to be inserted into and withdrawn from the machine by axial movement along said main shaft thereof, a housing sealed against the working medium and enclosing said bearing bushes, an adjacent casing sealed against the bearing oil, said casing being filled with the working medium during the operation of the machine, a flange arranged between said housing and said casing to be closed by a packing device and through which flange said bearing bushes are moved during insertion into or removal from the machine, and cooperating discs disposed within said casing and carrying blades or fins impinged by the working medium and normally blocking the movement of said bearing bushes through said flange, said discs being removable from the main shaft by axial movement to afford access to said bearing bushes and to enable said bearing bushes to be moved through said flange after the removal of said discs.

2,099,700
COOLING DEVICE FOR HOT SEALS
Elmer F. Mertis, Brooklyn, N. Y., assignor to American Machine & Foundry Company, a corporation of New Jersey
Application March 1, 1934, Serial No. 713,562
14 Claims. (Cl. 93—2)

1. The combination with the heat sealing mechanism of a package wrapping machine, of a refrigerated cooling chamber for chilling, heated seals of the packages, and thermostatically



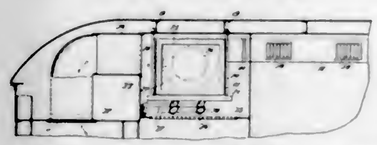
controlled means for circulating refrigerant through and maintaining said chamber at a substantially uniform temperature, said means including valves operating to stop the flow of refrigerant to said chamber whenever it falls below a predetermined temperature; said means including a device for stopping the further delivery of refrigerant to said chamber whenever it falls below a predetermined temperature.

2,099,701

STEAM ACTUATED POPPET VALVE GEAR FOR RECIPROCATING PUMPING ENGINES

Milton M. Metcalf, Vallejo, Calif.

Application July 23, 1936, Serial No. 92,134
13 Claims. (Cl. 121—157)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



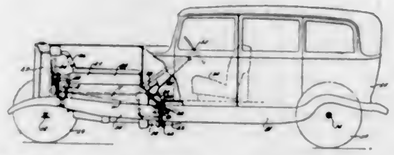
1. A steam actuated poppet valve gear for a steam engine and a pilot valve controlled by the steam engine; said poppet valve gear including a poppet valve gear steam chest, conduits joining the pilot valve gear steam chest to the poppet valve steam chest and to the steam engine, said poppet valve gear having two poppet valve cylinders therein, each cylinder having a steam poppet valve at one end and an exhaust poppet valve at the other end.

2,099,702

AIR CONDITIONING SYSTEM FOR CARS

Frank L. Murphy, Chicago, Ill., assignor to Pullman-Standard Car Manufacturing Company, Chicago, Ill., a corporation of Delaware

Application February 19, 1934, Serial No. 711,858
1 Claim. (Cl. 98—4)



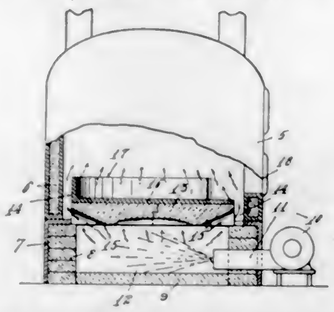
In a passenger car having an interior passenger space and a roof therefor, a false ceiling for the upper part of said space at each end portion of the car forming a pair of chambers, an air conditioning device in each of said chambers, both devices being capable of continuous, simultaneous operation, each device comprising a cooler and blower removably supported as a unit from the roof by securing means accessible from below the unit and each unit being of relatively small size, having a capacity less than the normal requirements of the car, the capacity of both units taken together being sufficient for said normal requirements, each false ceiling being apertured for admitting to the adjacent chamber air from the passenger space and being removable to permit insertion and removal of the unit in said chamber by manipulation of said securing means, a duct extending from each device toward the other having openings for discharging conditioned air into the passenger space, and ducts communicating with the chambers and with the exterior of the passenger space for supplying fresh air to said chambers.

2,099,703

MOTOR VEHICLE

Clyde R. Paton, Birmingham, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a corporation of Michigan

Application December 5, 1932, Serial No. 645,711
11 Claims. (Cl. 248—7)



1. In a motor vehicle, the combination of a supporting frame, an engine unit including a gear shift lever pivoted thereon, and yielding supporting means acting between the forward and rearward ends of said unit and the frame, said yielding supporting means being so constructed and arranged that the rocking action of the engine due to torque reaction will be about an axis substantially through the pivot of said lever.

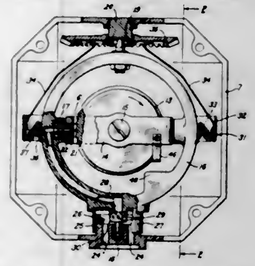
2,099,704

FURNACE

George Pirich, Minneapolis, Minn.

Application October 23, 1936, Serial No. 107,165
3 Claims. (Cl. 110—97)

1. In a furnace, a heat transfer chamber surrounded by heat transfer walls, a combustion chamber below the heat transfer chamber and having surrounding refractory walls, said combustion chamber being of less internal area than that of the heat transfer chamber and providing a marginal ledge adjacent the lower edge of the heat transfer walls, and a horizontally disposed plate-like refractory baffle member of slightly greater area than that of the combustion chamber and seated adjacent its outer edge upon said ledge to completely cover said combustion chamber, said baffle member being of materially less area than the space between the walls of the heat transfer chamber surrounding the margin of said baffle in spaced relation thereto, and said baffle having on its underside a marginal series of outwardly extending and upwardly flaring combustion channels leading from



the combustion chamber over said ledge and into the surrounding space thereabove defined by the outer edge of the baffle and walls of the heat transfer chamber.

2,099,705

DIRECTIONAL GYROSCOPIC INDICATOR

Wladimir A. Reichel, Philadelphia, Pa., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware

Application May 5, 1934, Serial No. 724,183
4 Claims. (Cl. 33—204)

1. In a gyroscopic indicator, a neutrally-mounted azimuth direction-keeping gyroscope, an annular indicating card mounted on and controlled by said gyroscope, and means for adjusting said card independently of said gyroscope to set a predetermined course.

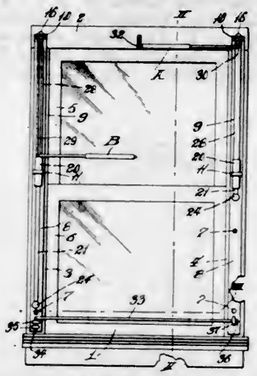
2,099,706

CONTROL DEVICE

William H. Richards, Dayton, Ohio

Application November 9, 1935, Serial No. 49,051
6 Claims. (Cl. 121—38)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. In a control system comprising, a member to be oscillated, a bi-chambered servo motor having a portion of its housing formed for rotatable connection to said member for fluid actuation thereof, an idling member journaled to said rotatable housing, and a control wheel directly connected to said idling member for manual actuation thereof, means selectively fixing the idling member to the servo housing and further means operatively connected to said first mentioned means to permit free fluid flow between the bi-chambers of said servo motor during manual actuation of said oscillated member.



2,099,707

ADJUSTABLE WINDOW CURTAIN FIXTURE

Albert C. Seibel, East St. Louis, Ill.

Application May 24, 1935, Serial No. 23,233
11 Claims. (Cl. 156—22)

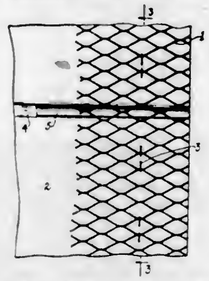
1. A curtain fixture comprising a vertically sustained support having a longitudinally slotted sleeve turnably mounted thereon, and a vertically adjustable curtain rail having a part which passes along within the slot of said sleeve in raising or lowering the rail.

2,099,708

THERAPEUTIC PRODUCT AND METHOD OF MAKING SAME

Elwood A. Sharp, Detroit, Mich., assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan

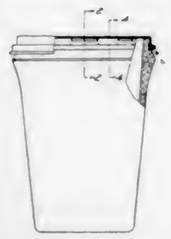
No Drawing. Application March 29, 1933, Serial No. 663,426
10 Claims. (Cl. 167—74)



1. A product derived from animal tissue of the class consisting of the stomach and duodenum, which product is effective in combating anemia, contains a thermolabile, water-soluble, active principle, has not less than approximately four times the anti-anemia potency of desiccated defatted hog stomach, is free from large amounts of said animal tissue and when in solid form is soluble in water and has a weight less than 5% of the original animal tissue from which it is derived.

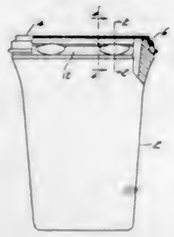
2,099,709

PLASTER BASE



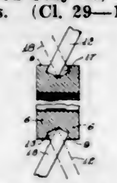
Arthur V. Spinosa, Parkersburg, W. Va., assignor to Penn Metal Company, Inc., a corporation of Delaware

Application May 5, 1934, Serial No. 724,008
7 Claims. (Cl. 72—116)



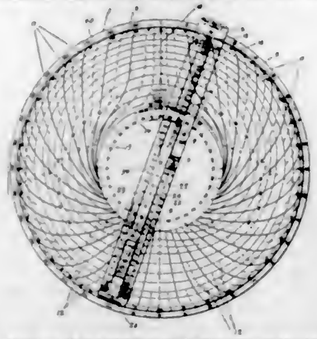
4. A plaster base comprising a sheet of metal lath, a stiff but springy paper backing having a groove therein, a reinforcing rib adapted to be received in said groove, means on the rib engaging and holding the backing, and other means for securing the backing to the lath.

2,099,710
HERMETICALLY SEALED PACKAGE
Harry E. Townsend, Brooklyn, N. Y.; Title Guarantee and Trust Company executor of estate of said Harry E. Townsend, deceased
Application October 20, 1932, Serial No. 638,741
4 Claims. (Cl. 215—38)



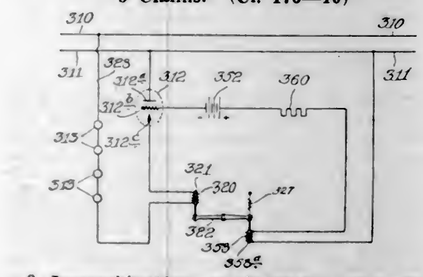
4. In a package of the class described, a receptacle having a mouth, outwardly extending projections spaced apart around and below the mouth, a closure for the receptacle having a top, a resilient and flexible crown depending from the top and encompassing the mouth of the receptacle having a smooth inner face of slightly less perimeter than the perimeter of the mouth at the projections, a horizontal flange extending outward from the lower edge of the crown, and a rounded corner between the crown and the flange whereby as the closure is seated on the receptacle the crown is locally sprung outward at and by the projections, the closure being held in yieldable, frictional engagement with the projections by the greater rigidity of the horizontal flange.

2,099,711
HERMETICALLY SEALED PACKAGE
Harry E. Townsend, Brooklyn, N. Y.; Title Guarantee and Trust Company executor of the estate of said Harry E. Townsend, deceased
Application February 18, 1933, Serial No. 657,388
10 Claims. (Cl. 215—38)



1. In a package comprising a receptacle of the type having a mouth portion, an annular shoulder adjacent the lower end of said mouth portion, an elastic gasket positioned on the annular shoulder, and a closure having a crown portion slightly larger than said mouth portion and having a resilient skirt adapted to compress the gasket on the annular shoulder, said closure being applied by forcing it downwardly over the mouth of the receptacle, the improvement which comprises a plurality of projections formed on the receptacle below said annular shoulder, said skirt extending downwardly over and frictionally engaging said projections under tension.

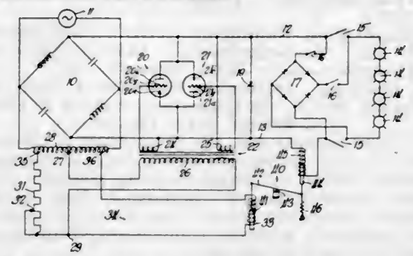
2,099,712
METHOD OF MAKING PISTON RINGS
Frederick W. Wilkening, Narberth, Pa., assignor to Wilkening Manufacturing Company, Philadelphia, Pa., a corporation of Delaware
Application January 12, 1933, Serial No. 651,328
Renewed July 15, 1936
4 Claims. (Cl. 29—156.63)



1. The method of making piston rings which consists first facing the rings on two sides to form plane parallel side walls, then clamping the ring on its two plane parallel side walls, in turning into the outer periphery of the piston ring a pair of parallel-side-walled and overlapping annular grooves at oppositely inclined angles with respect to a plane intersecting the axis of the ring at a right angle and centrally of said parallel side walls, until the inner walls of each of said pair of grooves are adjacent to each other and each abut said plane, thereby to provide a single groove having outwardly converging side walls, drilling a series of generally round and radially disposed passageways through the piston ring, in a direction generally parallel to the aforementioned plane and symmetrically with respect thereto, with the outer ends of said passageways terminating in the channel thus formed, splitting the ring at one point so as to break the continuity thereof, and tensioning the ring by first expanding the ring to a suitable extent and then heating the ring while in the expanded condition, to set it in said condition.

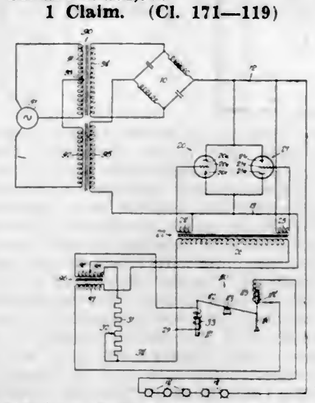
2,099,713
DEVICE FOR SOLVING RELATIVE MOVEMENT PROBLEMS
Russell Willson, United States Navy
Application February 3, 1937, Serial No. 123,871
40 Claims. (Cl. 33—76)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

29. A device for solving relative movement problems, comprising in combination a member provided with a line, a first family and a second family of curves, the direction of the said line representing the course of a moving object relatively to which a second object is to move and the families of curves representing respectively course angles of the second object with respect to the first and loci of ratios of the speed of relative movement of the second object to the actual speed of the first object, each of said curves of the first family of curves and each of said curves of the second family of curves being constructed for various ratios of the actual speed of the second object to that of the first and respectively for a predetermined course angle and ratio of the speed of relative movement of the second object to the actual speed of the first object by a system of polar coordinates, the radial ordinate of which represents the ratio of the actual speed of the second object to the actual speed of the first object and the angular ordinate the direction of relative movement of the second object, a second member movably associated with said first mentioned member for cooperation with the two families of curves and provided with a series of markings which represent various ratios of the actual speed of the second object to that of the first, the said markings being placed on said second mentioned member with a scale equal to that used in determining the length of the radial ordinate of the system of polar coordinates.



2,099,714
CURRENT CONTROLLING APPARATUS
Hugh E. Young, Chicago, Ill.
Application March 1, 1933, Serial No. 659,180
3 Claims. (Cl. 176—10)

3. In combination, an alternating current supply line, a normally closed direct current work circuit of variable resistance comprising a plurality of series connected incandescent lamps and a grid controlled tube conductively connected in series, said tube having a grid and a plate and being rendered conductive by excitation of its grid to conduct current during half cycles of the same polarity whereby the load circuit is traversed by direct current only, a grid excitation circuit, means energized from said supply line for applying grid potential to said excitation circuit synchronously with the application of alternating potential of one polarity to said plate, a solenoid connected in series in said work circuit having a core movable by current flow through said solenoid, spring means controlling the position of said core to counterbalance the pull thereupon for various positions thereof, and means comprising a variable inductance having a movable core mechanically connected to the core of said solenoid for shifting the phase of grid excitation substantially instantaneously to keep the effective current flow in the work circuit substantially constant throughout all variations in resistance of the work circuit to which it is subjected.



2,099,715
CONSTANT CURRENT SYSTEM
Hugh E. Young, Chicago, Ill.
Application May 12, 1936, Serial No. 79,329
20 Claims. (Cl. 175—363)

1. In combination, an alternating current supply circuit, a substantially constant current load circuit, a monocyclic square connecting said supply circuit with said load circuit, means for regulating the current in the load circuit by a variable by-pass directly in shunt across the constant current side of the monocyclic square comprising electric valve means, and means responsive to the current flow in said load circuit for controlling said electric valve means.

5. In combination, an alternating current supply circuit, a substantially constant current load circuit, a monocyclic square connecting said supply circuit with said load circuit, current regulating means for controlling the current of said supply circuit comprising a plurality of grid controlled arc rectifying tubes connected between the load terminals of said monocyclic square, a phase shifting network coacting with the grids of said tubes for controlling the conduction period of each tube, and means responsive to the current of said load circuit for controlling said phase shifting network.

2,099,716
CONSTANT CURRENT SYSTEM
Hugh E. Young, Chicago, Ill.
Original application May 12, 1936, Serial No. 79,329. Divided and this application April 5, 1937, Serial No. 134,970
1 Claim. (Cl. 171—119)

A constant current system comprising, in combination, transformer means having primary windings Scott connected to a three phase source of alternating current and two secondary windings, a monocyclic square connected for energization across one of said secondary windings, circuit means for connecting a load circuit requiring substantially constant current across said monocyclic square through the other secondary winding, variable conducting means directly connected across said load circuit, and regulating means disposed to be responsive to the current flow in said load circuit for controlling the conductivity

of said variable conducting means to maintain the load current substantially constant on variation of the voltage or frequency of said alternating current source.

2,099,717

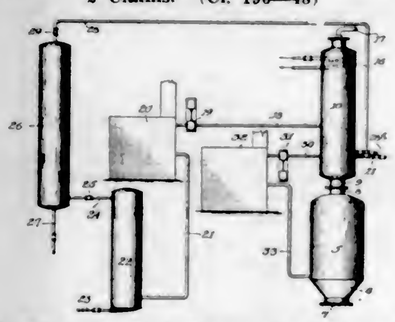
PROCESS FOR THE PRODUCTION OF WATER-SOLUBLE CONDENSATION PRODUCTS

Richard Alles, Mannheim, Germany, assignor to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

No Drawing. Application November 5, 1935, Serial No. 48,336. In Germany November 9, 1934

16 Claims. (Cl. 149—5)

1. The process for the production of water-soluble condensation products suitable as tanning agents which comprises treating cellulose sulphite waste liquor with a phenolic body of the benzene series, an organic sulphonic acid and a low molecular aliphatic compound containing at least one carbonyl group.



2,099,718

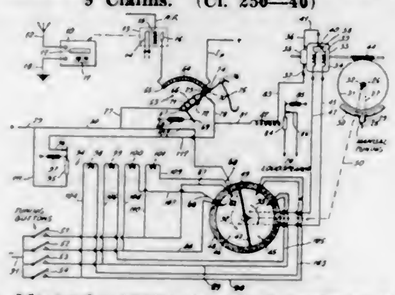
DECOMPOSING HYDROCARBON OILS

William H. Bahlke, Robert F. Ruthruff, and Frederick W. Sullivan, Jr., Hammond, Ind., assignors to Standard Oil Company, Whiting, Ind., a corporation of Indiana

Application April 29, 1931, Serial No. 533,776

2 Claims. (Cl. 196—48)

1. The method of decomposing hydrocarbon oils to form low boiling products therefrom which comprises maintaining residual oil products in a decomposing zone at a temperature to effect decomposition thereof into coke substantially free from liquid products, removing vapors therefrom and contacting said vapors in a dephlegmating zone with fresh oil containing residual products, thereby vaporizing a portion of said fresh oil and heating the unvaporized residual constituents thereof, combining the vaporized portion with said vapors outside of said decomposing zone, discharging said unvaporized residual constituents into said decomposing zone to be coked therein, subjecting the combined vapors from said zone and from the fresh oil to fractionation in a fractionation zone to form therefrom a plurality of condensate fractions of intermediate boiling point range free from said unvaporized residual constituents, leaving a low boiling point fraction uncondensed, heating a lighter condensate thus separated to vaporizing and cracking temperature under pressure to effect conversion thereof, directing the resultant products of conversion into a separating zone, separate and apart from said decomposing, dephlegmating and fractionating zones, in which separating zone said products of conversion are separated into vapors and residue, commingling the separated vapors with the combined vapors removed from the decomposing zone and from the fresh oil, to be subjected to fractionation, heating a heavier one of said condensates to cracking temperature and discharging it into the decomposing zone to maintain the desired decomposing conditions therein.



2,099,719

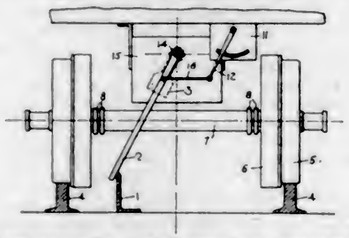
PRESELECTIVE TUNING FOR RADIO RECEPTION AND THE LIKE

Thomas A. Banning, Jr., Evanston, Ill., assignor to Radio Corporation of America, a corporation of Delaware

Application June 21, 1933, Serial No. 676,804

9 Claims. (Cl. 250—40)

1. Means for tuning a radio receiver to a selected station having substantially a given frequency of radio frequency signals, comprising means to tune said receiver roughly to the tuning position for reception of such signals, means supplemental thereto operative to complete the tuning operation substantially to the exact frequency of the incoming signals, said last named means comprising means responsive to a change of plate discharge current of a radio frequency tube of the receiver and operative to discontinue the tuning operation substantially at the point of minimum plate discharge current of said tube.



2,099,720

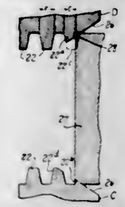
APPARATUS FOR STABILIZING HIGH SPEED TRAINS

Karl P. Billner, New York, N. Y.

Application March 13, 1935, Serial No. 10,904

2 Claims. (Cl. 104—242)

1. Apparatus for stabilizing high speed trains in rounding curves, means carried by the train for magnetically increasing the tractive effect substantially in proportion to developed centrifugal forces tending to derail the train and means responsive to the centrifugal force for controlling the magnetic effect, in combination with a guide starting at a straight portion of a track immediately adjacent the curve from a point near the inside rail, said guide being arranged obliquely of the rails so as to approach the outside rail at or near the commencement of the curve and a swinging arm carried by the train, said arm cooperating with said guide to so control the magnetic effect that the desired increase in traction is secured at or before the entrance of the train into the curve.



2,099,721

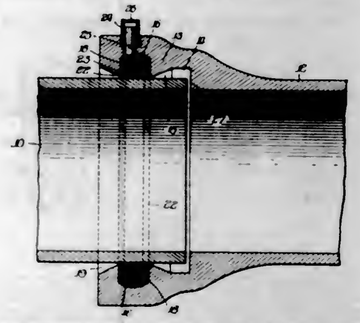
THREAD CUTTING CHASER

Albert F. Breitenstein, New Haven, Conn., assignor to The Geometric Tool Company, New Haven, Conn., a corporation of Connecticut

Application June 1, 1936, Serial No. 82,717

6 Claims. (Cl. 10—103)

1. A thread-cutting chaser having a plurality of thread-cutting teeth, including a front thread-cutting tooth, offsetting therefrom; the said front tooth having its advance face chamfered and also having a further portion of its advance face cut away to provide a checking-shoulder intersecting and extending at an angle to the chamfered portion of the tooth.



2,099,722

PIPE JOINT

John A. Byers, Evanston, Ill., assignor to James B. Clow & Sons, Chicago, Ill., a corporation of Illinois

Application January 2, 1936, Serial No. 57,140

3 Claims. (Cl. 285—163)

1. A pipe joint comprising a bell member, a spigot member for entrance into said bell member, said bell member having an annular recess formed in the interior wall thereof, a gasket of elastic material adapted to fit within said recess and having encircling association with said spigot member, said gasket having a cavity therein, a valve stem fixed to the gasket and communicating with the cavity, said valve stem providing for the injection of a solidifiable liquid into the cavity to inflate the gasket whereby said gasket is forced into contact with the spigot member to form a tight joint, and tapering surfaces provided by the interior wall of the bell member on opposite sides of the recess to increase the clearance space between the bell and spigot members.

2,099,723

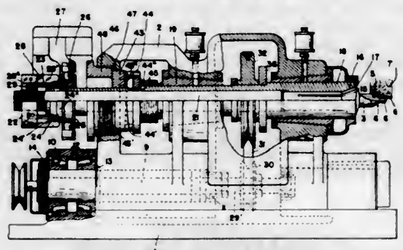
90° BEND, FLEXIBLE PIPE CLEANING TOOL

Andrew J. Carver, Walters, Okla.

Application September 18, 1936, Serial No. 101,441

8 Claims. (Cl. 15—104.06)

1. A pipe working tool including a series of abutted, scraper-carrying body sections and a piston assembly, a flexible element threaded axially through and on which the sections and assembly are slidable and have relatively free rotation as to each other, a stop on said element to limit end shift of the said series and assembly, and means acting against and to hold the sections and assembly in abutted relation and yieldingly press them in one direction along said element toward said stop.



2,099,724

MACHINE FOR GRINDING TOOLS

Stuart A. Cogsdill, Detroit, Mich., assignor to Cogsdill Manufacturing Company, Inc., Detroit, Mich., a corporation of Michigan

Application August 5, 1935, Serial No. 34,818

7 Claims. (Cl. 51—94)

1. A machine for grinding cutting tools, comprising an abrasive member, a support rockably movable toward and away from said abrasive member, a holder for a tool rotatably carried by said support and adapted to position the tool for engagement by said abrasive member, means for rocking said support toward said abrasive member to establish and maintain engagement of the tool with said abrasive member, a cam rotatable with said holder, a member engageable with said cam upon movement of said support toward said abrasive member to cause said support to periodically move away from said abrasive member, and adjustable means controlling said member for varying the movement of said support toward said abrasive member.

2,099,725

SCRATCH RECORDER

Alfred V. de Forest, Southport, Conn., assignor to Baldwin-Southwark Corporation, a corporation of Delaware

Application December 4, 1934, Serial No. 755,913

6 Claims. (Cl. 234—70)

1. A scratch recorder comprising a target having a clip bar and a recording surface, a marker arm extending beneath said clip bar and on top of said recording surface, means whereby said

marker arm and target may be attached to a specimen subjected to strain variations thereby to effect relative longitudinal movement between

said arm and target, and means for biasing said marker arm so that it traverses said surface upon occurrence of said relative movement between said marker arm and target.

2,099,726

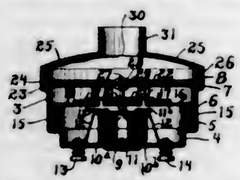
PAPER AND METHOD OF MAKING SAME

Lloyd L. Dodge, Rhinelander, Wis., assignor to Rhinelander Paper Company, Rhinelander, Wis., a corporation of Wisconsin

No Drawing. Application June 20, 1935, Serial No. 27,541

3 Claims. (Cl. 92—40)

1. In the method of making a waxed paper of enhanced transparency and pliability from relatively free, only partially hydrated paper stock by successively forming the stock into a paper web having its fibers lying largely in the machine direction, drying, moistening and super-calendering said web, the steps which comprise subjecting said web a plurality of times to treatment with wax; first applying an aqueous wax emulsion to said web during said drying step and thereafter completing the drying of said web; secondly, passing the once waxed and super-calendered web through a bath of molten wax, winding said waxed web into a roll and maintaining the same at a temperature above the fusing point of the wax for a short time, and thirdly passing said waxed web from said roll into a second molten wax bath to level off and smooth the surface of said waxed web.



2,099,727

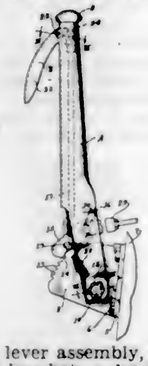
TELEPHONE RECEIVER

Archibald A. Duncan, Akron, Ohio

Application April 5, 1934, Serial No. 719,130

3 Claims. (Cl. 179—114)

1. In a telephone receiver, an electromagnet having a horseshoe core terminating at each end thereof in laterally projecting pole pieces, a soft iron armature positioned in spaced operative relation to said pole pieces, a permanent magnet having a spring bracket on each end thereof, a soft iron pole piece on each bracket, said armature mounted with its ends in close, spaced relation to and in the lateral plane of the pole pieces of said permanent magnet, each pole piece of said permanent magnet being positioned in close spaced relation to the pole piece at the opposite pole of the electromagnet, a diaphragm and member operatively connecting the armature to the diaphragm.



2,099,728

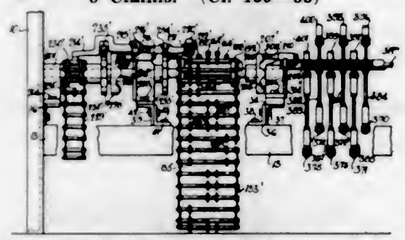
BRAKE LEVER

Charles Robert Duncan, Waukegan, Ill., assignor to Oakes Products Corporation, North Chicago, Ill., a corporation of Michigan

Application December 13, 1935, Serial No. 54,173

3 Claims. (Cl. 74—537)

1. In a brake lever assembly, a bracket, a lever pivoted to said bracket, a lever pivot bolt connecting said lever to said bracket, a nut on said bolt, a pawl pivoted to said lever, a pawl spring having one end connected to said pawl and the other end passing through an opening in said bolt and engaging said nut with hook action to prevent loosening of the nut on the bolt and for securing said end of said spring in place.



2,099,729

PATTERN CONTROL AND SHEDDING MECHANISM FOR LOOMS

Eugene P. Floyd and Arthur G. Hackney, Tucapau, S. C., assignors of one-half to C. C. Wyche, Donald Russell, Sam J. Nichols, and Alfred Moore, all of Spartanburg, and George Hill, Wellford, S. C.

Application September 10, 1934, Serial No. 743,431

8 Claims. (Cl. 139—55)

1. In a loom having a plurality of harnesses, means for selectively positioning said harnesses to form sheds comprising a pattern drum for controlling the positioning of said harnesses, means for advancing said pattern drum, means for reversing said pattern drum and means for oscillating said pattern drum.

2,099,730

ARTICLE OF JEWELRY

Louis Garfinkel, Providence, R. I., assignor to T & R Jewelry Co., Providence, R. I., a corporation of Rhode Island

Application July 23, 1936, Serial No. 92,168

7 Claims. (Cl. 63—1)

1. An article of jewelry comprising a supporting member, an ornament having spaced channels

forming a guideway, said member being slidable in the guideway between the channels to mount the ornament on the member, a resilient tongue on one of the parts provided with a detent at its free end, and said other part having a recess en-

gaged by the detent to hold the ornament in position on the member, said tongue and recess being positioned between the channels and said tongue being movable at an angle to the plane of the part on which it is carried.

2,099,731

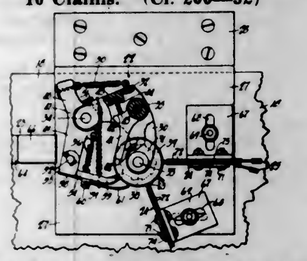
SKI PLANE

Louis Gelbman, Yonkers, N. Y.

Application September 12, 1936, Serial No. 100,421

8 Claims. (Cl. 280—8)

1. In a ski plane a body for a rider to sit on, a main ski attached along the longitudinal center of said body for running on snow or ice and upon which a rider may balance himself, arms transversely of said body and movably mounted upon said body to move in planes transversely of said body, a support ski element on each side of said main ski and mounted upon said arms and adapted to move arcuately upwards and outwards and resilient means urging said support skis downwards against the snow or ice.



2,099,732

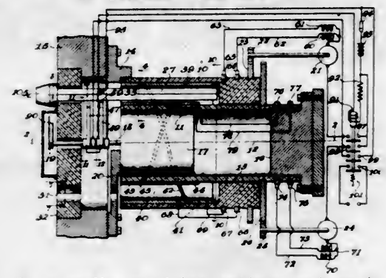
DISPENSER CONTROL MEANS

Joseph M. Gordon, South Bend, Ind., assignor of one-half to Leland E. Line, South Bend, Ind.

Application March 30, 1936, Serial No. 71,764

10 Claims. (Cl. 200—52)

1. Means for controlling a dispenser associated with a coin controlled device to operate said dispenser once for each predetermined number of operations of said coin controlled device, comprising primary and secondary members rotatable step-by-step, said secondary member being associated with said primary member to normally rotate one step for each revolution of said primary member, means for actuating said primary member, a control switch comprising spaced resilient contacts, means carried by said secondary member for pressing said contacts into engagement, and means cooperating with said first named actuating means for rotating said secondary member one step upon the operation of the primary member immediately following engagement of said contacts.



2,099,733

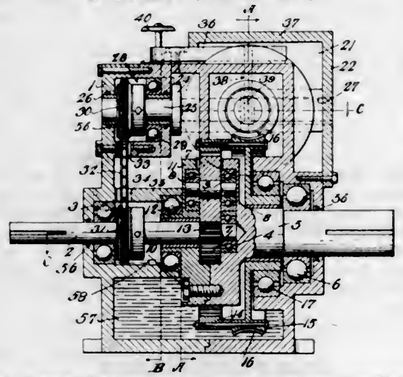
TUNING APPARATUS FOR RADIO RECEIVERS

Harold D. Gregory, Haddon Heights, N. J., assignor to Radio Corporation of America, New York, N. Y., a corporation of Delaware

Application April 1, 1932, Serial No. 602,548

11 Claims. (Cl. 250—20)

5. In a radio receiving system, rotary tuning means therefor, an electric motor for driving said tuning means, and switch means for controlling the motor circuit, said switch means comprising a drum driven by said motor and individual control pins, each having a contact adjustable along its length, adaptable for placement at different radial positions with respect to said drum and operable dependently upon said positions and contact adjustments to determine the controlling action with respect to the motor circuit.

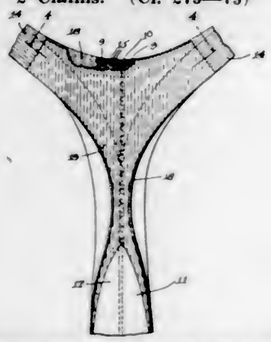


2,099,734

VARIABLE SPEED GEAR TRANSMISSION

Charles O. Hall, East Orange, N. J.

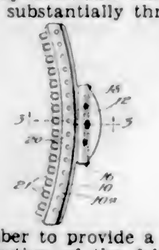
Application May 25, 1935, Serial No. 23,370



1 Claim. (Cl. 74—285)

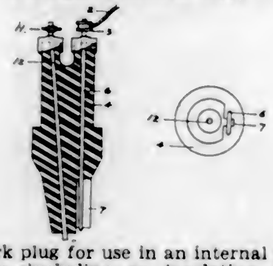
A power transmission construction combining an input shaft, a pinion attached thereto, a gear assembly, a torque reaction member having a worm gear secured thereto, a separate transmission for driving a hollow countershaft from the input shaft, a driven flanged output shaft, an oil containing housing to enclose all these parts, having oil seals at the apertures through which the shafts protrude, a driving friction disc on a slidably keyed shaft within the said countershaft and rotated thereby, a driven disc on another shaft positioned right angularly to said

countershaft having the driven disc contactable with the driving disc, a worm secured to said right-angle shaft which engages the worm gear attached to and of larger diameter than the torque reaction member whereby rotative motion is transmitted to the torque reaction member, a separate housing applied securely to the oil containing housing, providing a protective chamber for the friction mechanism, means for adjusting the driving friction disc forward and back across the face of the driven disc from its periphery to a position relatively nearer its axis, a pivoted lever having a handle, a pin through said lever positioned to engage a circular keyway in the driving disc shaft, to engage the driving disc with the driven disc at various radii of the driven disc.



2,099,735
PLAYING RACKET
Horace W. Hall, Newton, Mass.
Application April 8, 1936, Serial No. 73,254
2 Claims. (Cl. 273—73)

1. A racket comprising a bow head, throat and handle, a portion of said racket below said bow head curving inwardly at its outer sides, and two reinforcing laminations on said racket, one above the other, extending from the lower portion of said bow head downwardly on said throat to said handle, a portion of each said reinforcing lamination curving inwardly at its outer sides to a greater extent than the said inward curving of the adjacent portion of said racket and then curving outwardly, the upper said lamination being narrower in width for a portion of its length than the lower said lamination and so positioned that a portion of each side of said lower lamination is visible below said upper lamination, the grain of said lower lamination extending substantially laterally across said throat and handle and the grain of said upper lamination extending substantially longitudinally.



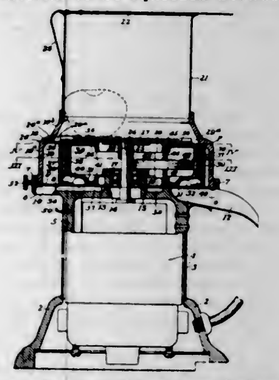
2,099,736
HAIR WAVING DEVICE
Walter H. Hermsdorf, Chicago, Ill., assignor to Chain Store Products Corporation, Chicago, Ill., a corporation of Delaware
Application April 16, 1936, Serial No. 74,660
5 Claims. (Cl. 132—31)

1. In a device of the character described, a pair of elongated spring-pressed pivotally connected hair-gripping members, the bottom edges of said members being provided with teeth, the inner surfaces of members, adjacent said bottom edges, contacting each other in the closed position of said members, the inner surface of one member, immediately above said contact area, extending outwardly substantially throughout the

length of the member to provide a longitudinal space for the reception of the folded or bent portion of the hair gripped between said members.

2,099,737
SPARK PLUG CORE
Albert Joseph Hopkins, Toronto, Ontario, Canada
Application September 16, 1935, Serial No. 40,792
3 Claims. (Cl. 123—169)

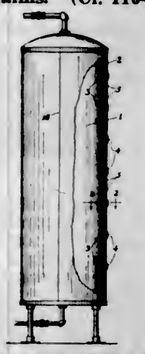
1. A spark plug for use in an internal combustion engine, including an insulating core, an electrode extending through the core and projecting therefrom at the lower end thereof, a heating element positioned exteriorly of said core for a portion of its length adjacent to and above the projecting lower end of said electrode, and thereafter extending upwardly through said core in spaced relation to said electrode, and means connecting said heating element in the electric circuit.



2,099,738
ALKYLATION OF TRIHYDRIC PHENOLS
Vladimir Ipatieff, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
No Drawing. Application June 30, 1934, Serial No. 733,335. Renewed May 26, 1936
6 Claims. (Cl. 260—154)

1. A process for the treatment of tri-hydric phenols to produce alkyl derivatives thereof which comprises, subjecting the said tri-hydric phenols to the action of an olefinic hydrocarbon in the presence of an acid of phosphorus.

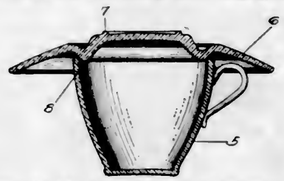
2,099,739
EXTRACTION OF JUICE FROM VEGETABLE PULP AND LIKE MATERIALS
Clarence E. Jenkins, Keene, N. H., assignor, by direct and mesne assignments, to Bocji Corporation, Trustee, Pittsburgh, Pa., a corporation of Delaware
Application January 17, 1934, Serial No. 706,976
39 Claims. (Cl. 100—47)



1. Apparatus of the class described comprising inner and outer cylindrical members one of which is eccentrically positioned within the other, and means for moving one of said members in a gyratory path with respect to the other, one

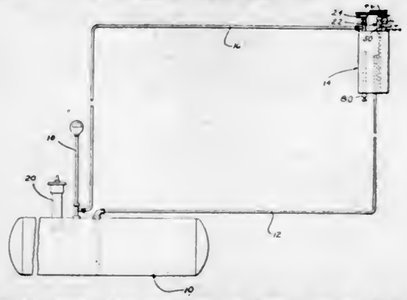
of said members having a wall portion over which the other member moves and which serves to confine material to be squeezed between the two

members, and an open space being provided through which material to be squeezed may be introduced between the said inner and outer members.



2,099,740
THERMAL INSULATION
Henry A. Kieselbach, Montclair, N. J., assignor to Johns-Manville Corporation, New York, N. Y., a corporation of New York
Application February 23, 1935, Serial No. 7,775
3 Claims. (Cl. 116—114)

1. An assembly comprising a heated tank to be insulated, a layer of thermal insulation disposed therearound and means for indicating by finger touch the approximate temperature of the tank, the said means comprising an element in contact with the tank, an element exposed on the outside of the insulation and constituting a readily accessible tangible temperature indicator, and a union member, of area of cross section very small in proportion to the area of either of the said two elements, connecting the said elements and the said elements and union member being each of high specific thermal conductance of the order of that of metals.



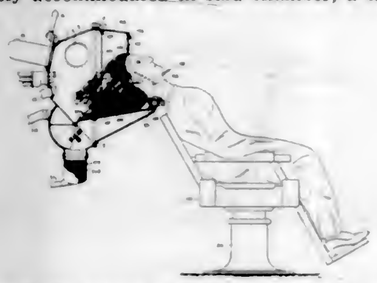
2,099,741
SAUCER FOR CUPS
Hyman Klayf, Chicago, Ill.
Application May 20, 1936, Serial No. 80,658
1 Claim. (Cl. 65—13)

A saucer for a cup, said saucer having a concavo-convex section and having provided adjacent and beyond the central portion of the concave surface upon which a cup is normally supported means for entering and engaging the top

of the cup so as to prevent relative movement when the saucer is inverted and placed on the top of the cup.

2,099,742
REMOTE FEED FOR LIQUID FUEL
Albert H. Klesa, Stow, Ohio
Application September 7, 1934, Serial No. 743,096
6 Claims. (Cl. 158—81)

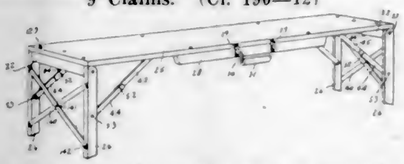
1. A tank for use in a liquid-fuel system, which tank contains liquid fuel and air under pressure, a mixing valve in the tank for commingling the liquid fuel and air under pressure, an air valve for controlling the supply of air to the tank and gear means for coordinating the action of the mixing valve and the air valve so that the mixing valve will be open completely when the air valve is shut and vice versa, and so both valves may be partially open at the same time.



2,099,743
WATER SOFTENER
Ellwyn C. Kroeger, Newton, Iowa, assignor to The Maytag Company, Newton, Iowa, a corporation of Delaware
No Drawing. Application July 15, 1936, Serial No. 90,757
2 Claims. (Cl. 210—23)

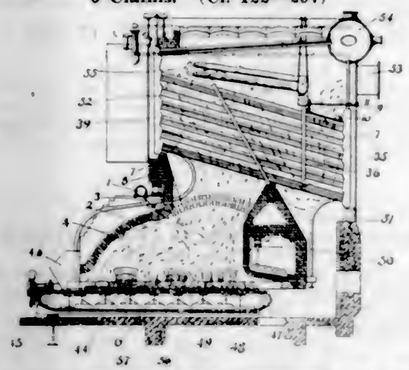
1. A water softener consisting of an intimate mixture of sodium meta silicate and sodium carbonate in approximately the relative proportions of 50 to 85% of sodium meta silicate and 15 to 50% of sodium carbonate.

2,099,744
METHOD OF AND MEANS FOR EXTERIOR BODY TREATMENTS
Hans Lohr, Jackson Heights, N. Y., assignor to Filior Famous Facial Corporation, Long Island City, N. Y., a corporation of New York
Application July 16, 1930, Serial No. 468,237
In Germany July 17, 1929
36 Claims. (Cl. 128—172)



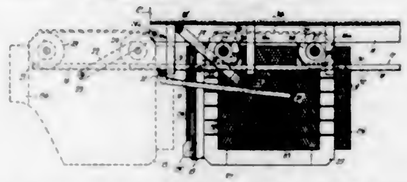
30. In combination with a treatment chamber into which part of the head is adapted to be

sealed, and with a plurality of dispensing means issuing upon and with massage means operatively accommodated in said chamber, a timing



mechanism controlling said means and chronologically separatedly starting and stopping said means.

2,099,745
COLLAPSIBLE BENCH AND TABLE STRUCTURE
William H. Lykins, Covington, Ind.
Application September 27, 1934, Serial No. 745,660
9 Claims. (Cl. 190—12)



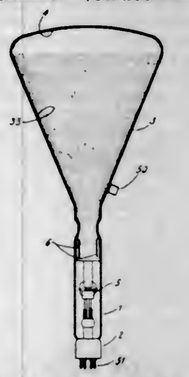
1. A container forming bench including a bench seat, pairs of legs at each end thereof and pivotally associated therewith and each pair being foldable inwardly toward each other, side rails each aligned with the legs on its side and carried by the underside of said seat and terminating short of the ends thereof by a distance from each end at least equal to the lengtn of a leg, said legs when collapsed and said side rails forming with said seat a section of a container for carrying purposes.

2,099,746
MEANS FOR INCREASING THE EFFICIENCY OF BOILERS
Augustus Mayer, Springfield, Ill.
Application September 6, 1935, Serial No. 39,440
6 Claims. (Cl. 122—297)

1. As an improvement in commercial type water tube boilers having a boiler supporting and fire box defining wall, a controllable mechanical source of air projecting energy, and communicating channels for conducting fresh air from said mechanical projector up under burning fuel in the fire box and an outlet in said boiler supporting wall for the hot products of combustion; an auxiliary fresh air supply system and a control system for a uniform distribution and means for regulating both systems in effective harmony comprising a fresh air supply duct, a plurality of spaced air distributing pipes extending through said fire box wall and control valves in each; said air duct communicatively connected with said air supply channels to the outside of said wall and a damper in said air supply duct for controlling the supply of air to said air distributing pipes, a plurality of channeled dampers each having an integral control lever, a pair of parallel metallic plates pivotally supporting said dampers and disposed at right angles across the top of said water tubes of the boiler so as to normally register said channel dampers over the space between said water tubes, means for manually adjusting said channel dampers in the optional control of the distribution of the hot products of combustion among the water tubes of the boiler before they leave the outlet therefor.

2,099,747
AIR CONDITIONING MEANS
Lee W. Melcher, Waukesha, Wis., assignor to Waukesha Motor Company, Waukesha, Wis., a corporation of Wisconsin
Application June 4, 1936, Serial No. 83,577
9 Claims. (Cl. 62—117)

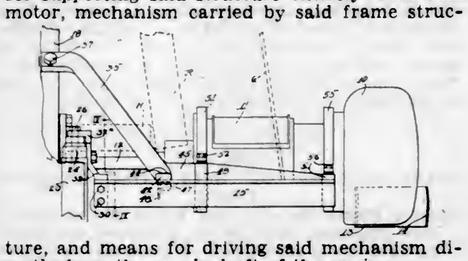
1. In combination with a vehicle having cooling means therefor, of a mounting connected to and suspended from the bottom of the vehicle, a refrigerator unit comprising a compressor for supplying compressed refrigerant to the cooling means and a prime mover for driving the compressor, and supported by the mounting so that it is bodily shiftable from a normal operating position wherein it is disposed directly beneath the bottom of the vehicle into a position wherein it is disposed outwardly of the vehicle and the compressor and prime mover are readily accessible, and means for releasably holding the unit in its operating position.



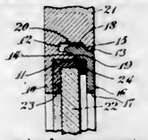
2,099,748
EYEGLASS FRAME
Paul Mertens, Newark, N. J.
Application April 27, 1936, Serial No. 76,572
3 Claims. (Cl. 88—47)

1. In an eyeglass frame, a lens supporting rim section having a peripheral wall and a ledge portion springing from its front marginal portion in

right angular relation thereto thereby to provide a rearwardly open lens receiving and supporting seat to embrace a portion of the lens perimeter and marginal portions of its front face, spaced apart coupling bosses within the angle of said seat projecting rearwardly from and being integral with said ledge portion and parallel to said peripheral wall to extend into corresponding openings provided in the lens to be engaged in said seat, thereby to retain the applied lens against outward displacement relative to said peripheral wall, said coupling bosses having axially disposed internally screw-threaded bores, perforate clip-plates for application over the rear face of the applied lens in alignment with said coupling boss bores, said clip plates having end portions bearing on the peripheral wall of the rim section and headed fastening screws, the shanks of which pass through said clip-plates and screw into said coupling boss bores, thereby to retain said lens against rearward displacement relative to said ledge portion.



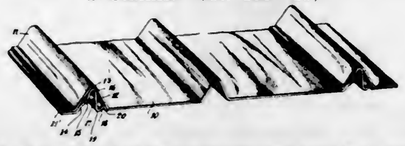
2,099,749
ELECTRON TUBE
Richard T. Orth, Orange, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application May 30, 1933, Serial No. 673,572
3 Claims. (Cl. 250—27.5)



3. A cathode ray tube comprising a surface for emitting a stream of electrons, a target positioned in the stream and adapted to luminesce under impact of the electrons, means to focus the emitted electron stream on the target, means to limit and fix the boundary area of the instantaneously impinging electrons and electrode means acting only within the emitted electron stream to variably remove under the control of signals the electrons from the inner portion of the boundary area of impact to vary the intensity of the luminescent effects produced.

2,099,750
GOVERNOR CLUTCH DRIVE MECHANISM SUPPORT
Ralph F. Peo and William D. Drysdale, Buffalo, N. Y., assignors to Houde Engineering Corporation, Buffalo, N. Y., a corporation of New York
Application January 17, 1936, Serial No. 59,500
8 Claims. (Cl. 180—53)

1. In a motor-propelled vehicle having a radiator at the front end thereof, a motor resiliently mounted on said vehicle behind the radiator, a frame structure in front of said radiator, means for supporting said structure entirely from said motor, mechanism carried by said frame structure, and means for driving said mechanism directly from the crank shaft of the engine.



2,099,751
WINDOW CONSTRUCTION
Francis J. Plym, Niles, Mich., assignor to The Kawneer Company, Niles, Mich., a corporation of Michigan
Application April 3, 1936, Serial No. 72,619
3 Claims. (Cl. 20—56.4)

1. In a metal window construction, a setting for a pane of glass comprising a member provided with a glass retaining flange for one face of the setting, a lip provided at the opposite face of the setting and a shoulder intermediate the flange and lip, the shoulder and lip providing a recess therebetween, and a rigid metal stop having a glass retaining flange for the opposite face of the setting and a projection adapted to be received in the recess and interlock with a side of the shoulder and lip for retaining the stop in position.

2,099,752
SHEET METAL ROOFING
Verdon Thomas Renner, Parkersburg, W. Va., assignor to The Parkersburg Iron and Steel Company, Parkersburg, W. Va., a corporation of West Virginia
Application February 25, 1936, Serial No. 65,591
2 Claims. (Cl. 108—18)

1. A lapped joint for sheet metal roofing, comprising adjacent sheets, one of which is provided at one edge with an overlapping inverted V-shaped member having a convex crown portion and adjoining straight flat sides, and an unsymmetrical lapped member on an edge of the adjacent sheet; said lapped member consisting of a crown portion for nesting in and supporting said convex crown portion and adjoining major and minor legs, said major leg sloping upwardly from the sheet and having a preponderance of its surface in direct contact with the overlapping terminal leg, and a minor portion of said surface out of contact with said leg, and a base margin in surface contact with the terminal margin of said terminal leg, said minor leg sloping downwardly

and provided with a terminal formation comprising a relatively small inverted U-shaped foot connected to said minor leg by a U-shaped drainage trough, the outer side of said foot being of plane formation and providing a terminal surface in direct contact with the base portion of the remaining leg of said overlapping member.

2,099,753

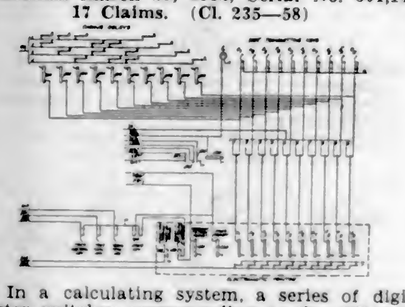
MANUFACTURE OF CELLULOSE DERIVATIVES

Robert Pierce Roberts and Edgar Bertie Johnson, Spondon, near Derby, England, assignors to Celanese Corporation of America, a corporation of Delaware

No Drawing. Application October 23, 1934, Serial No. 749,622. In Great Britain November 23, 1933

5 Claims. (Cl. 260—102)

1. Process for the manufacture of cellulose acetate, which comprises ripening cellulose acetate by incorporating with an acetylation solution of cellulosic material and containing acetic anhydride and an acid catalyst sufficient reagent to destroy excess acetylating agent, allowing the mixture to stand for some time, neutralizing a part of the acid catalyst and incorporating a ripening agent in a proportion of less than 20% of the cellulosic material and continuing ripening until an acetone soluble cellulose acetate having an acetyl content of less than 56% is produced, the conditions of treatment being such that the cellulose acetate produced is capable of being formed into products of increased resistance to the delustering action of hot aqueous solutions.



2,099,754

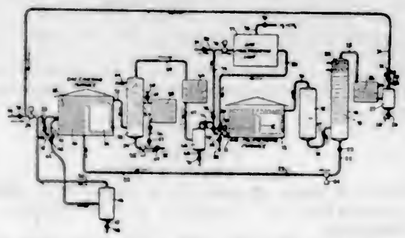
CALCULATING MACHINE

Harold C. Robinson, Chicago, Ill., assignor, by mesne assignments, to Associated Electric Laboratories, Inc., Chicago, Ill., a corporation of Delaware

Application March 25, 1932, Serial No. 601,141

17 Claims. (Cl. 235—58)

1. In a calculating system, a series of digit register switches corresponding to the different orders of digits of a multi-digit number, each register switch having a plurality of positions one for each of the different numerical digits and each register switch always standing in one of those positions, whereby a series of digits is always registered in said series of register switches, means for transmitting a series of impulses corresponding to a series of digits constituting a multi-digit number, said impulses being transmitted in the sequence corresponding to the orders of digits of said number, means responsive to each impulse of said series and controlled by each of said register switches for operating said register switches to positions corresponding to the digits of the sum of the series of digits registered in the register switches and the series of digits represented by the series of impulses, and means whereby said register switches are rendered effective one at a time to control said impulse responsive means and in the digit-order sequence in which said impulses are transmitted.



2,099,755

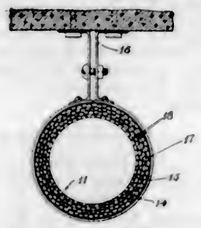
TREATMENT OF HYDROCARBONS

Robert F. Ruthruff, Hammond, Ind., assignor to Standard Oil Company (Ind.), Chicago, Ill., a corporation of Indiana

Application December 13, 1934, Serial No. 757,265

6 Claims. (Cl. 196—10)

1. The process of producing hydrocarbon oil boiling within the motor-fuel boiling-point range from hydrocarbon gases containing gaseous olefins which comprises subjecting said gases to an elevated temperature under high pressure to effect a polymerization of gaseous olefins to normally liquid products, fractionating the products to condense and separate products boiling within the motor-fuel boiling-point range and higher-boiling products, passing higher boiling products thus obtained through a heating zone and subjecting them to a temperature of from 1250° to 1750° F. under a relatively low pressure in the presence of hydrocarbon gases containing paraffins to produce gaseous olefins from said higher boiling products and paraffins, and delivering gaseous olefins thereby produced to the gas-polymerizing step.



2,099,756

AIR DUCT

William R. Seigle, Mamaroneck, N. Y., assignor to Johns-Manville Corporation, New York, N. Y., a corporation of New York

Application October 29, 1935, Serial No. 47,217

5 Claims. (Cl. 138—78)

1. A duct for moisture-containing air comprising fire-resistant fibres felted into a substantially non-resonant sheet material constituting the major part of the wall of the duct and a moisture-proof friction-reducing agent coated over the inner surface of the wall and preventing frictional contact between the said material and the air in the duct.

2,099,757

ESTERS OF FORMALS AND METHOD OF PREPARING THEM

George W. Seymour, Cumberland, Md., assignor to Celanese Corporation of America, a corporation of Delaware

No Drawing. Application July 12, 1933, Serial No. 680,082

9 Claims. (Cl. 260—103)

1. An ester of an acyclic formal of a dihydric alcohol with an isocyclic carboxylic acid.

2,099,758

COMPOSITIONS CONTAINING ESTERS OF FORMALS

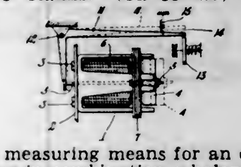
George W. Seymour, Cumberland, Md., assignor to Celanese Corporation of America, a corporation of Delaware

No Drawing. Original application July 12, 1933, Serial No. 680,082. Divided and this application October 17, 1934, Serial No. 748,659. In Canada July 11, 1934

12 Claims. (Cl. 106—40)

1. A composition of matter containing a derivative of cellulose and an aromatic carboxylic acid ester of a formal of a dihydric alcohol.

2,099,759



TIME MEASURING MECHANISM

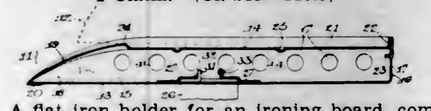
Emil Spahn, Zug, Switzerland, assignor to Landis & Gyr, A.-G., a corporation of Switzerland

Application October 24, 1935, Serial No. 46,492

In Switzerland November 24, 1934

3 Claims. (Cl. 58—26)

1. A time measuring means for an electric circuit including in combination a balance wheel of a clock mechanism, a synchronous motor having a rotor axially movable under the influence of its magnetic driving flux, means normally holding the balance wheel against movement and means for releasing said holding means by axial shifting of the rotor when the flux is interrupted whereby interruption of the power supplied to the motor causes the balance wheel to be released.



2,099,760

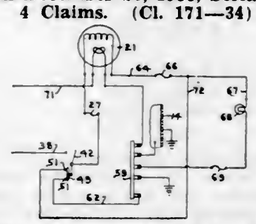
FLATIRON HOLDER

Fred R. Staudle, Milwaukee, Wis.

Application April 8, 1936, Serial No. 73,239

1 Claim. (Cl. 248—117.6)

A flat-iron holder for an ironing board, comprising a flat-iron support adapted to rest on the board, a guide carried by said support, and clamping members on said support engageable with opposite side edges of the board, one of said clamping members being slidable along said guide, said guide having spaced lugs, and said slidable clamping member having a lug intermediate said lugs on said guide, a coiled spring connecting said clamping member lug and one of said lugs on said guide to urge said clamping member inwardly, and the other lug on said guide being engageable with said clamping member lug to limit the outward movement of said clamping member.



2,099,761

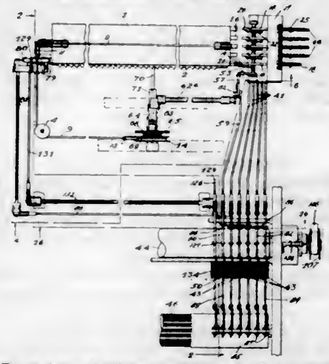
SAFETY SWITCH BOX

Walter F. Sutherlin, Birmingham, Ala., assignor of one-half to G. J. Jebeles, Birmingham, Ala.

Application December 26, 1935, Serial No. 56,194

4 Claims. (Cl. 171—34)

1. In switch apparatus of the character described, a switch box, a meter, terminals in the switch box connected to a power line, to a work circuit and to the ground, terminals in the switch box connected to the meter coils, and a double throw spring pressed switch in the switch box so disposed that when closed on one side the power line is connected to the work circuit through the meter coils, and when closed on the other side the work circuit beyond the meter is connected to the ground.



2,099,762

TYPEWRITING MACHINE

Russell G. Thompson, Rochester, N. Y., assignor to Underwood Elliott Fisher Company, a corporation of Delaware

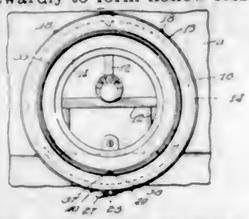
Application August 6, 1934, Serial No. 738,573

49 Claims. (Cl. 197—20)

45. In a typewriting machine, the combination of a carriage, an escapement device, a plurality of letter-feed racks having different letter-spacing, and means for automatically selecting a letter-feed rack and operatively connecting the selected rack with the escapement device according to a predetermined typed-line justifying schedule.

2,099,763

METAL TIRE COVER



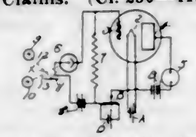
Herbert W. Tinker, Milwaukee, Wis., assignor, by mesne assignments, to Lyon Incorporated, Detroit, Mich., a corporation of Delaware

Application July 30, 1931, Serial No. 553,975

6 Claims. (Cl. 150—54)

1. In a unitary metal tire cover, a pair of sections, one completely circular and continuous, and the other circular and transversely split pro-

viding free ends adjustable toward and from each other, said two sections being connected together only at a point diametrically opposite said free ends and having their adjacent annular edges pressed outwardly to form hollow ribs adapted to



nest one within the other, means associated with said split section for drawing its free ends together to secure said ribs in nested relation, and means for guiding and holding said sections into a predetermined rib-nested position as said first means is actuated.

2,099,764

METHOD OF AND MEANS FOR CONTROLLING ELECTRIC APPARATUS

Enrique G. Touceda, Albany, N. Y.

Application July 30, 1932, Serial No. 626,863
18 Claims. (Cl. 250—41.5)

1. In a device of the character described adapted to determine the passage of an object through a predetermined point in space, the combination with beam projecting means arranged to project a plurality of separate beams in substantially different directions through a zone about said point and which said beams will be intercepted by said object when positioned at said point, of beam responsive means positioned to intercept said beams after they pass said zone.

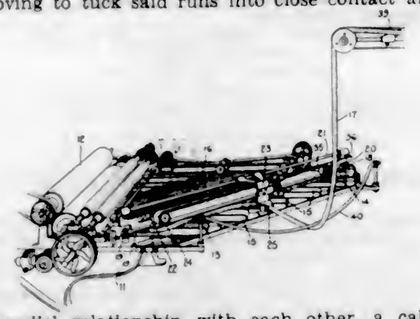
2,099,765

FINISHING TEXTILES

Horst Dietrich Freiherr von der Horst, Leuna, and Ferdinand Muenz and Adolf Vogt, Frankfort-on-the-Main, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

No Drawing. Application December 27, 1933, Serial No. 704,144. In Germany December 29, 1932
9 Claims. (Cl. 91—70)

1. The process of finishing organic textiles which consists in treating them in an aqueous medium with starch in a form capable of yielding a paste and with a substance selected from the class consisting of formaldehyde and compounds yielding formaldehyde under the conditions obtaining and reacting with starch in the warm, and drying the said textiles in the warm while adding an acid-reacting substance.



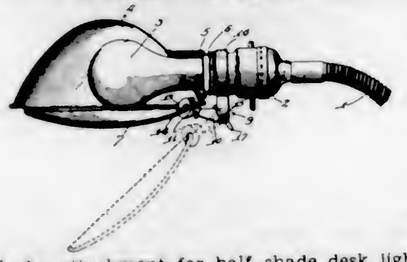
2,099,766

SPUN YARN AND METHOD OF PREPARING SAME

Leon W. Weinberg, Philadelphia, Pa., assignor to Celanese Corporation of America, a corporation of Delaware

Application June 27, 1934, Serial No. 732,621
3 Claims. (Cl. 19—160)

1. In a device of the class described, the combination with an Apperly feed table having a reciprocating carriage for laying a length of roving in a plurality of runs in serpentine form on said table, of means adapted to move with said carriage for acting on alternate runs only of the roving to tuck said runs into close contact and



parallel relationship with each other, a cable adapted to rotate said means, and a spring at each end of said cable for resiliently supporting the same whereby the jar exerted by the reversing of the reciprocating carriage is avoided.

2,099,767

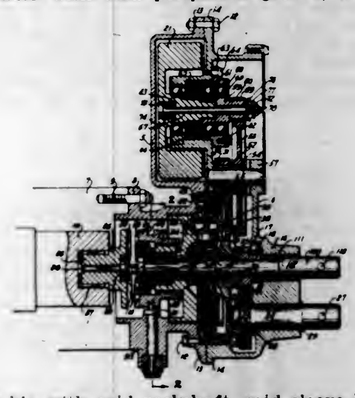
DIFFUSER

George A. Marks, Chicago, Ill.

Application December 14, 1936, Serial No. 115,736
3 Claims. (Cl. 240—108)

1. An attachment for half shade desk lights comprising a concavo-convex diffuser having a peripheral rib on the concave side, a support comprising a clamp portion substantially conforming to the convex side adjacent the periphery of said diffuser, a complemental clamping member arranged to clamp said diffuser inside said rib, means outside the periphery of said diffuser for securing said clamping member to said clamp portion, said clamping member having a groove providing clearance for said rib to enable clamping of said diffuser inside said rib, said clamp portion having an arm extending outwardly beyond said clamping member, interchangeable socket clamping members pivotally mounted on said arm to provide a hinge, and means for adjustably securing said hinge to permit relative frictional adjustment of said diffuser.

2,099,768



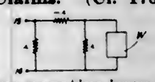
DRIVING MECHANISM

Romeo M. Nardone, East Orange, N. J., assignor to Eclipse Aviation Corporation, East Orange, N. J., a corporation of New Jersey

Original application May 8, 1931, Serial No. 536,031. Divided and this application August 31, 1936, Serial No. 98,799
1 Claim. (Cl. 192—82)

In a rotation transmitting mechanism of the type embodying an axially movable rotatable

clutch member having a peripheral groove, a rockshaft having its axis directed toward said clutch member and also having an extension engageable with said peripheral groove, a sleeve



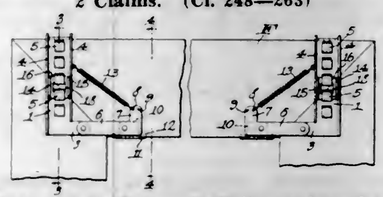
movable with said rockshaft, said sleeve having a pair of angularly spaced notches along its outer surface, and means engageable with said notches to yieldably oppose movement of said rockshaft and sleeve.

2,099,769

CIRCUITS EMBODYING NEGATIVE IMPEDANCE

Harry Nyquist, Millburn, N. J., assignor to American Telephone and Telegraph Company, a corporation of New York

Application June 23, 1936, Serial No. 86,882
4 Claims. (Cl. 178—44)



3. A series type negative impedance circuit having a pair of terminals, a positive impedance connected to the end of said circuit opposite said terminals, a network of Π configuration connected in the circuit between said terminals and said impedance, the series arm of said network being a negative impedance of the series type, and the shunt arms being positive impedances.

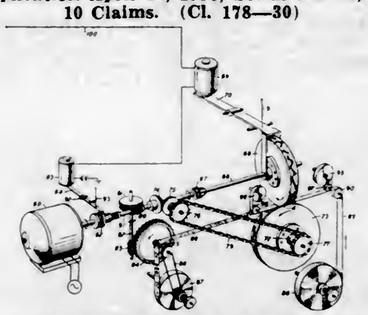
2,099,770

CURTAIN FIXTURE

Charles A. Plaunt, Maywood, Ill.

Application November 28, 1936, Serial No. 113,218
2 Claims. (Cl. 248—263)

2. A curtain fixture including a base having an offset head at one end, a lever pivotally connected to the other end of the base and extending laterally therefrom, resilient means for urging the lever about its pivotal connection and toward the head, a gripping plate pivotally connected to the lever and extending laterally therefrom, said plate and head being positioned to receive the top portion of a window frame there-



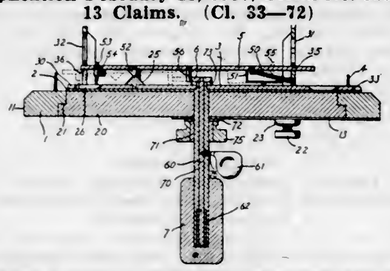
between, and a bracket detachably connected to the base, said bracket including spaced arms of different lengths and an apertured intermediate portion, there being a longitudinal series of hooks outstanding from the base, each hook being proportioned to enter the aperture in the bracket and said bracket being adapted to gravitate on the engaged hook and into engagement with the next adjoining hook thereunder.

2,099,771

PRINTING TELEGRAPH SYSTEM

Wilton Treat Rea, Flushing, N. Y., assignor to American Telephone and Telegraph Company, a corporation of New York

Application April 11, 1936, Serial No. 73,944
10 Claims. (Cl. 178—30)



1. In a telegraph printer, a pair of continuously rotating discs having irregular peripheral edges, a moving recording tape interposed between the peripheral edges of said discs and means for causing the peripheral edges of said discs to contact said moving tape at certain intervals during the rotation of said discs whereby said tape is acted upon by the contacting portions of the peripheral edges to cause a symbol, characteristic of the contacting portions of the peripheral edges, to be traced on said tape.

2,099,772

PELORUS

Victor Seidelhuber, Seattle, Wash., assignor of one-half to Frank V. Seidelhuber, Seattle, Wash.

Application February 15, 1937, Serial No. 125,765
13 Claims. (Cl. 33—72)

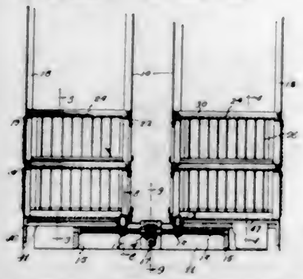
2. In a pelorus, in combination with the compass card and a pair of diametrically disposed sight vanes rotatable over said compass card, a pencil rotatable with the sight vanes, means normally holding the pencil above the compass card, out of marking position, and means to move the pencil at will into marking engagement with the compass card, in the line of sight, thus to indicate graphically the bearing of any selected sight.

2,099,773

PREPARATION OF TETRAALKYL THIURAM MONOSULPHIDES

Norman C. Somers, Carneys Point, N. J., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application May 2, 1933, Serial No. 668,983
3 Claims. (Cl. 260—123)



2. In the process of reacting sodium dimethyldithio-carbamate and cyanogen chloride in aqueous solution, the improvement which comprises carrying out the reaction in the presence of 0.05 to 1.5%, based on the weight of the product to be formed, of triethanolamine oleate.

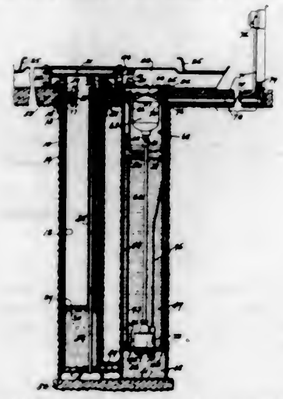
2,099,774

POULTRY OR LIVESTOCK VEHICLE BODY

Will M. Spencer, Estill Springs, Tenn.

Application May 1, 1935, Serial No. 19,307
3 Claims. (Cl. 119—12)

1. In a poultry or livestock vehicle body, a suitable base, body sections mounted thereon to move transversely of the base, each of said sections comprising an outer frame including pairs of uprights and superimposed spaced members connecting the uprights and constituting floor supports, inner frame members comprising pairs of uprights, floor supporting members connecting the pairs of last mentioned uprights, a removable floor for each section composed of the two pairs of uprights and their connecting members, removably applied members extending between the outer uprights and the inner uprights of each section, a barred frame removably applied to the space between the outer and inner frame sections and each two floor supporting members, and means attached thereto and engaging the members between the uprights for retaining the barred frames in place, means for closing the outer frame, and doors between the floor supports of the inner frame.



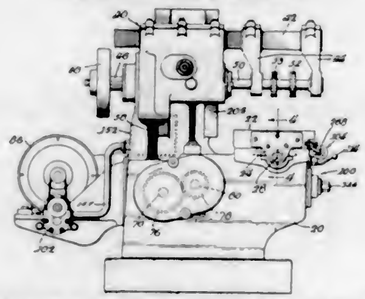
2,099,775

VEHICLE LIFT

Louis C. Stukenborg, Memphis, Tenn.

Application June 26, 1935, Serial No. 28,427
6 Claims. (Cl. 60—52)

1. In a lift, a jack and a rigidly connected reservoir and pumping unit; said jack comprising a vertically disposed cylinder, a plunger slidably mounted therein and projecting thereabove and a superstructure carried by said plunger; said unit comprising a vertically disposed tank closely adjacent said cylinder and rigidly secured thereto, said tank being of substantially equal height with said cylinder and being divided transversely into a lower chamber of restricted height and a relatively much larger reservoir thereabove, passageways respectively connecting said chamber with the lower end of said cylinder and the upper end of said cylinder with said reservoir, means within said tank operable to transfer liquid from said reservoir through said chamber to said cylinder and means for establishing return flow from said cylinder and chamber to said reservoir, a stuffing box at the upper end of said cylinder, two sets of packing in said stuffing box, means spacing said packings apart, said means being perforated to permit flow from the interior to the exterior



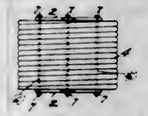
thereof, and said passageway connecting said cylinder and reservoir being in communication with the openings through said spacing means, plunger guiding means within said cylinder spaced below said stuffing box, said plunger being hollow from its lower end upward a distance at least equal to the distance from the bottom of said guiding means to a point midway between said packing means, and said piston having openings adjacent the upper end of said hollow portion through its circumferential wall.

2,099,776

MATERIAL WORKING APPARATUS

Ernest J. Svenson, Rockford, Ill.

Application November 7, 1930, Serial No. 494,045
Renewed September 23, 1937
39 Claims. (Cl. 90—21.5)



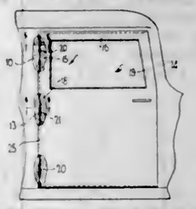
1. In material working apparatus, a frame, a spindle rotatable within said frame, driving means for imparting rotation to said spindle, a fluid operated actuator, a variable displacement pump driven in timed relation with said spindle for delivering fluid at relatively high pressure to said actuator, a power driven rapid traverse pump for delivering fluid at low pressure to said actuator, and a valve shiftable in response to the action of fluid from at least one of said pumps for controlling the direction in which the fluid from the variable displacement pump propels said actuator.

2,099,777

BUFFING WHEEL

Wayne S. Thomas, Detroit, Mich.

Application July 20, 1937, Serial No. 154,651
8 Claims. (Cl. 51—193)



8. A buffing wheel comprising a helically wound fabric; a helically wound member adapted to support and space the convolutions of the helically wound fabric; and a plurality of aligned supporting elements engaging the convolutions of the helically wound member, whereby it is secured against deformation; and means for coupling the supporting elments to a spindle.

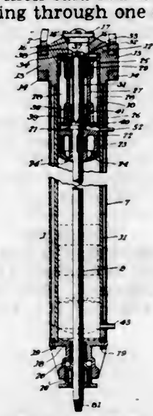
2,099,778

HINGED STRUCTURE

Ralph Clayton Todd, Elyria, Ohio

Application August 5, 1936, Serial No. 94,427
5 Claims. (Cl. 296—44)

1. The combination with a longitudinally outwardly curved support and a generally similarly curved support element, of hinges interconnecting the support and element at longitudinally spaced points, each of said hinges being of double pintle construction with parallel axes, one of said hinges being disposed adjacent an end portion of the supported element with one pintle axis adjacent the inner face of the element and the other pintle axis adjacent the outer face of the support, a second hinge disposed in the zone of maximum curvature of the element, the distance between the pintle axes of the second hinge being less than said distance for the first hinge, the distance between the axis of the pintle of the first hinge secured to the element and the axis of the pintle of the second hinge secured to the element being less than the distance between axes of the first hinge pintles but greater than one-half such distance, and the other pintle of the second hinge being secured to the support so that its axis falls on the perpendicular bisector of a line joining the position of the second hinge pintle secured to the element with the element parallel to the support and the position of said pintle after the element is revolved through 90°.



2,099,779

SUSPENSION HYDRAULIC SWIVEL AND FEED FOR ROTARY WELL DRILLING

Guglielmo R. Tremolada, Los Angeles, Calif.

Application May 22, 1936, Serial No. 81,167
3 Claims. (Cl. 255—19)

1. In a rotary well-drilling apparatus, a cylinder suspended from the traveling block of said apparatus, a piston rotatably mounted in said cylinder, a guide mounted in said cylinder, a piston rod extending through said piston and said guide, and secured in said piston, a roller bearing in said guide in which said rod is journaled, said piston rod extending through one end of said cylinder, means for introducing fluid into said cylinder below said piston or allowing said fluid to escape from said cylinder, and means for connecting the drill string to said piston rod.

2,099,780

APPARATUS FOR WEAVING TERRY FABRIC

Marc Van de Casteele, Roubaix, France

Application May 10, 1935, Serial No. 20,866
In France May 12, 1934
6 Claims. (Cl. 139—26)

1. In combination with a loom for weaving looped fabrics, particularly terry fabrics, means for continuously supplying loop warps, means for taking up the fabric woven in the loom, means controlled by said take-up means for determining the maximum length of feed of the loop warps, means for applying tension to said loop warps and means controlled from said tension-applying means for varying the stroke of the loom lay.

2,099,781

HALOGENATION PROCESS AND PRODUCT

William Robert Waldron, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application October 27, 1933, Serial No. 695,547
2 Claims. (Cl. 23—205)

2. A composition adapted to react with hydroxy compounds to produce phosphorus oxy-chloride and compounds in which the hydroxyl group is replaced by a chlorine atom, said composition comprising substantially phosphorus pentachloride, phosphorus trichloride and ortho-dichlorobenzene.

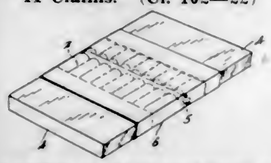
2,099,782

TEXTILE PRINTING PROCESS AND PRINTING PASTE THEREFOR

Ernst Weiss, Wattwil, Switzerland, assignor to Heberlein Patent Corporation, New York, N. Y., a corporation of New York

No Drawing. Application July 9, 1935, Serial No. 30,519. In Germany and Great Britain July 26, 1934
4 Claims. (Cl. 8—20)

1. A process for printing cellulosic fabrics or the like which comprises combining calcium thio-



cyanate, water and a thickener consisting of reprecipitated cellulose which would ordinarily act on one another to produce a jelly at room temperature and also combining therewith a sufficient quantity of formaldehyde to oppose such jellying action to produce a paste for printing on cellulose fabrics and printing such paste on a cellulose fabric at room temperature.

4. A printing-paste containing calcium thiocyanate, water and viscose waste which would ordinarily act on one another to produce a jelly at room temperature and formaldehyde to prevent jellying of paste at such temperature.

2,099,783
BOXED ROW FIRECRACKER PACKAGE

Robert Banning Whiteside, Los Angeles, Calif.

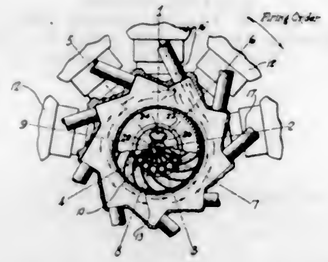
Application August 8, 1936, Serial No. 94,949
11 Claims. (Cl. 102—22)

1. A firecracker package consisting of a pair of open-mouth boxes, a flat row of parallel crackers packed in each box and these being of less depth than the length of the crackers, the rows being arranged in opposed coplanar relation with their projecting ends in contiguity, and disruptive binding means girdling the boxed rows and holding them against displacement; the individual crackers being unattached in any manner to other elements of the package.

2,099,784
COMBINED ADJUSTABLE STRAIGHT-EDGE, RULE, AND ALIGNMENT TESTER

Daniel H. Wieslander, Portland, Maine

Application July 2, 1936, Serial No. 88,565
8 Claims. (Cl. 164—73)

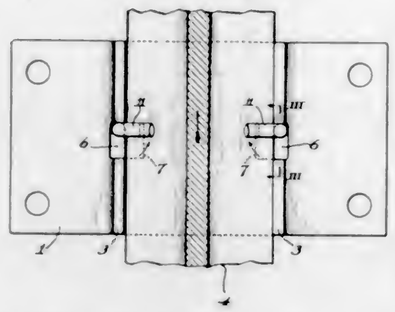


1. An adjustable straight-edge and rule comprising in combination a wooden body element having on one of its faces a slot extending the full length thereof, a metal channel-shape member disposed over one edge of said wooden body element and fixedly secured thereto, a second metal channel member, having one side wall constituting a cutting edge, disposed over but spaced from the opposite edge of said wooden body member, a short shim disposed between said cutting edge and the adjacent edge of said wooden body element, and means to flex, transversely of the straight-edge, the portions of said second metal channel member disposed, longitudinally, on either side of said shim.

2,099,785
ENGINE INTAKE SYSTEM

Andrew V. D. Willgoos, West Hartford, Conn., assignor, by mesne assignments, to United Aircraft Corporation, a corporation of Delaware

Application October 27, 1934, Serial No. 750,349
3 Claims. (Cl. 123—119)

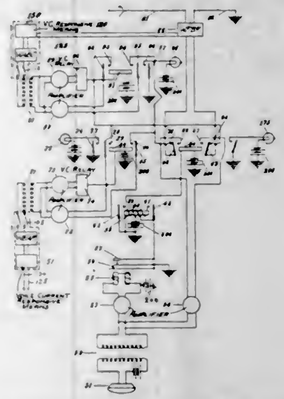


1. In an engine having cylinders arranged around a crank shaft and adapted to be fired in a predetermined rotational order and direction, means for conducting fluid portions from an annular chamber to said cylinders in the same rotational order, and direction, to charge said cylinders and means for rotating the fluid in said chamber in the opposite rotational direction.

2,099,786
RAIL-RETAINING DEVICE

Robert T. Woodings, Oakmont, Pa., assignor to Woodings-Verona Tool Works, Verona, Pa., a corporation of Pennsylvania

Application October 2, 1936, Serial No. 103,744
1 Claim. (Cl. 238—351)

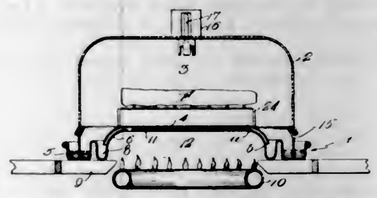


A rail-retaining device comprising a tie plate having a rib extending longitudinally of one edge of the rail base and constituting a shoulder for holding the rail against lateral movement in that direction, said rib and tie plate being provided with a substantially vertical slot therethrough extending longitudinally of the rib, the bottom of the tie plate having a recess opening into the side of said slot and extending inwardly beneath the rail, and a substantially U-shape clip formed from a rod and extending through said slot with its upper arm engaging the top of the rail base and its lower arm disposed in said tie plate recess in engagement with the upper wall thereof, said arms being sprung away from each other by the rail base and tie plate whereby the rail and tie plate are resiliently clamped together, and said lower arm being disposed against an end wall of said recess to prevent the clip from being further turned in that direction, said clip being capable of insertion through said slot only when its arms extend substantially longitudinally of the slot, and the rail and tie plate engaging surfaces of said arms being flattened.

2,099,787
RADIO BROADCASTING SYSTEM

Joseph L. Wright, Forest Hills, Long Island, N. Y.; Ellen Hamilton Clegg Wright, executrix of said Joseph L. Wright, deceased, assignor, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware

Application December 18, 1933, Serial No. 702,880
Renewed September 10, 1937
6 Claims. (Cl. 250—6)

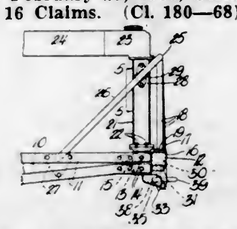


1. In a broadcasting system, a first station and a second distantly located station each having transmitting means adapted to broadcast its respective program, switching means at the first station controlled by said second station whereby the program of said second station may be broadcast over the transmitting means at said first station, said switching means comprising a voice current responsive device, and relay means controlled thereby for connecting said transmitting means at said first station to broadcast the program of said second station.

2,099,788
COOKING APPARATUS

Butler Ames, Boston, Mass.

Application July 10, 1935, Serial No. 30,667
5 Claims. (Cl. 53—5)

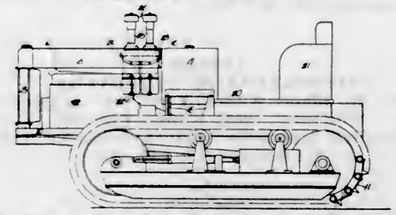


1. Cooking apparatus comprising a base member having a central opening and a continuous peripheral trough for holding a liquid, said trough being adapted to surround a source of heat, a dome-like closure having its rim disposed in said trough and defining an enclosure for the reception of the food to be cooked, means supported by said base member at points intermediate said opening and trough for supporting said food at a level above said opening, and a deflector plate disposed on one side of said opening and in spaced relation to the marginal portions surrounding said opening, thereby to provide a vent for said chamber leading to the vicinity of said source of heat.

2,099,789
FRONT END CONSTRUCTION FOR TRACTORS

David B. Baker, Riverside, Clifford R. Rogers, Oak Park, and Norman O. Panzegrau, Chicago, Ill., assignors to International Harvester Company, a corporation of New Jersey

Application February 24, 1936, Serial No. 65,385
16 Claims. (Cl. 180—68)



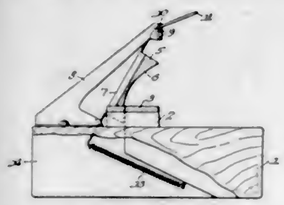
1. A front end construction for tractors comprising a pair of longitudinal main frame, spaced apart, side members, a transverse bolster connecting the front ends of said members, a radiator carried on the bolster, said bolster having a horizontal surface projecting forwardly of the radiator, a guard for the radiator mounted on said surface, the guard including a top piece the ends of which extend rearwardly and downwardly past the sides of the radiator near its upper end, said ends being connected to anchor brackets respectively secured to the main frame side members, and blocks mounted on each side of the radiator in which a portion of said ends is carried and to which they are respectively secured.

2,099,790
MOUNTING OF AUXILIARIES FOR TRACTOR ENGINES

David B. Baker, Riverside, Clifford R. Rogers, Oak Park, and Norman O. Panzegrau, Chicago, Ill., assignors to International Harvester Company, a corporation of New Jersey

Application May 16, 1936, Serial No. 80,054
20 Claims. (Cl. 180—54)

1. A mounting for air cleaners or the like for an engine having a longitudinal hood thereover, the mounting comprising a hollow bracket carried in the hood, and at least a pair of air cleaners supported side by side in said bracket, said cleaners having individual air inlet pipes and a common clean air outlet pipe leading from the bracket.



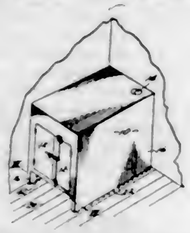
2,099,791
BLADE SHARPENING DEVICE

Guillaume Barsch, Paris, France, assignor to Industrie A. G. Allegro, Emmenbrucke, Switzerland

Application February 8, 1936, Serial No. 63,017
In Germany February 11, 1935
3 Claims. (Cl. 51—214)

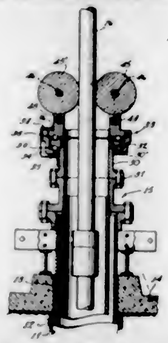
1. A blade sharpening device comprising an element having a flat grinding surface, an element having a curved grinding surface, said

curved surface element being pivotally mounted for bodily swinging movement longitudinally of the grinding surface of said other element, and



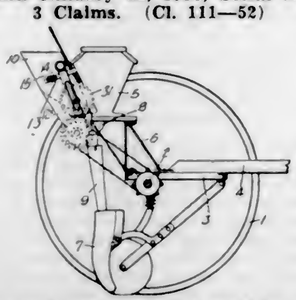
means to tend said curve-surfaced element to a predetermined position with respect to said flat-surfaced element.

2,099,792
ELECTRIC SOLDERING IRON
Charles Thomas Beadling, Canonsburg, Pa.
Application January 13, 1937, Serial No. 120,446
1 Claim. (Cl. 219—26)



An electric soldering iron comprising a handle, a perforated tube having one end mounted in one end of the handle, a tubular container having internal and external threads at one end thereof and the outer end of the perforated tube being internally threaded to receive the external threads of said container, a plug in said end of the container and engaging the internal threads, a tip threaded to the outer end of the container, an electric heating element in the container, leads connected with the element and passing through the plug, conductors connected with the leads and passing through the perforated tube and the handle and heat insulating material in the perforated tube.

2,099,793
REFRIGERATOR STRUCTURE
Henry W. Blake, Kansas City, Mo., assignor to William F. Kirk, Kansas City, Mo.
Application September 23, 1935, Serial No. 41,729
2 Claims. (Cl. 220—18)



1. In a refrigerator of the character described and for the purpose specified, a case having a floor; depending walls along two opposed sides of said case extending below the floor whereby to permit positioning a truck thereunder when the case is resting upon said walls; and a plurality of spur assemblies on the lower edge of each wall respectively for precluding accidental movement of the refrigerator along the supporting surface, each comprising a yoke set into the wall, a spur element in screwthreaded engagement with the yoke, and a lock member confined within the yoke, adjustable to and from a position securing the spur element against movement, said yoke forming an opening extending transversely entirely through the said wall.

2,099,794
ORIENTING DEVICE FOR WELL TOOLS
Lynn F. Bonney, Los Angeles, and Robert B. Moran, La Canada, Calif.
Application August 3, 1936, Serial No. 94,036
12 Claims. (Cl. 255—1)

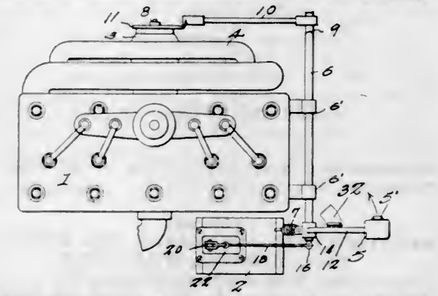
1. For use in orienting a drill pipe in a bore hole; a tubular head piece; means supporting said head piece near the mouth of the bore hole in substantially concentric relation therewith; a ring member mounted on said head piece for free rotation relative thereto; and drill pipe engaging means mounted on said ring member and adapted to frictionally engage a drill pipe passing therethrough, thereby interlocking said drill pipe and said ring member aganist relative rotation, said pipe engaging means being designed to permit the axial movement of said drill pipe through said ring member.

2,099,795
FERTILIZER SOWING ATTACHMENT FOR SEEDING MACHINES
Allan Moyer Buehler, Preston, Ontario, Canada, assignor to Eastern Steel Products Limited, Preston, Ontario, Canada, a company of Canada
Application January 31, 1936, Serial No. 61,786
3 Claims. (Cl. 111—52)

1. The combination with a seed hopper of a seed drill, of a fertilizer feed hopper, a bolt extending through the wall of the seed hopper into the fertilizer hopper at each end, a lug extending from the fertilizer feed hopper below each bolt against the wall of the seed hopper, and a longitudinally adjustable member secured to the fertilizer feed hopper above each bolt so as to bear at one end against the wall of the seed hopper.

2,099,796
CULTIVATOR SHOVEL
Harry Chibnik, Sioux Falls, S. Dak.
Application July 11, 1936, Serial No. 90,176
16 Claims. (Cl. 97—203)

1. In combination, a cultivator blade having an axially disposed reinforcing rib on its rear face; a mounting adapted to be secured to a cultivator and having an axially disposed groove in its front face receiving the rib; studs extending from the blade, opposite the groove; said groove having perforations therein for the reception of the studs, means on the studs for locking the plates together; and members on the studs of greater width than the perforations and of length equal to the depth of the groove.



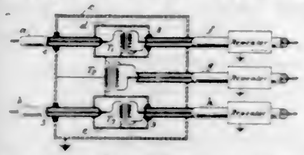
2,099,797
ELECTROLYTIC CONDENSER UNIT
Richard U. Clark, Fort Wayne, Ind., assignor to The Magnavox Company, Fort Wayne, Ind., a corporation of Arizona
Application March 19, 1935, Serial No. 11,768
33 Claims. (Cl. 175—315)

1. An electrolytic condenser comprising a common filmed electrode, two other unfilmed electrodes disposed in spaced relation, one adjacent each end and in overlapping relation with said common filmed electrode, said electrodes being wound spirally in a single assembly to provide a plurality of capacitances, a continuous electrolyte disposed between said filmed and unfilmed electrodes, and an insulated area upon said common filmed electrode located opposite the space between the ends of said two unfilmed electrodes for limiting the electrolytic path between said electrodes to the overlapping areas thereof.

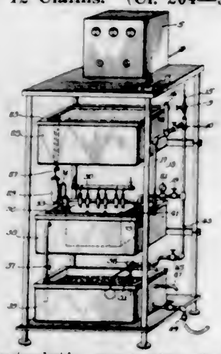
2,099,798
PEDAL MECHANISM
Douglas Collins, Salisbury, N. C.
Application September 13, 1933, Serial No. 689,317
6 Claims. (Cl. 123—179)

1. In combination with a throttle and starting motor for an internal combustion engine, a rock shaft, a pedal having a lever mounted to rock the shaft, a shank on the lever having a pivotal bearing on the rock shaft, operative connections between the shaft and throttle, and operative connections between the lever-shank and the starting motor.

2,099,799
CELLAR PIPE
John T. Corley, Providence, R. I.
Application July 19, 1934, Serial No. 735,957
6 Claims. (Cl. 299—73)



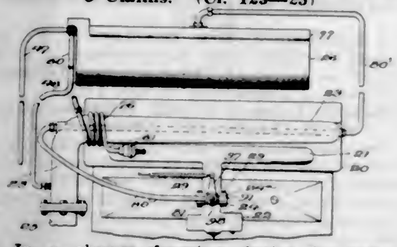
1. In a cellar pipe, a base, a nozzle carrier rotatably mounted therein, a nozzle swivelly mounted in said nozzle carrier and rotatable about an axis at right angles to the axis of rotation of the nozzle carrier, means for rotating said nozzle carrier and for swivelling said nozzle independently of the rotation thereof, and means for nullifying the reactive effect of fluid emerging from said nozzle, said latter means including a second nozzle secured to and oppositely directed to said first nozzle.



2,099,800
SHIELDED CIRCUITS FOR OPEN WIRE LINES
Lloyd Espenschied, Kew Gardens, N. Y., and Harold Everdell Curtis, East Orange, N. J., assignors to American Telephone and Telegraph Company, a corporation of New York
Application February 4, 1936, Serial No. 62,354
14 Claims. (Cl. 179—15)

1. In a transmission system, two coaxial conductor pairs, each serving as a separate physical transmission circuit, the outer conductors being insulated from the ground, a third transmission circuit comprising the outer conductors of the two coaxial conductor pairs, means for separating messages over the three circuits from each other, said means including a transformer for each co-

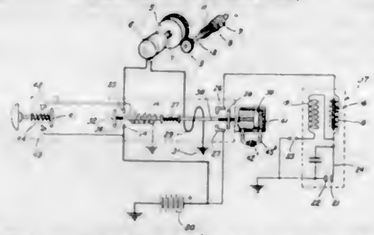
axial pair, means for connecting each outer conductor through a winding, and a secondary winding associated with said winding for picking up messages from the third circuit.



2,099,801
ELECTROLYTIC APPARATUS FOR PREPARING CHEMICAL SOLUTIONS
Roy Blair Everson, Chicago, Ill.
Application October 11, 1934, Serial No. 747,816
12 Claims. (Cl. 204—59)

1. An electrolytic apparatus for preparing a chemical solution comprising in combination a raw electrolyte preparation tank, means for conveying electrolyte prepared therein to an electrolytic cell, said electrolytic cell being disposed within a second tank in such a manner as to be surrounded by an appreciable quantity of water continuously being supplied to said second named tank, means attached to said electrolytic unit adapted to convey off the products of electrolysis, said means being also adapted to convey said products of electrolysis into the water of said second named tank, means for drawing solution from said second named tank and conveying it to a third tank, said third named tank being continuously supplied with water up to a constant level for the purpose of further diluting the solution drawn off from the second named tank.

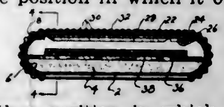
2,099,802
FUEL RECLAIMING DEVICE
Herbert O. Ewing, Middleport, Ohio
Application March 17, 1936, Serial No. 69,374
5 Claims. (Cl. 123—25)



1. In a charge forming device for internal combustion engines, means for diverting a portion of the engine's exhaust gas, means for mixing air with the diverted exhaust gas, means for supplying moisture to the diverted exhaust gas, means for removing excess moisture from the diverted exhaust gas, means for heating the diverted exhaust gas subsequent to supplying the moisture, and means for mixing the diverted exhaust gas with a fresh fuel charge in proper proportions to produce an explosive charge, the explosive charge being directed into the engine intake manifold.

2,099,803
METHOD FOR MAKING GAUGES
Thomas M. Eynon, Philadelphia, Pa.
Application March 5, 1937, Serial No. 129,123
2 Claims. (Cl. 29—163.5)

2. The method of making a gauge which consists in cutting a piece of tubing at predetermined points to produce partly detached bands of predetermined widths and bending one edge of each of said bands against the opposite wall of said tubing to form pockets all facing in the same direction adapted to receive and retain the liquid.

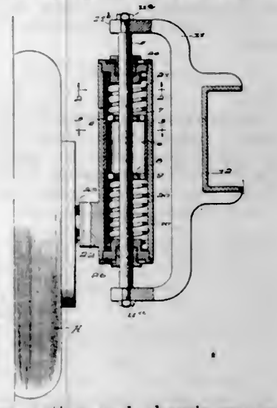


2,099,804
ENGINE STARTING MECHANISM
Martin J. Finnegan, New York, N. Y., assignor to Eclipse Aviation Corporation, East Orange, N. J., a corporation of New Jersey
Application May 11, 1936, Serial No. 79,202
7 Claims. (Cl. 290—38)

3. The combination with an inertia starting mechanism and ignition current supply means including a source of current for supplying ignition current to the engine, an electric motor for energizing said inertia starting mechanism, an electromagnet controlling operation of said ignition current supply means, and means for causing current to flow from said source to said motor and electromagnet in sequence.

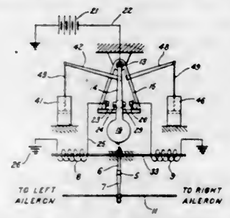
2,099,805
CONTAINER
Irving Florman, New York, N. Y.
Original application November 16, 1934, Serial No. 753,396. Divided and this application January 18, 1935, Serial No. 2,442
4 Claims. (Cl. 206—37)

1. A container comprising a bottom wall, side walls, and end walls, said container having an opening in its top, a cover hinged along one edge of said opening fitting within and substantially closing the opening, spring means normally urging said cover to swing to open position, a unitary flexible closure member of greater length than the length of said cover, and endless means on said container for guiding said closure member to slide from one position in which it overlies said



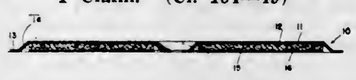
cover to another position in which said cover is free for movement to open position and for guiding said closure member for continuous and reciprocatory movement along its entire outer edges.

2,099,806
METHOD OF FORMING A POPGUN BARREL
John Gora, Wyandotte, Mich., assignor to All Metal Products Company, Wyandotte, Mich., a corporation of Michigan
Application August 14, 1935, Serial No. 36,077
4 Claims. (Cl. 113—116)



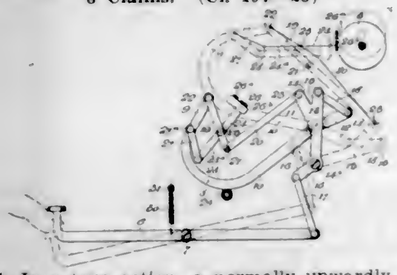
1. A method of forming a popgun barrel consisting in stamping a blank with parallel edges from a sheet of metal, beveling the parallel edges through a minor portion of their length, rolling the parallel edges inwardly to the center of the sheet and forming a raised rib in the center of the sheet, forming a shoulder on each side of the raised rib and seating the beveled edges of the barrel tightly on said shoulders to form compression chambers and shaping one end of the blank to provide parallel guide channels extending in spaced parallel relation on the underside of the formed barrels.

2,099,807
KNEE ACTION AND CHASSIS SUSPENSION FOR AUTOMOBILES
Warren B. Gregory, Hurtsboro, Ala.
Application June 17, 1936, Serial No. 85,803
6 Claims. (Cl. 280—96.2)



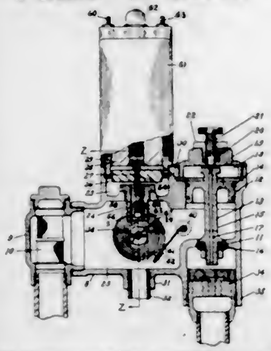
1. In knee action and chassis suspension for automobiles, a bracket adapted to be attached to the chassis of an automobile including a vertically disposed rod carried thereby, a cylinder mounted on said rod for vertical reciprocation and rotation, a piston on said rod on which the cylinder reciprocates and rotates, heads in the ends of the cylinder through which the rod projects, means between one head of the cylinder and the piston for yieldingly supporting the said cylinder, means between the other head of the cylinder and the said piston for checking the rebound of the chassis, steering mechanism associated with the cylinder, and a wheel mounting rigidly attached to the cylinder.

2,099,808
AIRCRAFT
Clinton H. Havill, South Orange, N. J., assignor to Eclipse Aviation Corporation, East Orange, N. J., a corporation of New Jersey
Application January 7, 1936, Serial No. 57,979
3 Claims. (Cl. 244—77)



1. In an aircraft of the type in which ailerons are employed as the means of controlling the position of the transverse axis of the craft, the combination with said ailerons of electromagnetic actuating means therefor, a switch controlling energization of said electromagnetic means, means including inter-engaging pendulous bodies for operating said switch in response to a departure of the craft from its normal flying attitude, and separately regulable dashpot means individual to each of said pendulous means to damp the movements thereof.

2,099,809
FLOOR COVERING
Gerald G. Hunter, Harry M. Pryale, and Samuel C. Clark, Pontiac, Mich., assignors to Baldwin Rubber Company, Pontiac, Mich., a corporation of Michigan
Application November 11, 1935, Serial No. 49,312
1 Claim. (Cl. 154—49)

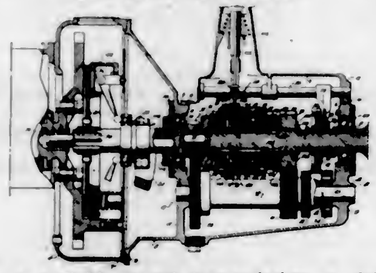


A floor mat having a layer of fibrous material of predetermined area, an elastic base layer including rubber secured to and coextensive with one face of the layer of fibrous material, said base layer constituting the floor engaging surface, and a preformed cover of wear-resisting material of uniform thickness and of greater area than the layer of fibrous material secured to the other face of the layer of fibrous material and having marginal portions free of the fibrous material and base layer extending downwardly beyond the upper edges of the layer of fibrous material for surface engagement with the floor at points substantially in a horizontal plane with but spaced from the lower edges of the base layer.

2,099,810
TYPEWRITING MACHINE
Seyed Khalil, New York, N. Y., assignor to Royal Typewriter Company, Inc., New York, N. Y., a corporation of New York
Application April 6, 1936, Serial No. 73,023
8 Claims. (Cl. 197—25)

1. In a type action, a normally upwardly extending type bar, a key lever, and connections between the type bar and the key lever for raising and moving the type bar rearwardly into a horizontal printing position, said connections including a supporting lever, an intermediate lever, and a toggle connecting the supporting lever and the intermediate lever and having pivotal connection with the type bar.

2,099,811
FLUID-THERMO-VALVE
Joseph Marion King, Detroit, Mich.
Application September 2, 1931, Serial No. 560,856
2 Claims. (Cl. 236—84)

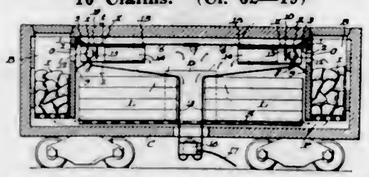


1. A fluid thermo-valve comprising a unit body having an inlet, an outlet, and an outlet valve, the said unit body having therein an occluded housing having therein an electric switch, the said unit body having therein a magnet adapted to cause operation of said outlet valve, the said switch and magnet being in series in an electric circuit, the said unit body having therein a thermostatic element mechanically connected to operate said switch.

2,099,812
MANUFACTURE OF SHAPED PRODUCTS IMPERMEABLE TO MOISTURE
Walter König, Wiesbaden, Germany, assignor to Rudolph Koepp & Co. Chemische Fabrik A. G., Oestrich in Rheingau, Germany, a German company
No Drawing. Application September 8, 1936, Serial No. 99,849. In Germany September 30, 1935
1 Claim. (Cl. 91—68)

A process for the manufacture of shaped products impermeable to moisture from cellulose formate and derivatives of cellulose formate, which consists in coating the shaped products with a varnish, which contains water-repelling substances and formic acid.

2,099,813
DRIVING MECHANISM
Raymond P. Lansing, Montclair, N. J.
Application April 28, 1931, Serial No. 533,564
1 Claim. (Cl. 74—370)

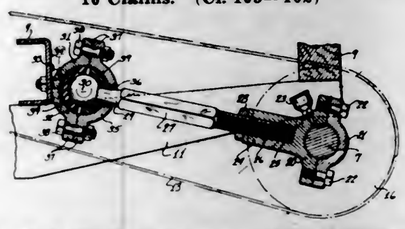


In a variable speed transmission, a driving shaft, a driven shaft, means including a set of interengaging friction plates for connecting the shafts in a high speed ratio, means for connecting the shafts in a lower speed ratio, said connecting means being selective, manually operable means for disconnecting the friction plates from the driving shaft, slidable means operatively connected to the driven shaft, and associated with the manually operable means, to connect the shafts through the lower speed ratio and means including a torque responsive screw for controlling the engaging pressure acting upon said friction plates.

2,099,814
PREPARATION OF ISOPROPYL SULPHATES
Arthur Whitney Larchar, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 7, 1933, Serial No. 701,337
6 Claims. (Cl. 260—99.12)

1. Process for the preparation of a mixture comprising monoisopropyl sulphate with a small amount of diisopropyl sulphate comprising contacting, with agitation propylene in the liquid state at 0–30° C. with sulphuric acid at 87.5–93% concentration.

2,099,815
PRECOOLING APPARATUS
James R. Lewis, Sidney Perkins, and Fitz J. Lewis, Hammond, La., assignors, by mesne assignments, to Vance M. Thompson, McCrory, Ark.
Application May 9, 1936, Serial No. 78,914
10 Claims. (Cl. 62—19)

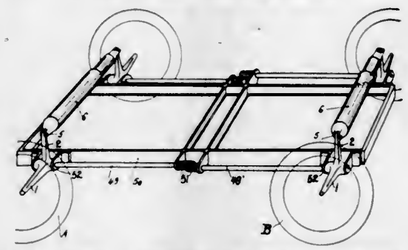


3. Pre-cooling apparatus including support engaging couplings, having depending portions, a track element having ends for engagement with said portions, said element including tension means for maintaining the ends thereof in engagement with the depending portions while said element is under tension but for releasing said ends for gravitation from said portions when tension is relieved, and air forcing means detachably carried by and movable along said element, said means including a tube, a blower therein, means for directing air into one end of the tube, and a distributing duct leading from the other end thereof.

2,099,816
BRAKE FOR TRAILERS
Alexus C. Lindgren, Chicago, Ill., assignor to International Harvester Company, a corporation of New Jersey
Application February 29, 1936, Serial No. 66,347
6 Claims. (Cl. 188—142)

1. A combination draft hitch and brake applying device for trailing vehicles comprising in combination with the vehicle, a draft structure connected to the vehicle and extending forwardly therefrom, a draft member telescopically mounted with respect to said draft structure, a brake operating member pivoted on a transverse axis on the draft structure, a brake operating element connected to said member and to the brakes of the vehicle, a link pivoted to said member and to the draft member, a retaining member pivoted to the brake operating member at a point spaced from its pivot point on the draft structure, a bracket mounted on the draft structure provided with an opening through which the retaining member slidably extends, and a compression spring abutting the bracket and a stop on the retaining member whereby pressure exerted by the spring maintains the draft element in extended position until a predetermined over-run pressure as controlled by the spring pressure is exerted in a forward direction.

2,099,817
VEHICLE BEARING
Charles G. Mahana, Three Rivers, Mich., assignor to Fairbanks, Morse & Company, Chicago, Ill., a corporation of Illinois
Application April 14, 1934, Serial No. 720,537
10 Claims. (Cl. 105—102)

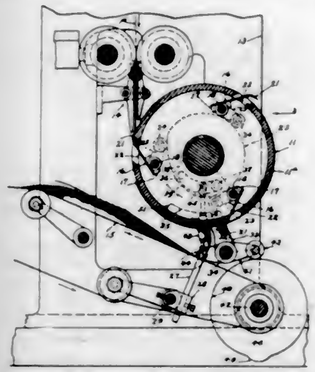


2. In a railway motor car, a flexible power transmission element, a drive axle, a driven element carried by the axle, means for adjusting the tension of the transmission element, an axle-steadying bearing on the axle near the driven element, an arm projecting forwardly of the axle and connected to said bearing near the rear end of the arm, a pivoted joint at the forward end of the arm, means, including said joint, for anchoring the forward end of the arm to a portion of the car frame, and means for adjusting the effective length of the arm without affecting the adjustment of said transmission element.

2,099,818
STATIC LIMITING DEVICE
David G. McCaa, Lancaster, Pa., assignor to Alan N. Mann, Scarsdale, N. Y., as trustee
Application December 2, 1935, Serial No. 52,523
10 Claims. (Cl. 250—20)

1. In a static limiting system, a thermionic tube having a grid, an input circuit including said grid and an output circuit; a resistance connected to said output circuit; means for limiting the maximum current in said output circuit to a sharply defined and substantially constant value in spite of increasing positive voltages applied to said grid; a loading tube effectively connected across said resistance, and means biasing said loading tube so that said loading tube will become conductive as the voltage applied to said grid is made less positive whereby said loading tube will limit the minimum value of current in said output circuit to a substantially constant value in spite of increasing negative voltages applied to said grid.

2,099,819
VEHICLE SUSPENSION
Pierre Ernest Mercier, Paris, France
Application March 9, 1935, Serial No. 10,268
In France March 10, 1934
11 Claims. (Cl. 280—104)



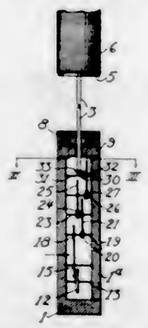
1. A vehicle comprising a chassis, wheels located on each longitudinal side of the chassis, means for suspending the chassis on the wheels, resilient reaction means capable of resilient reactions connected to said suspension means, and means comprising mechanical transmissions for interconnecting the resilient reaction means of a plurality of wheels located on the same side of the chassis, these mechanical transmissions comprising torsion rods coupled by gearing in order to interconnect the resilient reactions occurring on each side of said chassis.

2,099,820
DELIVERY MECHANISM FOR PRINTING MACHINES
Joseph E. Meyer, Jackson Heights, N. Y., assignor, by mesne assignments, to R. Hoe & Co., Inc., New York, N. Y., a corporation of New York
Application November 15, 1933, Serial No. 698,083
19 Claims. (Cl. 93—93)

1. In a delivery mechanism for a printing machine, a cylinder having grippers for handling cut

products, means for operating the grippers, a conveyor to receive the products, a stop located to strip the products from the cylinder and position

same on the conveyor when released by the grippers, a second stop, and means for opening the grippers prematurely as certain of said products are stripped by the second stop.



2,099,821

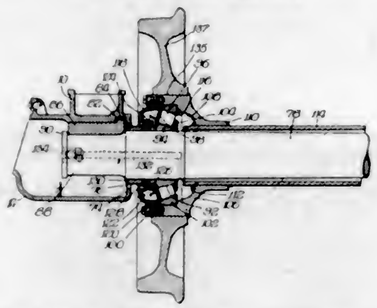
POWER CLOCK OF SMALL DIAMETER

Thomas V. Moore, La Porte, and Winfield C. Landry, Houston, Tex., assignors to Standard Oil Development Company, a corporation of Delaware

Application November 20, 1934, Serial No. 753,814

2 Claims. (Cl. 185—40)

1. A clock-work mechanism for use in deep well instruments including a housing carrying rotatably a driving shaft, a main spring in the housing secured to the shaft coiled in a plane perpendicular to the longitudinal axis of the housing, a train of gears and pinions of varying sizes and an escapement operatively connected with the shaft, the shafts of the train of gears and escapement being disposed perpendicularly to the longitudinal axis of the housing and in a plane of the longitudinal axis of the housing, a balance wheel, and a pallet fork operatively connected to the escapement and balance wheel, the balance wheel and fork being mounted for oscillation on shafts parallel with the gear shafts whereby the internal diameter of the housing can be of a size only sufficiently larger than the diameter of the largest gear to permit of rotation of the train of gears.



2,099,822

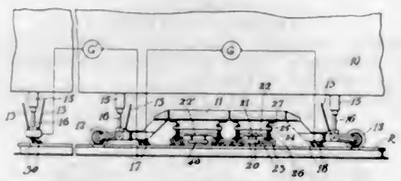
WHEEL AND AXLE ASSEMBLY

Alfred H. Oelkers, Chicago, Ill., assignor to American Steel Foundries, Chicago, Ill., a corporation of New Jersey

Application October 9, 1933, Serial No. 692,739

6 Claims. (Cl. 295—36)

4. An axle for a wheel and axle assembly, comprising a centrally disposed tubular member of substantially uniform wall thickness throughout its entire length, a bearing housing disposed at each end of said member, each of said housings having a hub fitting over an end of said member, said housings having a cupped portion disposed adjacent the hub thereof, the ends of said tubular member extending outwardly of the outer end of said hubs to provide lubricant reservoirs of said cupped portions, and a weld of greater diameter than said tubular member and disposed on the outer surface thereof at the outer end of said hubs for securing said housings to said member.



2,099,823

RAIL FLAW DETECTOR MECHANISM

Walter M. Perry, Brooklyn, N. Y., assignor to Sperry Products, Inc., Brooklyn, N. Y., a corporation of New York

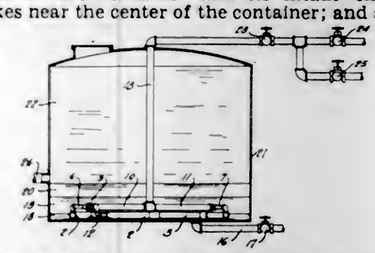
Application May 20, 1936, Serial No. 80,747

4 Claims. (Cl. 175—183)

1. In a rail flaw detector mechanism, means for energizing the rail with flux, means responsive to variations in flux, and a magnetic conductor positioned adjacent the rail and in advance of said responsive means.

2,099,824

APPARATUS FOR PURIFYING OIL



Charles R. Reeves and Cecil R. Gentry, Oklahoma City, Okla.

Application November 30, 1936, Serial No. 113,302

3 Claims. (Cl. 196—46)

1. An apparatus for treating oil comprising a cylindrical container having a closure; a plurality of injectors adjustably secured adjacent the container bottom, each being so positioned that its discharge end discharges along the side

wall of the container and its intake end intakes near the center of the container; and a plu-

rality of feeder pipes connecting the injectors to a controlled source of supply.

2,099,825

OIL BASE HYDRATABLE DRILLING FLUID

Ferdinand W. Rolshausen and Sam L. Bishkin, Houston, Tex., assignors to Standard Oil Development Company, a corporation of Delaware

No Drawing. Application April 19, 1935, Serial No. 17,272

6 Claims. (Cl. 255—1)

1. A drilling fluid, comprising an oil, a weighting material, and a water-insoluble soap.

2,099,826

INSECTICIDE

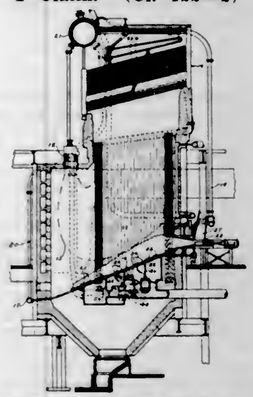
Paul S. Schaffer and Herbert L. J. Haller, Washington, D. C., dedicated to the free use of the People of the United States of America

No Drawing. Application July 22, 1937, Serial No. 155,024

2 Claims. (Cl. 167—33)

(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. An insecticide containing as its essential active ingredient a dialkylacridan.



2,099,827

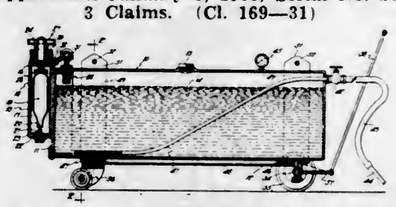
WET REFUSE BURNING GRATE

Louis J. Schrenk, Detroit, Mich.

Application May 25, 1935, Serial No. 23,433

1 Claim. (Cl. 122—2)

In a refuse burning boiler and furnace installation having a boiler, a combustion chamber, an inclined perforate hearth in said chamber, means for feeding refuse to the hearth and means for supplying air under pressure through the hearth and the bed of refuse thereon; a plurality of pivoted agitators interposed in the hearth and operable to advance the fuel therealong, said agitators each having fuel contacting surfaces including a plurality of plates disposed horizontally and arranged in overlapped relation with their adjacent ends spaced to form a plurality of air passages inclined relatively to the surface of said hearth for directing air flowing through said passages under pressure in such manner as to assist in moving the fuel along the hearth.



2,099,828

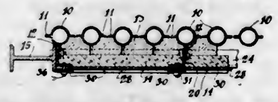
PORTABLE FIRE EXTINGUISHER

Jay Lawrence Seat, Fairfield, Conn.

Application January 3, 1935, Serial No. 200

3 Claims. (Cl. 169—31)

1. In a portable wheel type fire extinguisher, a horizontally disposed tank adapted to be mounted on a wheel chassis, a pressure cartridge compartment disposed beyond one end of said tank and having an opening in the top thereof for the insertion of a puncturable pressure cartridge thereinto, a discharge outlet at the other end of said tank, means within said cartridge compartment for slidably supporting a pressure cartridge in a vertical position, a piercing member extending upwardly from the bottom of said compartment, a communicating passage between the top of said tank and the top of said cartridge compartment, a screw plug threaded into the open top of said cartridge compartment, and manipulative means mounted in said screw plug and manually operable for slidably forcing a pressure cartridge into puncturing engagement with said piercing member whereby to release the pressure contents thereof for passage from said compartment to the top of said tank.

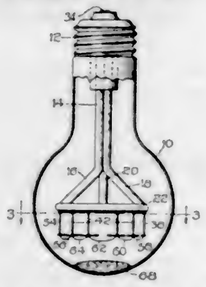


2,099,829

CASING WALL CONSTRUCTION FOR BOILERS

Alfred R. Smith, Forest Hills, N. Y., assignor to Combustion Engineering Company, Inc., New York, N. Y.

Application July 23, 1936, Serial No. 92,075



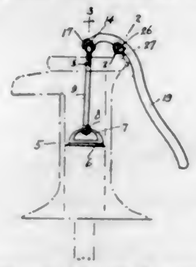
1 Claim. (Cl. 122—235)

In a boiler or the like having a wall including a row of fluid circulating tubes; a plurality of angle irons spaced at intervals along said wall with one leg of each angle iron disposed in a common plane parallel to the plane of the outer surface of said wall and the other leg of each angle iron extending toward one of said tubes; members attached to certain of said tubes located at intervals along said wall corresponding to the spacing of said angle irons and projecting outwardly therefrom toward the latter; means connecting the projecting members on said certain tubes to the inwardly extending legs of correspondingly positioned angle irons for supporting

the latter; a plurality of series of aligned angle irons spanning the intervals between said first mentioned angle irons and each disposed with one leg thereof flush with the coplanar legs of said first mentioned angle irons; panels covering the areas between and defined by contiguous portions of said angle irons; and means fastening said panels to said angle irons.

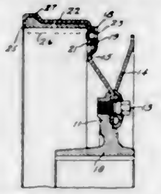
2,099,830
LAMP
Samuel Stahl, Chicago, Ill.
Application February 18, 1935, Serial No. 6,955
7 Claims. (Cl. 176—1)

1. In a metal vapor arc lamp, a bulb, a metal filling in said bulb, stationary terminals in said bulb for maintaining a plurality of arcs arranged in series, and shunt heating resistances for each arc, one of said heating resistances being of higher resistance than any of the rest.



2,099,831
CONNECTER FOR V-BELTS
Wellington P. Taber, West Warwick, R. I.
Application February 11, 1936, Serial No. 63,358
6 Claims. (Cl. 24—33)

6. A connecter for a belt of frustro-pyramidal cross-section comprising a clamp for each end of the belt having jaws engaging the top and bottom surfaces of the end portions of the belt and leaving the tapering surfaces free, each of said clamps having a slot and spaced resilient bearings with a constricted opening thereto, a connecting link in said slots provided with flat surfaces for engaging the opposite edges of the slot, said link being provided with spaced openings completely surrounded by stock, and pins in said link openings having a central larger portion providing shoulders, said shoulders engaging the edges of said slots to prevent axial movement thereof when in one position relative thereto, and said pins being of a size to snap through said constricted openings by reason of the resilience of said bearings to be detachably secured in said bearings.

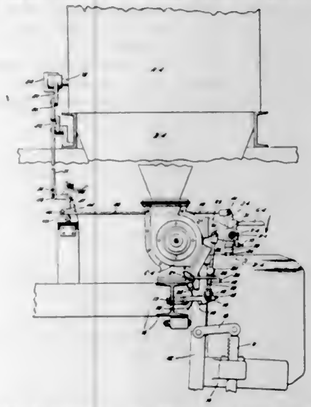


2,099,832
PUMP HANDLE STRUCTURE
Valley A. Thomas, Manila, Ark.
Application July 10, 1936, Serial No. 89,975
3 Claims. (Cl. 103—215)

1. In combination, a support, a hollow pump handle, a ball bearing including an outer race mounted in an opening formed in the underside of said pump handle intermediate its ends, said ball bearing further comprising an inner race and balls disposed between the inner and outer

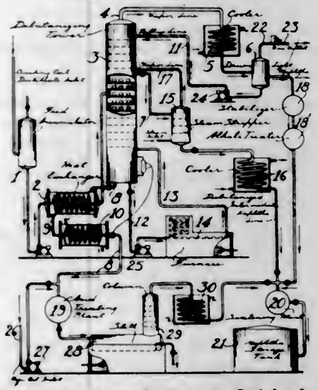
races, said bearing having a portion depending below said pump handle, a pivot on said support supportably traversing said inner race and mounting said pump handle on said support.

2,099,833
BRAKE DRUM CONSTRUCTION
Andrew S. Van Halteren, Akron, Ohio, assignor to Motor Wheel Corporation, Lansing, Mich., a corporation of Michigan
Application August 13, 1934, Serial No. 739,627
10 Claims. (Cl. 188—218)



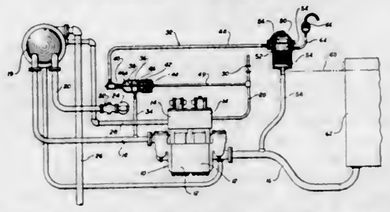
1. In a wheel construction, a rotatable hub member, a brake drum mounted on the hub member, said drum including a back portion and a ring portion, and an expansion member connected to the back portion and ring to join the two together, said expansion member having a higher coefficient of expansion than either the ring or back portion.

2,099,834
PACKAGE FILLING MACHINE
Arno Andreas, Munster, Germany, assignor to Bagpak, Inc., New York, N. Y., a corporation of Delaware
Application March 16, 1932, Serial No. 599,150
5 Claims. (Cl. 226—48)



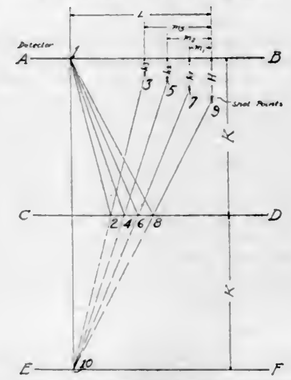
4. In a package filling machine, a plurality of units each including a receptacle for weighing and discharging materials, means to support and discharge a package, and means to guide weighed material from the receptacle to the package, means to prevent discharge of material from the receptacle irrespective of operation of the weighing mechanism, means for releasing said discharge preventing means, means engaging said releasing means for preventing operation of said releasing means until a predetermined amount of material has been weighed, and unitary means having an interconnection with said releasing means in one unit and an interconnection with the package supporting and discharging means in another unit for causing operation of both said package discharging means and said releasing

means, the interconnection between said unitary means and said releasing means providing for



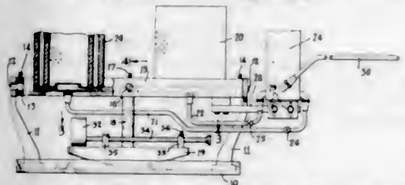
complete actuation of said package discharging means prior to actuation of said releasing means.

2,099,835
PROCESS OF PRODUCING GASOLINE FROM CRACKED NAPHTHA
Edwin H. Barlow, Hillside, Amiot P. Hewlett, Cranford, and Paul E. Kuhl, Elizabeth, N. J., assignors to Standard Oil Development Company, a corporation of Delaware
Application September 2, 1933, Serial No. 688,046
1 Claim. (Cl. 196—23)



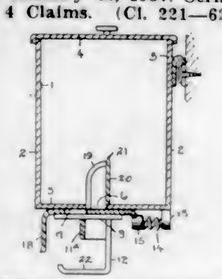
The method of producing a finished gasoline from a cracked naphtha having a sulfur content of at least 0.12 which comprises fractionating it to remove any gas and to obtain three liquid portions, namely, a light portion having a final boiling point (Engler) of about 270° F. greatly susceptible to sulfur reduction by alkali treatment, an intermediate portion having a final boiling point (Engler) of about 315° F. only slightly susceptible to sulfur reduction by alkali treatment and greatly susceptible to sulfur reduction by treatment with sulfuric acid but also susceptible to large losses by acid treatment, and a heavy portion greatly susceptible to sulfur reduction by acid treatment with only slight treating losses, separately stabilizing the light naphtha portion and treating it with alkali, separately treating the heavy naphtha portion with sulfuric acid and redistilling it to remove polymers, blending the treated light naphtha portion and the treated heavy naphtha portion with the untreated intermediate portion and doctor sweetening the blend to obtain a finished gasoline.

2,099,836
COMPOUND FEEDER
Philip D. Blanchard, Hammond, Ind., and Charles R. Hardy, Mount Vernon, N. Y., assignors to The Superheater Company, New York, N. Y.
Application October 26, 1933, Serial No. 695,258
5 Claims. (Cl. 210—29)



1. The combination of a boiler feed pump, a source of supply therefor, and a compound feeding means associated therewith, said feeding means having a chamber for containing compound lying above the maximum level of said source of supply, and a conduit connecting the high pressure side of said pump to the low pressure side thereof in which said chamber is included for circulating feed water through the latter to prepare a water treating solution.

2,099,837
SEISMIC REFLECTION METHOD
Ludwig W. Blau, Houston, Tex., assignor to Standard Oil Development Company, a corporation of Delaware
Application December 30, 1933, Serial No. 704,800
7 Claims. (Cl. 181—0.5)



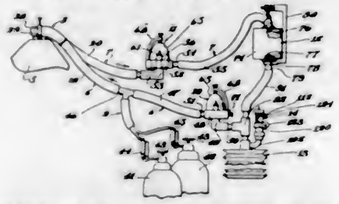
1. In geophysical prospecting, the steps which comprise creating a source of seismic waves at the surface of the earth, detecting the arrival of direct and reflected waves at spaced points along the surface of the earth substantially aligned with the source, and spacing the detectors vertically in the earth in positions determined by the horizontal distances between the detectors, by the distance from the shot-point, and by the depth and dip of the reflecting layer until they detect the arrival of the reflected waves from a given subsurface stratum simultaneously.

2,099,838
OIL BURNER MOUNTING FOR MARINE USE
Charles O. Carlson, Staten Island, N. Y.
Application June 12, 1936, Serial No. 84,823
5 Claims. (Cl. 126—24)

1. An oil burner and mounting therefor, for marine use, comprising a burner plate having burner means carried thereby and including a gimbal mounting for said burner plate cooperating with counterweight means below the burner plate to maintain the burner plate level upon pitching and rolling, said counterweight means including supplemental counterweight means associated with the aforesaid counterweight for initially bringing the burner plate to a level condition.

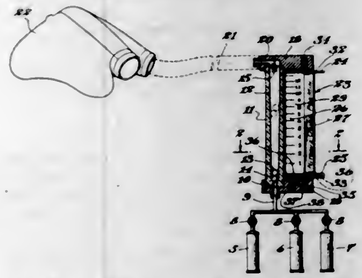
2,099,839
DISPENSING DEVICE
Phillip M. Chernoff, Middletown, Conn.
Application January 22, 1937, Serial No. 121,881
4 Claims. (Cl. 221—62)

1. A dispensing device comprising a container, a valve device for controlling delivery of the contents from the container, said container being provided with an outlet opening; said valve device having a frame formed with guide members and a guard arranged to register with the outlet opening, a slide member moving in the guides and having an opening designed to register with the outlet opening and a closure portion arranged to close said outlet opening, a spring member arranged between the frame and the slide member for normally holding the slide member in closing position, the guard member having an elongated side forming a guide, and bent at its free end to form a trough for catching excess or spilled material from the container.



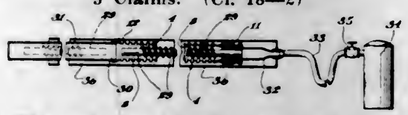
2,099,840
PUMP
Walter L. Church, Houston, Tex.
Application August 3, 1934, Serial No. 738,268
3 Claims. (Cl. 103—181)

1. In a pump, a working barrel, means for anchoring the barrel in a pump tubing, an upwardly opening standing valve controlling the flow of liquid through said barrel, a traveling barrel telescoping over the working barrel and in close frictional contact therewith, a nut threaded into the upper end of the working barrel and having an axial bearing and a vertical side groove which merges into said bearing, a traveling valve on the traveling barrel, a sucker rod connected to the traveling barrel for reciprocating the same, a valve body connected to the upper end of the traveling barrel, said body also forming impact means operable against said nut upon downward movement of the sucker rod to drive the working barrel downwardly, a rod attached to the body and working through said bearing, a



head on the lower end of said rod, a spline on the rod adjacent said head, said spline being engageable against the lower end of the nut when the rod is in one position, and being movable through said groove when the rod is in another position, said head and nut constituting impact means, upon upward movement of the rod, for driving the working barrel upwardly upon such upward movement.

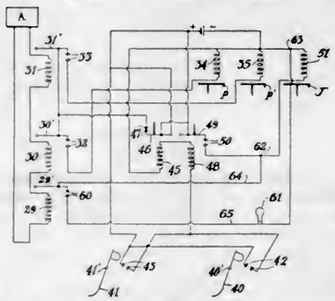
2,099,841
APPARATUS FOR THE ADMINISTRATION OF GASES
Karl Connell, Branch, N. Y.
Application September 5, 1936, Serial No. 99,588
19 Claims. (Cl. 128—191)



1. Apparatus for the administration of gases, comprising a breathing member, a plurality of conduits, an element adapted to connect said breathing member with said conduits and having a passageway therein which extends from said breathing member and which terminates in an interior opening and also having a resilient wall portion opposite said opening and movable toward the same, means providing a surface which will close said opening when said wall portion is moved inwardly, a flow-control means in one of said conduits for permitting gaseous flow away from said breathing member and preventing flow toward said breathing member, gas-absorption means at the end of said conduit, flow-control means in the other of said conduits for permitting flow of gas to said breathing member and normally preventing flow of gas away from said breathing member, means connecting said gas-absorption means with said other of said conduits, each of said flow-control means comprising an annular valve seat and a disk-like flutter valve composed of rubber and adapted to engage said seat and to yield when drawn or pressed against the same and carrying a central slide ring engaging a guide rod, transparent means to house each of said flutter valves, adjustable means operative upon the flow-control means in said other of said conduits to cause gas to pass both to and from said breathing member thru said other of said conduits, means to releasably maintain said absorption means in place, an expansible chamber connected with said other of said conduits, escape means for said expansible means, gravity means to control said escape means, and means to adjust said gravity means.

2,099,842
GAS FLOW MEANS FOR ANESTHETIC APPARATUS AND THE LIKE
Karl Connell, Branch, N. Y.
Application November 16, 1936, Serial No. 111,027
4 Claims. (Cl. 73—198)

1. Gas-flow means comprising a plurality of sources of gas under pressure, a flow gage, means for connecting said sources to said flow gage, means for controlling the flow of gas from said sources so that gas of a certain character will be flowing thru said gage at one time and gas of another character will be flowing thru said gage at another time, a scale unit rotatably mounted adjacent said gage and carrying a plurality of scales each movable by the rotation of said unit into a position substantially perpendicular to the side of said gage and with its edge in close proximity to said side, each of said scales being calibrated for the direct reading of the flow of gas of one of said characters, and said control means being adapted for the regulation of the amount of flow of the flowing gas, and means to releasably retain said unit in position for the easy viewing of the scale corresponding to the flowing gas.

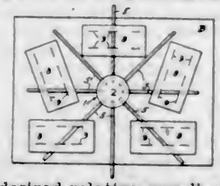


2,099,843
METHOD AND MEANS FOR THE FORMATION OF BREATHING TUBES AND THE LIKE
Karl Connell, Branch, N. Y.
Original application October 5, 1935, Serial No. 43,650. Divided and this application January 7, 1937, Serial No. 119,384
5 Claims. (Cl. 18—2)

1. The method of forming breathing tubes and the like which comprises molding and curing an expansible tube on a mandril, providing an expansion chamber including a container of sufficient capacity to receive the mandril, the end of said container being inserted between the tube and the mandril at one end thereof, introducing fluid pressure between the tube and the mandril to expand the tube beyond the mandril, removing the mandril into said container, and releasing the fluid pressure to collapse the tube.

4. Apparatus for the formation of breathing tubes and the like comprising a mandril, a container for the mandril of sufficient size to receive the mandril and having an end adapted to be inserted between one end of the mandril and of an expansible tube formed thereon to provide a closure at said end, means to provide a substantial closure at the other end of the mandril and tube, means to deliver fluid pressure between said tube and said mandril, and a jacket about said mandril to prevent undue expansion of said tube, said jacket having a length greater than the mandril.

2,099,844
FLAW DETECTOR MECHANISM
Harcourt C. Drake, Hempstead, N. Y., assignor to Sperry Products, Inc., Brooklyn, N. Y., a corporation of New York
Application November 17, 1933, Serial No. 698,399
4 Claims. (Cl. 177—311)



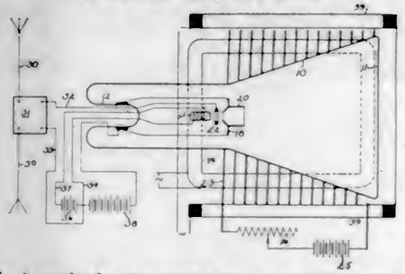
1. In a rail flaw detector mechanism, means responsive to flaws, a plurality of indicating means, means whereby said indicating means are actuated by said responsive means, means whereby one of said indicating means is normally conditioned to be operated and the other of said indicating means is normally conditioned not to be operated, means actuated by the rail joint, a rail joint indicator, means whereby said rail joint indicator is actuated by said rail-joint-actuated means, means whereby said rail-joint-actuated means conditions said first indicating means not to be operated when said responsive means passes over a rail joint, and means whereby said second indicating means is conditioned to be operated when said rail joint indicator is actuated.

2,099,845
APPARATUS FOR MOUNTING PRINTS AND THE LIKE
Bernard R. Dutcher, Bogota, N. J.
Application September 18, 1935, Serial No. 41,040
11 Claims. (Cl. 33—174)

1. An apparatus for assisting in mounting separate plural prints upon a sheet, said apparatus comprising means providing a relatively stiff bodily movable contour outline of each of the plural prints distinct from the prints; and means for mechanically bodily adjusting each stiff outline as a whole in distance apart relative to each other outline and adjusting each outline angularly independently of said adjustment in distance

and securing them in temporarily fixed relation with the major portion of each outline remote from exterior structure for coordinating said out-

lines in the desired relative coordinated positions of the prints one to another and maintaining said stiff outlines in said relative positions.



2,099,846

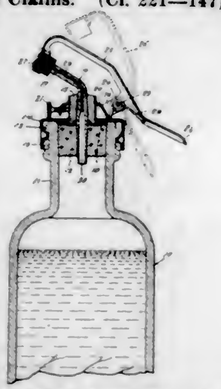
THERMIONIC OSCILLOGRAPH

Philo T. Farnsworth, San Francisco, Calif., assignor to Farnsworth Television Incorporated, a corporation of California

Application June 14, 1930, Serial No. 461,111

8 Claims. (Cl. 250—27.5)

6. A cathode ray apparatus comprising means for generating a slightly divergent pencil of cathode rays, a screen positioned to receive said rays and adapted to show a visible trace thereof, and means for establishing a magnetic field substantially parallel to the path of said rays and adapted to reconverge said rays to a focus substantially in the plane of said screen.



2,099,847

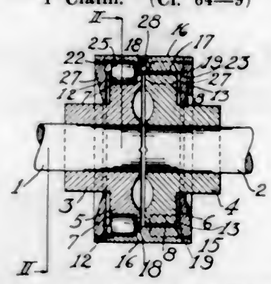
DISPENSING APPARATUS

Charles L. Gebauer, Cleveland, and William H. Brown, Bedford, Ohio, assignors to The Gebauer Chemical Company, Cleveland, Ohio, a corporation of Ohio

Application May 12, 1936, Serial No. 79,320

4 Claims. (Cl. 221—147)

3. In a device for dispensing volatile liquid in predetermined quantity, receptacle means for containing such liquid, closure means for normally preventing escape of any fluid from said receptacle means, means for segregating adjacent said closure a predetermined quantity of liquid from the main body thereof in said receptacle means, and means for opening said closure whereby such segregated liquid may be ejected from said receptacle means under the force of the vapor pressure of such volatile liquid.



2,099,848

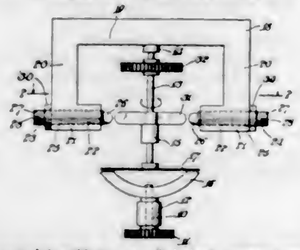
FLEXIBLE COUPLING FOR POWER DRIVE

Adolph F. Grodhaus, Baytown, Tex.

Application August 17, 1935, Serial No. 36,642

1 Claim. (Cl. 64—9)

A coupling comprising hubs respectively attached to the opposed ends of two shafts, each hub having a plurality of grooves spaced peripherally around an annular shoulder on said hub, a one piece annular sleeve encircling the hub shoulders, and having an internal diameter greater than the external diameters of the hub shoulders, a series of spaced grooves upon the inner surface of one end of said sleeve and extending inwardly to a point adjacent the center of the sleeve body, a series of identical grooves upon the inner surface of the other end of the sleeve disposed in staggered and overlapping relation to said first series, whereby an annular rib is formed, midway of the inner surface of the sleeve, and a plurality of staggered ribs extending longitudinally therefrom toward the ends of the sleeve, the grooves of each hub, when aligned with the grooves in the sleeve, forming a plurality of pockets in staggered and overlapping opposition, bearings of smaller diameter than the pockets disposed therein for driving engagement with the walls of the pockets and permitting lateral misalignment of the shafts, the annular rib being of lesser length than the thickness of the bearings.



2,099,849

ROTATIONAL TRIGGER MECHANISM

Frederick T. Holmes, Waterbury, Conn.

Application February 21, 1936, Serial No. 65,171

7 Claims. (Cl. 264—13)

1. In combination, a driving member and a driven member, and means for restraining movement of said driven member until a predetermined speed of rotation of the driving member is reached, said means including a magnetic holding device normally restraining the driven member against rotation, and operating mechanism connecting said members including a slip connection for rotating said driven member continuously after the force of said holding device is overcome by the attainment of said predetermined speed.

2,099,850

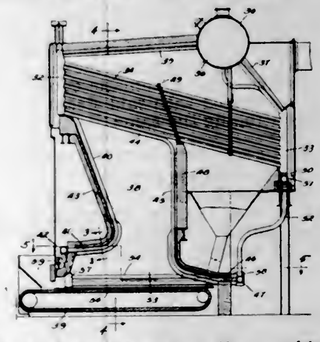
MOTOR FUEL

Frank A. Howard, Elizabeth, N. J., assignor to Standard Oil Development Company, a corporation of Delaware

No Drawing. Application July 2, 1930, Serial No. 465,450. Renewed April 13, 1935

3 Claims. (Cl. 196—150)

1. An improved fuel for high compression engines, operating on the Otto cycle, comprising a hydroformed oil, having a flash point above 100° F., an end point below 500° F. and inherent anti-detonation properties at least equal to those of a sweet uncracked gasoline from Mid-Continent crude, to which 30% of pure benzol has been added, the percentage being figured on the gasoline-benzol blend.



2,099,851

STEAM GENERATOR

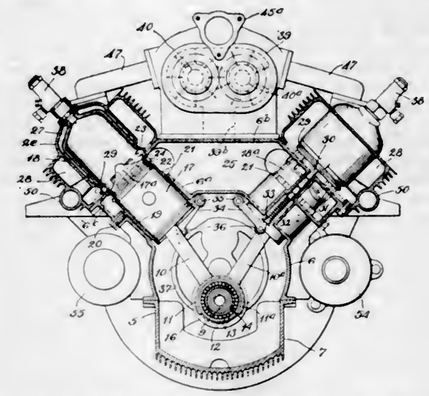
William Ross Irwin, Springfield, Ill., assignor to Springfield Boiler Company, Springfield, Ill., a corporation of Illinois

Application October 29, 1934, Serial No. 750,415

5 Claims. (Cl. 122—297)

1. In a steam generator, the combination of a boiler having inclined tubes, upper and lower headers for said tubes, a combustion chamber below the tubes, a stoker for supplying fuel to the combustion chamber, a water wall formed of tubes connected with an upper header and extending downwardly along the front of the furnace, a header connected with said tubes, horizontal tubes positioned on either side of the stoker along the adjacent portions of the walls, headers for said tubes, pipes connecting the rear headers of the tubes with the lower header of the boiler, and pipes connecting the front headers of the tubes with the header connected with the water wall tubes.

2,099,852



INTERNAL COMBUSTION ENGINE

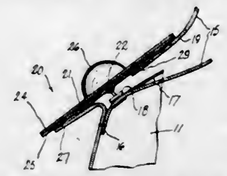
Carl H. Knudsen, Brooklyn, N. Y., assignor to Viking Diesel Motor Corporation, New York, N. Y., a corporation of New York

Application January 23, 1936, Serial No. 60,360

9 Claims. (Cl. 123—195)

1. An internal combustion engine comprising an elongated cylinder, said cylinder having centrally thereof circumferentially spaced exhaust ports and in close proximity thereto circumferentially spaced intake ports, a ring valve mounted upon the outer surface of the cylinder and

movable longitudinally thereof to open and close said exhaust ports, said valve being in operative connection with the crank shaft of the engine, and said valve being movable outwardly in the direction of the head end portion of the cylinder in the operation of opening said exhaust ports.



2,099,853

HANDBAG

Ernest Konelsky, Paris, France

Application October 17, 1936, Serial No. 106,079

12 Claims. (Cl. 150—42)

1. A generally rectangular ladies' handbag including an edge wall having parallel slits, a cross slit at one end thereof to constitute the material intermediate of the parallel slits, a strip-like closure connected at the other end to the container, releasable interconnecting means between the edges of the respective parallel slits, sliders for operating the individual interconnecting means, a rigid finger piece actuator member, means rigidly connecting the member to the sliders for moving the latter in true alinement with the interconnecting means, said member extending slidably transversely over the strip-like closure and having means for its manipulation intermediate of the sliders for actuating the latter as a unit.

2,099,854

ELECTRICITY METER

Fred Kurz, Springfield, Ill., assignor to Sangamo Electric Company, Springfield, Ill., a corporation of Illinois

Application December 29, 1934, Serial No. 759,651

10 Claims. (Cl. 308—159)

1. In combination with an electricity meter comprising a spindle, a disk secured to said

spindle, means for rotating said disk and spindle, and means pivotally supporting the upper end of said spindle, of means pivotally supporting the lower end of said spindle comprising a bearing housing including upper and lower housing members, said upper housing member having its lower end reduced in diameter and secured within and forming an abutment shoulder in said lower housing member, a bearing assembly within said bearing housing comprising a lower mounting member disposed in said lower housing member and an upper mounting member disposed in said upper housing member, jewels secured to said mounting members, a ball disposed between said jewels, means confined entirely in said lower housing member and normally urging said lower

mounting member upwardly with respect to said lower housing member, a shoulder formed on said lower mounting member, said latter shoulder directly engaging the abutment shoulder on said upper housing member and limiting upward movement of said lower mounting member with respect to said lower housing member, a conical portion formed on said spindle, a conical bore formed in said upper mounting member, the conical portion on said spindle being adapted to engage in the conical bore in said upper mounting member for supporting the lower end of said spindle thereon, and means formed on said upper mounting member for guiding said spindle into engagement with the bore in said upper mounting member.

2,099,855

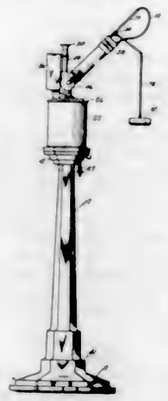
METHOD OF HYDROLYZING REACTIVE ACID LIQUOR

Robert B. Lebo, Elizabeth, N. J., and Benjamin T. Brooks, Old Greenwich, Conn., assignors to Standard Alcohol Company, a corporation of Delaware

No Drawing. Application December 10, 1935, Serial No. 53,708

8 Claims. (Cl. 260—156)

1. Method of manufacturing secondary alcohols by reaction of acids with olefins, which comprises reacting hydrating acids and olefins, diluting the acid reaction products, maintaining a temperature below about 25° C., settling the mixture into two layers, an acid liquor layer and a polymer layer, separating the layers, diluting the acid liquor layer, maintaining a temperature at which hydrolysis takes place, settling into two layers, and separately distilling alcohol from both layers.



2,099,856

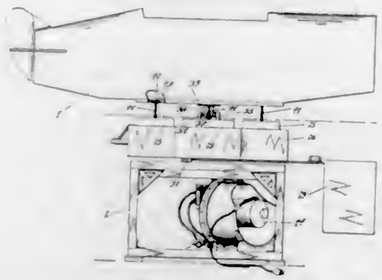
HAIR WAVING APPARATUS

Wilbur S. Lewis, Rocky River, Ohio, assignor to The Murlé Co., Cleveland, Ohio, a corporation of Ohio

Application December 11, 1933, Serial No. 701,823

7 Claims. (Cl. 132—36)

1. In an apparatus for curling hair, a hair receiving member upon which strands of hair are adapted to be wound from the ends inwardly toward the scalp, an enclosed chamber within which said wound hair is adapted to be disposed, a steam producing means, communicating means between said steam producing means and said enclosed chamber, and automatic control means operatively connected with said steam producing means for controlling the same.



2,099,857

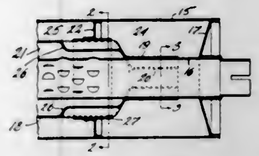
TRAINER FOR AVIATORS

Edwin A. Link, Jr., Binghamton, N. Y.

Application August 14, 1936, Serial No. 96,033

36 Claims. (Cl. 35—12)

1. A trainer comprising a frame, means for rotating said frame around a vertical axis, means for tilting said frame in simulation of an aeroplane in flight, a compass in said frame responsive to the directional positions thereof, and means associated with said compass and operable by the tilting and turning of said frame for deflecting said compass in simulation of the action of a compass in an aeroplane banking and turning in flight.



2,099,858

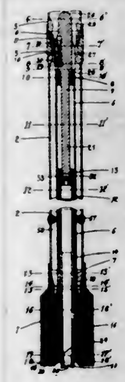
MUFFLER CONSTRUCTION

Roy J. MacKenzie and Lucien L. Haas, Buffalo, N. Y., assignors to Buffalo Pressed Steel Company, Buffalo, N. Y.

Application December 8, 1934, Serial No. 756,638

14 Claims. (Cl. 181—48)

1. A muffler including inner, outer and intermediate shells, a head connecting the outer and inner shell, said intermediate shell terminating at a distance from said head, a baffle dividing said intermediate and outer shells into separate sound deadening chambers, said inner shell forming a through passage for gases and sound waves and having perforations in portions thereof surrounded by said intermediate shell, said end of said intermediate shell having portions thereof pressed inwardly into contact with said inner shell and other longitudinal portions spaced from said inner shell to form a restricted passage connecting the space between said inner and intermediate shells with one of said chambers, and a tuning passage of much greater length than width connecting said chambers and terminating at opposite sides of said baffle, a portion of the wall of said passage being formed by one of the shells connected with said baffle.



2,099,859

COLLAPSIBLE ROTARY CORE DRILL

George A. Macready, Los Angeles, Calif.

Application April 16, 1935, Serial No. 16,650

28 Claims. (Cl. 255—72)

1. In a rotary drilling apparatus: a rotary drill pipe provided with a terminal fitting adapted to receive cutting blades; and an interior bodily removable organization including said blades, means for expanding said blades into said fitting and a core barrel extending between and above said blades, the lower portion of said blades being collapsible to overlap each other when unexpanded.

2,099,860

HORSE COLLAR

Robert McCubbing, Barrhill, Dalbeattie, Scotland, assignor to The McCubbing Pneumatic Harness Company, Limited, Dalbeattie, Scotland

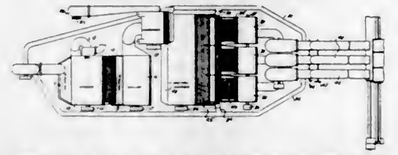
Application January 2, 1936, Serial No. 57,110

In Great Britain January 5, 1935

3 Claims. (Cl. 54—18)

1. A horse collar comprising an outer collar-shaped shell, a rigid inner shell fitting into and conforming in general shape to the shape of the outer shell, an inflatable pad backed by the inner shell, a soft pliable textile fabric jacket enclosing the pad and inner shell, lacing means for lacing the edges of the jacket together to detachably bind the pad to the inner shell, and means attached to the inner shell and protruding through the lacing means for detachably securing the inner shell to the outer shell.

2,099,861



PAD FILLING APPARATUS

Thomas L. McJoynt, Janesville, Wis.

Application February 5, 1934, Serial No. 709,685

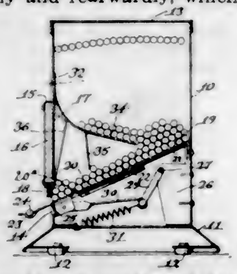
Renewed April 11, 1936

11 Claims. (Cl. 226—43)

1. Filling apparatus for a plurality of pad sections comprising the following instrumentalities, arranged serially, a primary disintegrator for preparing and cleaning raw filling material, a receiver for the material from the primary disintegrator and having means for forming it into a sheet of uniform density and thickness, means for severing said sheet longitudinally into strips, in number and width corresponding to the number and capacity of the pad sections to be filled, a secondary disintegrator, for comminuting said strips, maintaining them separately during treatment, and blower means receiving the separate masses of material from said secondary disintegrator and delivering the same separately to the said corresponding pad sections.

2,099,862

STRAW DISPENSING MACHINE



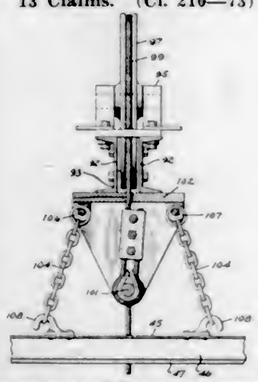
David Miller, Los Angeles, Calif.

Application May 11, 1936, Serial No. 79,096

3 Claims. (Cl. 312—79)

1. In a machine for dispensing straws and the like, a housing provided with a delivery opening, a spring-held plate arranged for sliding movement within said housing, a portion of which plate normally projects through said delivery opening, the projecting portion of which plate is provided with a straw-receiving groove, a flexible member depending from the upper edge of said delivery opening, a straw-agitating rib formed on said plate, a pair of inclined straw-guiding members secured to the lower portion of the inner face of

the front wall of the housing above and adjacent the ends of the delivery opening therein, a straw-supporting plate secured to the upper portion of the front wall of the housing and extending downwardly and rearwardly, which plate terminates above the rear portion of the sliding plate, and a vertically disposed plate secured to the intermediate portion of said last-mentioned plate and extending downwardly to a point just above the intermediate portion of said sliding plate.



2,099,863

CENTRIFUGAL EXTRACTING AND DISCHARGING MECHANISM

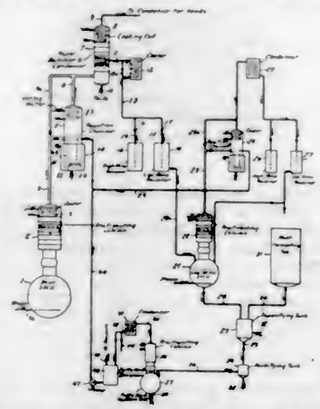
Edward L. Miller, Green Island, N. Y., assignor, by mesne assignments, to American Machine and Metals, Inc., New York, N. Y., a corporation of Delaware

Application April 21, 1933, Serial No. 667,157

13 Claims. (Cl. 210—73)

1. An extractor and discharging mechanism including in combination an extractor having a removable basket and a top closure therefor, means including a flexible running member which at one end engages the basket and at the other end engages the closure for removing the closure from the basket and the basket from the extractor and sheaves mounted above said basket and cover and over which the flexible members are passed for lifting the basket and cover by the flexible members.

2,099,864



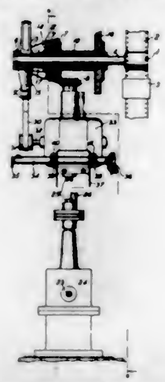
PROCESS FOR MANUFACTURE OF DISTILLED SPIRITS

Fred E. Miller, Philadelphia, Pa., assignor to Semet Solvay Engineering Corporation, New York, N. Y., a corporation of New York

Application May 26, 1934, Serial No. 727,618

3 Claims. (Cl. 99—48)

1. In the manufacture of a potable spirit of high ester content from fermented grain, the improvement which comprises distilling a fermented grain beer to form an alcoholic distillate having an alcohol content above 40%, distilling off an aqueous aliphatic acid concentrate from a fermented grain beer, neutralizing the acids of said concentrate by means of an alkaline calcium compound to form water-insoluble calcium compounds of acids containing more than 4 carbon atoms, mechanically separating the insolubles from aqueous solution, acidifying the insolubles to liberate free acids from said insoluble calcium compounds, subjecting the acids to distillation to form a distillate substantially free from acids containing more than 10 carbon atoms, esterifying the acids present in said distillate, and blending a quantity of the resultant esters with a much larger quantity of the aforesaid alcoholic distillate.



2,099,865

SOUND PICTURE SYSTEM

Edmund R. Morton, New York, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application October 12, 1934, Serial No. 748,028

14 Claims. (Cl. 271—2.3)

1. In a strip feeding mechanism, a cylinder for feeding said strip and means for driving said cylinder at uniform velocity comprising two drives for said cylinder driven by separate motors, said drives being connected in multiple through an elastic member independent of the strip fed by the cylinder.

2,099,866

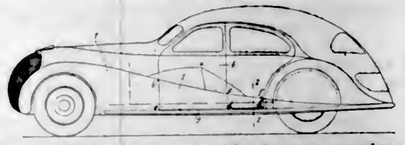
PHOTOGRAPHIC SHUTTER

William A. Riddell, Rochester, N. Y., assignor, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey

Application April 18, 1936, Serial No. 75,155

6 Claims. (Cl. 95—63)

5. In a shutter of the setting type, the combination with an annular shaped casing including an arcuate groove concentric with the casing, of a setting lever including a shoe slidable in said arcuate groove and a handle projecting from said casing, a master member, a pivotal support therefor carried by the shutter casing and movable connections between the master member and setting lever to move the former by the latter as the handle is moved concentric with the shutter casing.



2,099,867

BODY OF AUTOMOBILE VEHICLES

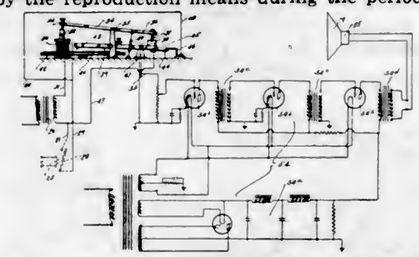
Leon Salves, Billancourt, France, assignor to Louis Renault, Billancourt, France

Original application January 22, 1935, Serial No. 2,975. Divided and this application June 19, 1936, Serial No. 86,205. In France August 1, 1934

1 Claim. (Cl. 293—57)

In a vehicle having a side frame member, a body and a fender member extending between the front and rear wheels of the vehicle secured to said body laterally thereof, a hollow casing secured to said frame member laterally thereof and forming a running board below said fender, the outermost face of said fender and the outermost face of said casing being substantially vertically aligned, and a bumper secured to and covering the aforementioned outermost face of said casing and projecting laterally therebeyond.

2,099,868



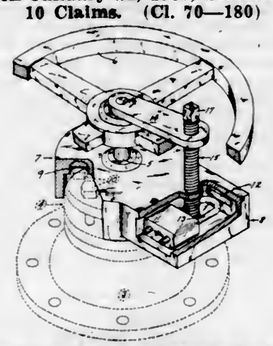
AUTOMATIC ANNUNCIATOR

Lang Jung Sing and Robert M. Waunch, Salem, Oreg.

Application January 26, 1935, Serial No. 3,619

3 Claims. (Cl. 274—15)

3. An annunciator system, the combination of a record reproduction means including a pickup, a pivoted bar, means urging the bar to normally engage the reproduction means and move it from a position terminating the reproduction of a record to a position to commence the reproduction of a record, an electromagnetic device connected to the bar operable when energized to move the bar against the action of the urging means to a position disengaging the reproduction means, a circuit for momentarily energizing the electromagnetic device, an electric switch closed by the reproduction means during the period of reproduction, and a holding circuit in series with the electromagnetic device and the switch.



2,099,869

VALVE LOCK

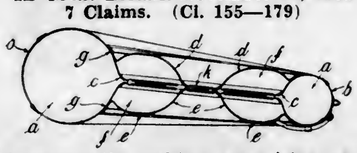
Theodore Lewis Stainbrook, Garber, Okla.

Application January 21, 1937, Serial No. 121,402

10 Claims. (Cl. 70—180)

1. A device of the class described comprising: a jacket adapted to cooperatively engage and encase a valve stuffing box and to be held against rotation about the stuffing box by said engagement; an anchor plate adapted to threadedly engage the valve control shaft outside the jacket; and lock means rigidly connecting the anchor plate and the jacket for preventing relative movement between the two in any direction.

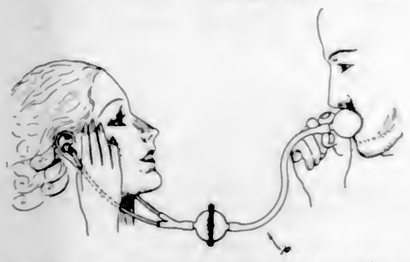
2,099,870



PNEUMATIC CUSHION

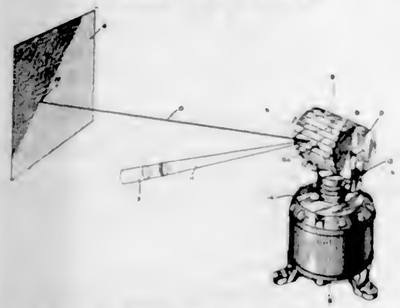
Henry Connah Stanley and William Henry Smith, Manchester, England

Application November 22, 1934, Serial No. 754,202



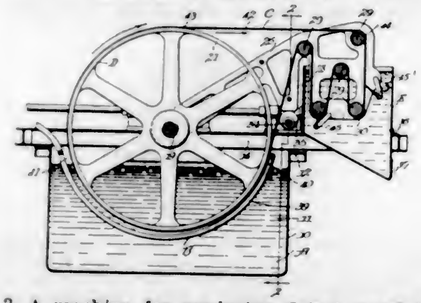
In Great Britain November 28, 1933

7 Claims. (Cl. 155—179)



1. A pneumatic cushion comprising an outer tubular ring of material impervious to air, and sheets of similar material of a shape corresponding to the space defined by said tubular ring but larger than said defined space, said sheets having outer marginal edges secured to the said outer tubular ring to form a second air compartment inwardly of said outer ring and with the said outer marginal edges overlying the said outer tubular ring and outside of said second air compartment and so that part of said outer ring forms a wall of the said second air compartment.

2,099,871
APPARATUS FOR EXERCISING THE HEARING ORGANS
Benjamin A. Stern, Los Angeles, Calif.
Application May 19, 1936, Serial No. 80,544
2 Claims. (Cl. 128—39)

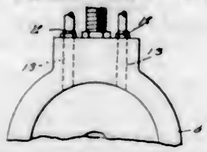


1. In an apparatus for treating the ears, the combination of: means forming a compressed air chamber; means for conducting compressed air from said chamber to both outer ear canals of a patient; a flexible diaphragm forming one wall of said compressed air chamber; means forming a compressing air chamber, the latter also having one of its walls formed by said diaphragm; and means connected to said compressing air chamber and adapted to receive breath under superatmospheric pressure from a person operating said apparatus to transmit this breath to said compressing air chamber and by the expansion of said diaphragm compress the air in said compressed air chamber, the increased pressure of the air in said compressed air chamber being transmitted to the outer ear canals of said patient.

2,099,872
SCANNING DEVICE
Milton M. Stern, Los Angeles, Calif.
Application February 26, 1934, Serial No. 712,913
Renewed October 19, 1936
7 Claims. (Cl. 178—7.6)

1. A device of the character described, including: a primary part mounted so as to turn on a primary axis; a plurality of reflectors disposed on said primary part around said primary axis, said reflectors being elongated in the direction defined by said primary axis, an end portion of each of said reflectors being converged toward said primary axis; means for giving said primary part rotary movement completely around said primary axis; and means for giving said primary part rotary movement completely around a secondary axis disposed at an angle to said primary axis in a timed relation to the rotary movement of said primary part relative to said primary axis.

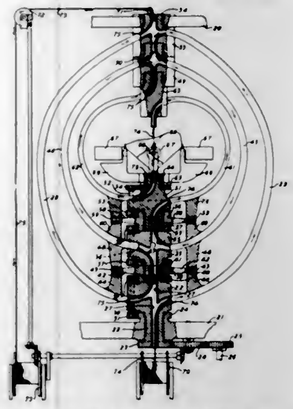
2,099,873
MACHINE AND PROCESS FOR PRODUCING FLAKE METAL BY ELECTRODEPOSITION
Martin M. Sternfels, Waterbury, Conn.
Application June 14, 1934, Serial No. 730,673
18 Claims. (Cl. 204—5)



2. A machine for producing flaked metal by electro-deposition comprising a bath, an anode, a continuously moving cathode, a washing bath, and means for passing the cathode and the deposit thereon through said washing bath, and means for agitating the bath for removing the deposit from the cathode in said washing bath.

9. The process of producing flaked metal by electro-deposition which comprises passing an endless flexible belt cathode over a curved surface in the plating bath, maintaining the curvature of the cathode and the deposit thereon fixed until a predetermined point is reached, disengaging the cathode from said curved surface and changing the curvature of the cathode to draw the belt away from the deposit and loosen the flakes.

2,099,874
METHOD OF EVACUATING VESSELS, MORE PARTICULARLY LAMPS
Carl Trenzen, Venlo, Netherlands
No Drawing. Application June 9, 1934, Serial No. 729,908. In Switzerland December 4, 1933
7 Claims. (Cl. 176—2)

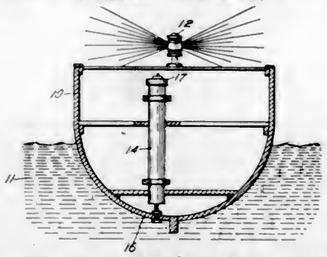


7. A method of evacuating vessels, and more particularly lamp bulbs, which consists in partially evacuating the vessel, then introducing a carbonyl of a metal of the group consisting of nickel, molybdenum, iron, tungsten, into the said vessel, heating the said vessel to cause decomposition of the said carbonyl, so that the air and traces of gas combine with the liberated CO, and then completing the evacuation of the said vessel.

2,099,875
WATER CLOSET
Cary J. Weaver, Goose Creek, Tex.
Application April 8, 1937, Serial No. 135,771
2 Claims. (Cl. 4—218)

1. In a water closet, a hopper provided with a ventilating opening, a nipple having an end fitting within said opening, a flange on the inner end of the nipple, a nut threaded on the outer end of the nipple for drawing the flange against the inner wall of the hopper, and a ventilating pipe connected at one end thereof with said nipple.

2,099,876
STRAND HANDLING APPARATUS
Leo L. Weaver, Cranford, N. J., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application June 9, 1934, Serial No. 729,750
7 Claims. (Cl. 117—9.5)



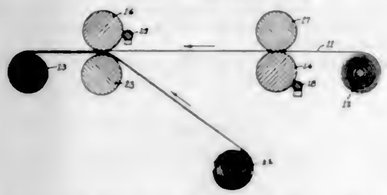
1. In a high speed serving head for winding a cover strand on a substantially torsionally rigid core strand advancing through the head, means to impose high speed rotation upon the core strand comprising a plurality of duplex fliers, the arms of the plurality of fliers defining a path for the core strand passing successively through one arm of each of the fliers to a winding point and passing from the winding point in inverse order through the respective other arms of the fliers, and means to supply a cover strand to the core strand at the winding point.

2,099,877
BAILER
Edward F. Westall, Alhambra, Calif.
Application November 22, 1935, Serial No. 51,043
13 Claims. (Cl. 166—19)

1. In a well bailer, a cylinder, a piston reciprocable within said cylinder, said cylinder being adapted to be raised and lowered relative to said piston, valvular means connected with the ends of said cylinder to release pressure fluid within the cylinder, a conduit from the chambers on opposite sides of said piston within said cylinder to a bailer bucket, and valvular means controlling said conduit adapted to open to suction and close to pressure within the cylinder.

2,099,878
AUTOMATIC ELECTRIC SAFETY LIGHT FOR LIFEBOATS
Gunnar A. F. Winckler, Worcester, Mass., assignor to Winckler Engineering Laboratories Incorporated, Boston, Mass., a corporation of Massachusetts
Application October 29, 1934, Serial No. 750,525
1 Claim. (Cl. 9—1)

In combination, a life boat for emergency use having a position-indicating means thereon for signalling continuously while the boat is in the water, a circuit in which the position-indicating means is permanently connected, and circuit control and energizing means permanently connected in circuit with said position-indicating means, and normally inactive and inoperative, for automatically coming into action and for unconditionally energizing the circuit immediately when the boat is dropped into the water, without the necessity of manually actuating any controls, regardless of the length of time that said energizing means has previously been in its inoperable condition, and for automatically deenergizing the circuit when the boat is hauled out of the water, the said control means comprising an enclosed compartment in said boat and having an opening at its bottom, for the influx of water to the water-level of the boat, a well in said compartment fixed to the wall thereof, and extending at least partly below the normal water-line of the boat, a pipe leading into the bottom of said well, a bushed connection communicating the said pipe in watertight manner with the opening in the bottom of the boat, so that the sea water can enter only into the well, a voltaic cell generator in said well having concentric electrodes spaced in fixed relation to each other, insulating discs at the top and the bottom of said cell serving to space the electrodes in said cell and also to space the cell with respect to said well, the bottom disc and the outer electrode having openings therein for the influx of sea water into said cell to serve as an electrolyte, leads permanently connected to said cell, a bushing in the top of said well, and a cable with which said leads are permanently connected and which extends through said last-mentioned bushing into permanent connection with said circuit, dropping of the boat into the water causing the influx of the water into the well and thence into the inter-electrode space of the cell to the normal water-line of the boat, thereby energizing the cell, and hence the circuit and the position-indicating means itself, and the removal of the boat from the water resulting in the flowing off of the electrolyte from the cell through the passages, and hence through the wall to the exterior, and consequent deenergization of the cell, without the necessity of breaking the fixed connections.



2,099,879

APPARATUS FOR PRINTING AND DRYING

Charles E. Wooddell, Niagara Falls, N. Y., assignor, by mesne assignments, to The Carborundum Company, Niagara Falls, N. Y., a corporation of Delaware

Application December 23, 1935, Serial No. 55,742

5 Claims. (Cl. 101—420)

2. Printing and drying apparatus of the character described comprising, in combination, a platen roll for supporting web sheet material previously printed on one side, means for printing the opposite side of said web sheet, a bilaterally faced granular coated web cooperating with said platen roll to prevent offsetting of the printed side of said web sheet during the second printing operation, means for moving said web sheet and said granular coated web and supporting the two webs in a continuous interleaved fashion whereby smearing of the printed images is prevented during the drying thereof.

2,099,880

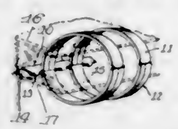
COMPOSITION OF MATTER ADAPTED FOR INCREASING THE WATER-RESISTANCE OF FIBROUS SUBSTANCES SPECIFICALLY PAPER PRODUCTS AND PROCESS OF MAKING SAME

Carleton Ellis, Montclair, N. J., assignor, by mesne assignments, to Ellis-Foster Company, Montclair, N. J., a corporation of New Jersey

No Drawing. Application November 22, 1929, Serial No. 409,185

3 Claims. (Cl. 134—22)

2. A paper sizing composition comprising a blown wax softened with an oil.



2,099,881

BINDING DEVICE

Charles E. Emmer, Chicago, Ill., assignor to Cercia, Inc., Chicago, Ill., a corporation of Illinois

Application October 16, 1935, Serial No. 45,175

6 Claims. (Cl. 129—1)

5. A binding device comprising a strip provided with a plurality of arcuate arms extending from the longitudinal edges of the strip and arranged in pairs adapted to be pressed into ring form, and means for connecting the free ends of each pair of said arms comprising projections and projection-receiving recesses adjacent each of said free ends, the recess of one arm of each pair being aligned with one face of the projection of said arm, the recess of the other arm of each pair being aligned with the opposite face of the projection of said arm, the arrangement being such that as said arms are pressed to ring form the projection of each arm serves as a guide to direct its mate into the cooperating receiving recess.

2,099,882

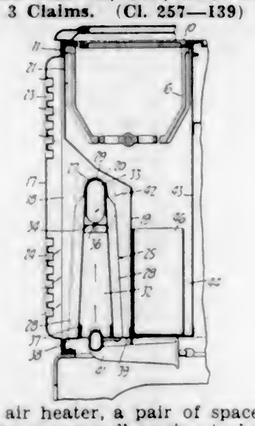
STREET SIGN

Ben H. Ernst, Buffalo, N. Y.

Application March 27, 1937, Serial No. 133,462

2 Claims. (Cl. 40—131)

2. A street sign of the class described comprising a frame including a plate stenciled to provide desired street name indicia, the upper longitudinal edge of said plate being bent upon itself to provide a longitudinally extending retention channel of a length commensurate with the plate itself, a glass panel disposed against the inner side of said plate, said panel being of a length less than the plate and less than said retention channel, and a detachable keeper channel secured also to the inner side of said plate adjacent the lower edge thereof and engageable with the lower adjacent edge of said glass panel, said keeper channel including an attaching flange and an offset channel-forming portion, the ends of said channel-forming portion terminating inwardly of the ends of said plate and being bent toward the plate and secured thereto to guard against endwise displacement of said glass panel.



2,099,883

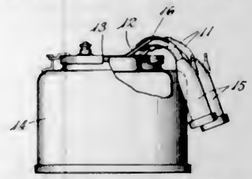
AIR CIRCULATING HEATER

Clarence R. Graham, Palo Alto, Calif., assignor to James Graham Manufacturing Co., San Francisco, Calif., a corporation of California

Application June 20, 1936, Serial No. 86,312

3 Claims. (Cl. 257—139)

1. In an air heater, a pair of spaced upright side walls, an upper wall serving to join the upper edges of the side walls, all of said walls being formed of one continuous piece of sheet metal, the space between said walls serving as a flow path for hot products of combustion, and corrugations formed in said walls, said corrugations forming a series of fins on the outer faces of said side walls and being flattened to form folds in said upper wall.



2,099,884

MILKING-MACHINE INFLATION

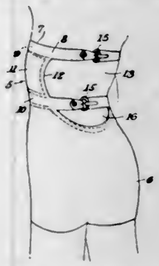
George W. Green, Wilmette, Ill., assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York

Application February 26, 1936, Serial No. 65,828

4 Claims. (Cl. 31—84)

3. An inflation for a milking machine, said inflation comprising a body provided with a tubular neck adapted to be mounted at the end of a tube of the machine and to close the tube by flexing of the neck to position its inner wall against the tube end, said flexible neck comprising portions in the region of the end of the tube of locally increased thickness as compared with the neck proper for preventing objectionably sharp localized bending in said region while permitting the neck to flex to close the tube end.

2,099,885



BATHING SUIT

Arnold Mogens Hansen, Jylland, Denmark

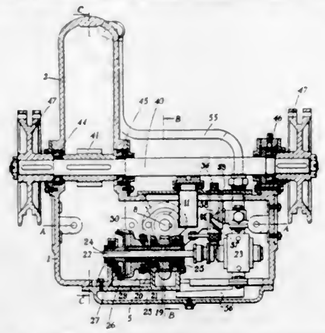
Application July 2, 1936, Serial No. 88,555

In Denmark August 30, 1935

3 Claims. (Cl. 2—67)

1. A shoulder-strapless bathing suit or the like having an upper portion and a lower portion, an upper resilient band along the top edge of the upper portion, an intermediate resilient band at the waist of the suit, said bands being adapted to completely encircle the body of a wearer, and a bust covering area between said bands, said area having lateral edges terminating along the sides of the garment.

2,099,886



HYDRAULIC HOIST

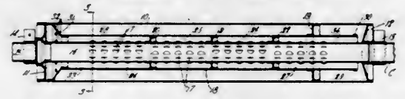
Paul Rudolph Hasson and Norman Choate Storey, Leeds, England

Application August 16, 1935, Serial No. 36,598

16 Claims. (Cl. 97—50)

1. In a motor driven tractor, a soil working implement assembly adapted to be raised and lowered, arranged at the rear end thereof, a rotary member, means connecting said assembly to said member for lifting said assembly upon rotation of said member, hydraulic mechanism including a piston-driven rack and a pinion on the rotary member for rotating said member, a clutch-controlled pump for setting said hydraulic mechanism in action from the motor of the tractor to raise said assembly, when required, and means for

lowering said assembly through said hydraulic mechanism when required.



2,099,887

MUFFLER

Laurence R. Heath, Buffalo, N. Y., assignor to Buffalo Pressed Steel Company Inc., Buffalo, N. Y.

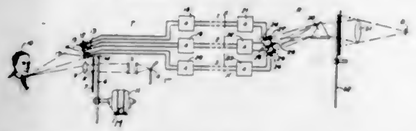
Application May 26, 1934, Serial No. 727,649

7 Claims. (Cl. 181—48)

1. A muffler comprising an imperforate outer shell, apertured end heads connected to said outer shell, a conduit connecting with the apertures in said heads to provide a through passage for exhaust gases, said conduit having a portion of its length provided with a plurality of relatively small apertures, an intermediate shell continuous from end to end thereof and having both ends spaced from said heads, a partition between said conduit and said intermediate shell and dividing the space between said conduit and intermediate shell into a plurality of inner elongated chambers a partition dividing the space between said intermediate and outer shell into a plurality of outer resonator chambers, the inner chamber at each end of the muffler communicating around the adjacent end of the intermediate shell with a resonating chamber, said conduit being provided with apertures opening into each inner chamber and being provided with an imperforate portion near an end of said conduit forming with the intermediate shell a resonator neck connecting with a resonator cavity.

2,099,888

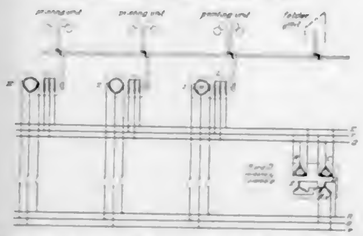
METHOD OF MAKING SELF-STERILIZING BRUSHES



Warren E. Hill, Northampton, Mass., and Frederic A. Parkhurst, Bethesda, Md., assignors to Pro-phy-lac-tic Brush Company, Northampton, Mass., a corporation of Delaware

No Drawing. Application December 15, 1933, Serial No. 702,604

7 Claims. (Cl. 300—21)



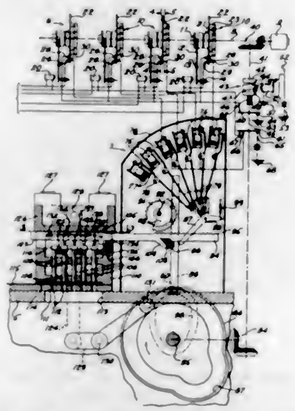
1. The method of making a self-sterilizing brush which comprises treating the bristles with a solution of a phenyl mercuric salt, and treating the bristles with an agent adapted to react with the phenyl mercuric salt to form a phenyl mercuric salt which is less soluble in water.

2,099,889
TELEVISION SYSTEM
Herbert E. Ives, Montclair, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application August 18, 1933, Serial No. 685,685
8 Claims. (Cl. 178—5.4)

1. Electro-optical apparatus for producing images in color, comprising a plurality of light sources each emitting a strip of diffused light, the respective strips comprising light waves of different lengths within the range for which the eye is sensitive and simultaneously controlled by incoming image currents, means acting upon said light waves to form a superposed image of said sources, and a helix of mirrors for directing light from said superposed image to a field of view.

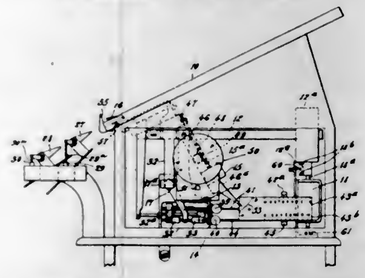
2,099,890
MEANS FOR REGULATING THE SPEED OF POLYPHASE ALTERNATE CURRENT MOTORS
Henry Vincent James, Radlett, England
Application October 15, 1934, Serial No. 748,398
In Great Britain and Northern Ireland October 24, 1933
2 Claims. (Cl. 172—274)

1. A double induction regulator for a plurality of electric motors of the alternating current commutator type where said motors are allocated each to an individual unit of a multiple unit line type printing press, said double induction regulator electrically connected in parallel to the rotors of said motors and energized from constant supply, said regulator having movable control members, and a driving device comprising quadrants for driving said control members, a disc rotatable on the axis of the quadrants, cam grooves in said disc, links connected to the quadrants and movable in the cam grooves, means for guiding the cam groove connected ends of the links in right lines, and means for operating the disc.



2,099,891
FOUNTAIN PEN
Karl Y. Johannesson, Berwick, Pa.
Original application July 20, 1933, Serial No. 681,265. Divided and this application July 19, 1935, Serial No. 32,143
13 Claims. (Cl. 120—48)

1. In a fountain pen having a barrel, an air vent member in the barrel, a hollow cap secured to the barrel and securing the air vent member in position, said air vent member including a stem having a bore therethrough leading to the interior of the cap, a valve normally closing said vent member against passage of air to the interior of the cap but operative to establish communication between the barrel and cap upon increase in air pressure in the bore of the stem

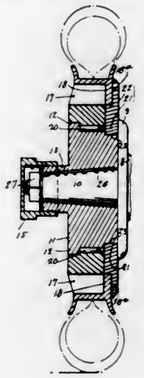


beyond a predetermined amount, a duct leading from the interior of the cap to the atmosphere, and valve means associated with the air vent member and operative in response to variations in level of the ink in the pen barrel to close said air vent member against passage of air therethrough.

2,099,892
PERFORATING APPARATUS
Harold G. Johnstone, Chicago, Ill., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application January 15, 1935, Serial No. 1,840
3 Claims. (Cl. 164—115)

1. In a perforating apparatus, a plurality of punches arranged in columns of five to a column and designed to be operated to punch combinations of holes representative of the digits one to nine, and a selector associated with a column of punches movable to any one of nine positions and adapted to select a different punch in each of positions one, three, five, seven and nine and to select one punch and one of the other four punches in the other four positions respectively.

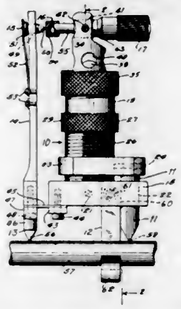
2,099,893
MACHINE FOR GRADING OR SORTING BY WEIGHT
William Jones, Soho Foundry, Birmingham, England, assignor to John Oliver Powell, Gorseinon, near Swansea, Wales, England
Application May 15, 1935, Serial No. 21,570
In Great Britain May 18, 1934
8 Claims. (Cl. 209—121)



1. A machine for grading or sorting by weight embodying a weighing mechanism, a load receiving device from which the load tends to fall under the action of gravity, electrically controlled means for locking the weighing mechanism, electrically controlled means for restoring the weighing mechanism to the normal equilibrium position after a grading or sorting operation has been performed, electrically operated deflector mechanism associated with the weighing mechanism and adapted to be brought into operation for directing the load into a specified channel according to its grade or weight, movable means carrying the switch controlling the aforesaid locking means, means for electrically actuating said switch carrying means, means for delaying the movement of said switch carrying means and a switch incorporated in the load receiving device and adapted to be actuated by the loading of the load receiving device the actuation of said switch on the reception of a load effecting the unlocking of the weighing mechanism, the placing of the restoring means out of action and the actuation of the delay action switch carrying means.

2,099,894
EMULSIFYING OIL
Arthur Gustav Kaufmann, Associated, Calif., assignor, by mesne assignments, to Tide Water Associated Oil Company, a corporation of Delaware
No Drawing. Application April 20, 1935, Serial No. 17,539
8 Claims. (Cl. 167—43)

1. An emulsifiable oil comprising: a hydrocarbon oil compounded with Koeme oil.

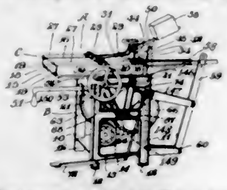


2,099,895
DEMOUNTABLE TIRE RIM
Andrew Kendzierski, Buffalo, N. Y.
Application June 12, 1936, Serial No. 84,960
3 Claims. (Cl. 301—11)

1. In a structure of the class described, a cylindrical hub member provided adjacent its outer face with an outstanding stop flange, an annulus fitted over said hub, abutting and surrounding said flange, said annulus being provided with marginal lug accommodation notches, anti-friction rollers interposed between the annulus and hub, an abutment ring surrounding said hub and keyed thereto and abutting said annulus, said abutment ring being provided with keeper notches

with which the notches in said annulus may be registered or disaligned at will.

2,099,896
INDICATING EXTENSOMETER
Augustus B. Kinzel, Flushing, N. Y., assignor, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York
Application September 24, 1932, Serial No. 634,695
18 Claims. (Cl. 33—148)

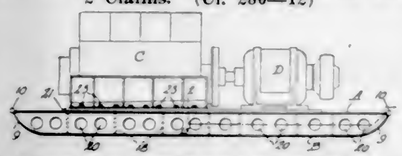


1. An extensometer adapted for being mounted on a test specimen and comprising a body; a mobile leg; a stationary leg; and means for clamping said legs to a test specimen with greater pressure on said stationary leg than on said mobile leg, said means comprising a member partially encircling said test specimen and provided with a contact surface a fixed distance from said body engaging the opposite side of said test specimen from said legs relatively closer to said stationary leg than to said mobile leg.

2,099,897
ADJUSTABLE CUSHION FILLING MACHINE
Martin H. Lang, Minneapolis, Minn.
Application May 11, 1935, Serial No. 21,006
8 Claims. (Cl. 226—46)

1. A stuffing machine including an adjustable stuffing box including upper and lower sections having means for adjusting the width thereof, a base upon which said sections are mounted, means for adjusting the depth of said stuffing box, means for operating said stuffing machine to automati-

cally insert the stuffing material into the cushion covering and hinge means for said upper sections



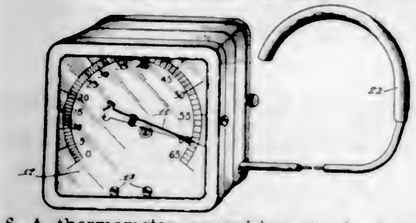
interposed between said stuffing box depth adjusting means and said base.

2,099,898

PORTABLE FOUNDATION FOR MACHINERY

Elwood T. Larkin, Eggertsville, N. Y., assignor to Charles A. Criqui, Buffalo, N. Y.

Application September 16, 1935, Serial No. 40,772
2 Claims. (Cl. 280—12)



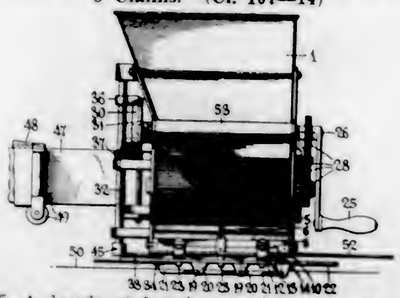
1. A portable foundation for machinery, including horizontal upper and lower plates which are substantially coextensive with said foundation and which are spaced apart throughout the greater portion of their length and which converge at their ends, a transverse bar at each end of said foundation and rigidly secured to the ends of said plates, upright side plates rigidly secured to the edge portions of said upper and lower plates and extending substantially throughout the length of said foundation, a plurality of upright webs arranged in the space between said upper, lower and side plates for reinforcing said foundation and welded to said plates and to each other, said lower plate being provided with openings spaced to permit welding of said webs to said plates and to each other, a series of apertures in said side plates and webs and arranged in alinement to permit insertion of a bar transversely of said foundation, and strips of metal welded to the top surface of the upper plate and forming pads on which machinery may be placed and also reinforcing said foundation.

2,099,899

THERMOMETER

Reynold T. Hedfield and Hans Seegers, Chicago, Ill., assignors to Jas. P. Marsh Corporation, Chicago, Ill., a corporation of Illinois

Application November 4, 1936, Serial No. 109,078
11 Claims. (Cl. 73—369)



6. A thermometer comprising standard cup-like gauge housings secured back to back to form a partition therebetween, a pressure gauge in one of said housings, and an elongated capillary tube having a thermostatic bulb thereon normally stored in the other housing and operatively connected to said gauge and capable of being fully extended from said other casing, said bulb being longer than any internal dimension of said housing and formed in a hook-shape whereby it may be hooked to and suspended from any convenient part of the interior of a refrigerator.

2,099,900

DOUGHNUT FORMING MACHINE

Frederick Maier, Buffalo, N. Y.

Application June 2, 1936, Serial No. 83,149
5 Claims. (Cl. 107—14)

5. A doughnut forming machine comprising a frame having a hopper, an extruding die supported beneath the hopper, means for feeding the dough from the hopper through the die, means removably securing the die to the frame, severing means movably supported on the die and removable from the frame with the die as a unit, and means mounted on the frame for operating the severing mean, said severing means having a part interlocking with said operating means for establishing a driving connection therebetween and permitting disconnection of the severing means from the operating means when the unit is removed from the frame.

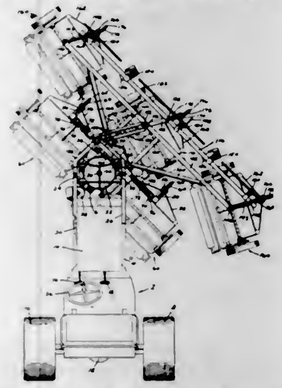
2,099,901

COMBINED COLLAR HOLDER AND TIE CLASP

William J. Morse, Attleboro, Mass., assignor to Morse Andrews Co., a corporation of Massachusetts

Application August 27, 1934, Serial No. 741,655
8 Claims. (Cl. 24—73)

1. In combination, a collar holder having a front member and a rear member, the contiguous ends of said members being adapted to releasably grip the tabs of a collar, a support element secured to said collar holder intermediate said ends, and a tie clasp secured to said support element.



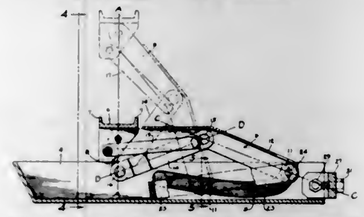
2,099,902

TRACTOR PROPELLED GANG LAWN MOWER

Amos F. Moyer and Gustave C. Kleidon, Minneapolis, Minn., assignors, by mesne assignments, to Toro Manufacturing Corporation of Minnesota, a corporation of Minnesota

Application August 5, 1931, Serial No. 555,158
Renewed June 30, 1936
33 Claims. (Cl. 56—7)

1. In a gang lawn mower comprising a tractor having steering means, and front and rear transverse rows of mower units connected to the tractor to be propelled thereby, unit steering means associated with said tractor steering means for



steering one row of said units in such manner as to cause its swaths to be overlapped by the swaths of the other row of units when the gang is proceeding around a curve.

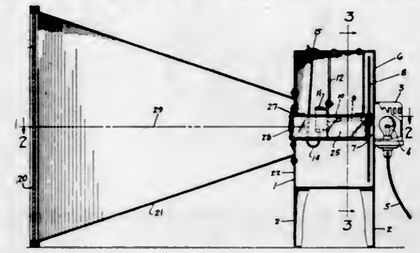
2,099,903

LIFTING APPARATUS

Harold Nilson, Wayzata, Minn., assignor of one-third to John A. Edeby, Wayzata, Minn., and one-third to Emil Berglund, Minneapolis, Minn.

Application October 26, 1936, Serial No. 107,622
3 Claims. (Cl. 254—9)

1. In an apparatus of the class described, a base member having a cam-shaped guide formed therein, said guide having a substantially vertically disposed portion, an arcuate portion, and a substantially horizontal and upwardly inclined portion, a lifting head, an arm having its upper end pivotally connected to said head and its lower end operatively engaged with said cam-shaped guide, a link pivotally connected to said base and to said arm, and means for imparting a force to the lower end of said arm to elevate said head, said cam-shaped guide and said link serving to guide said head during movement thereof along a substantially straight vertical axial line.



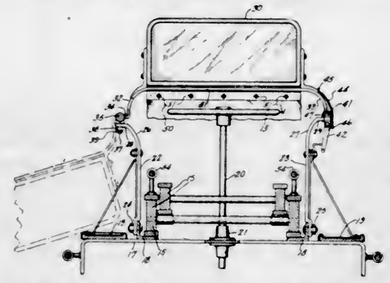
2,099,904

METHOD OF KALEIDOSCOPIC PROJECTION AND APPARATUS THEREFOR

Edmund W. Pennington, Minneapolis, and Charles E. Porter, Jr., St. Paul, Minn., assignors to Vivid-Ad, Inc., Minneapolis, Minn., a corporation of Minnesota

Application May 27, 1935, Serial No. 23,650
5 Claims. (Cl. 88—24)

1. A device of the class described comprising a light source, a projection screen, a kaleidoscopic projection system operably interposed between the source and the screen, a pair of disks of light-transmitting material arranged between the light source and the kaleidoscopic system and having portions of their peripheries overlapped in the field of illumination, each disk



having light-intercepting delineations which move across the field of illumination, and means for automatically rotating the disks, said screen having delineations thereon with which the kaleidoscopic images are related in a predetermined and significant manner including a mask making part of the screen opaque.

2,099,905

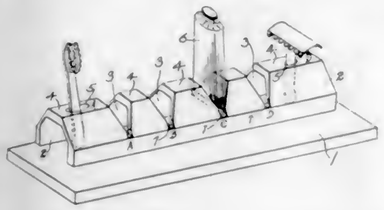
TILLERMAN'S WINDSHIELD FOR LADDER TRUCK TRAILERS

Peter Pirsch, Kenosha, Wis., assignor to Peter Pirsch and Sons Co., Kenosha, Wis., a firm composed of Peter Pirsch, W. R. Pirsch, and Ceila Pirsch Even

Application June 10, 1936, Serial No. 84,432
11 Claims. (Cl. 296—85)

1. A vehicle windshield assemblage comprising supporting means, a windshield, a pivot disposed horizontally at one side of the windshield for hingedly connecting said windshield to the supporting means, said pivot extending at right angles to the plane of the windshield when the latter is in operative position to provide for lateral swinging movement of the winshield in a substantially vertical plane directly from operating position to an inverted inoperative position, and means for releasably locking the other side of the windshield in operative position.

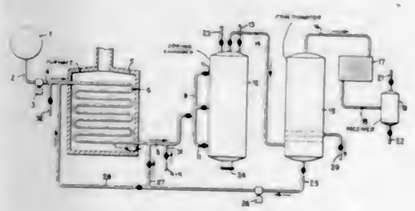
2,099,906



ARTICLE HOLDER

Myrtle Pierce Reese and Christian A. Volf, Jr., New York, N. Y.; said Volf, Jr., assignor to said Reese

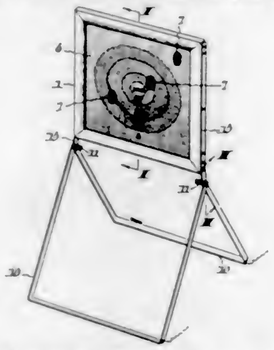
Application March 4, 1936, Serial No. 67,139
6 Claims. (Cl. 132—79)



1. A holder for toilet articles, collapsible tubes and the like comprising an elongated arched

member having therein a plurality of downwardly extending substantially V-shaped transverse slots

adapted to individually receive the folded end of a collapsible tube.

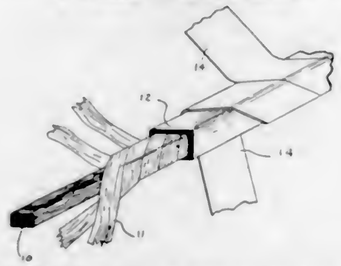


2,099,907
DISTILLATION OF HYDROCARBON OILS
Marvin C. Rogers, Chicago, Ill., assignor to Standard Oil Company (Indiana), Chicago, Ill., a corporation of Indiana
Application December 20, 1933, Serial No. 703,190
3 Claims. (Cl. 196—65)

3. A method of processing heavy hydrocarbon oil to produce gasoline which comprises passing said oil in a confined stream through a tubular heating coil, heating said oil during its passage through said coil to cracking temperature, controlling the temperature and time of treatment of the oil within said coil with respect to each other to effect the maximum cracking of the oil within the coil while avoiding troublesome coke deposits therein, passing the converted products from said heating coil into a reaction zone wherein further conversion is effected and vapors separate from residue, introducing air into the cracked products from said tubular heating coil in an amount of about 3.2 cubic feet of air at 60° F. for each gallon of oil treated to further heat said oil by partial combustion thereof to a temperature not more than about 40° F. above that obtained in the heating coil, separately removing the vapors from said reaction zone and subjecting them to fractionation to separate a gasoline distillate fraction relatively free of gum-forming constituents.

2,099,908
TARGET
Mitchell G. Rosengarten, Philadelphia, Pa.
Application June 17, 1936, Serial No. 85,663
1 Claim. (Cl. 273—35)

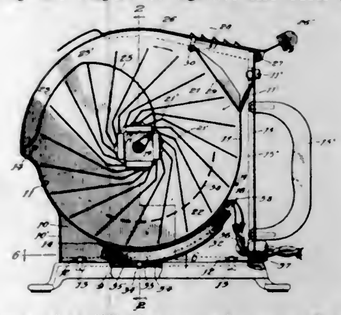
Game apparatus comprising a plain cardboard missile-disc, adapted to be propelled by a stroke of a golf-club against its edge, and a target therefor faced with projecting bristles of such length and resiliency and so spaced as to impale, receive amongst them, and hold the margin of the plain



cardboard missile-disc itself, and adapted thus to retain and support it where it strikes.

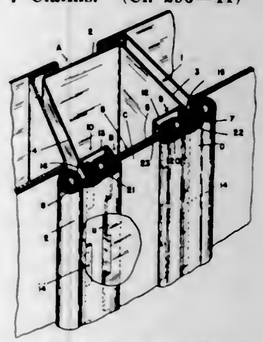
2,099,909
PREPARATION OF ANHYDRIDES BY THE USE OF KETENE
Karl T. Steik, Clifton, and Anthony H. Gleason, Elizabeth, N. J., assignors to Standard Oil Development Company, a corporation of Delaware
No Drawing. Application August 13, 1931, Serial No. 556,940
4 Claims. (Cl. 260—123)

1. The process which comprises reacting ketene with naphthenic acids to form a mixed anhydride of said naphthenic acids and acetic anhydride.



2,099,910
TACKING STRIP
Otto Thiel, Detroit, Mich.
Application July 6, 1936, Serial No. 89,157
6 Claims. (Cl. 117—53.5)

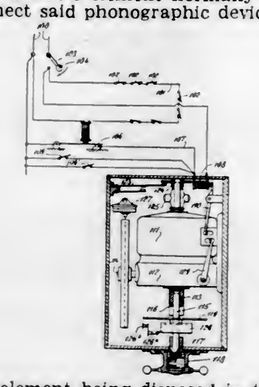
1. In a tacking strip, a core, an encasing thick coating of asphalt outside said core, and an outer skin of thin flat smooth paper ribbon.



2,099,911
CORN POPPER
Herbert L. Thompson, Elgin, Ill.
Application August 17, 1936, Serial No. 96,345
17 Claims. (Cl. 53—4)

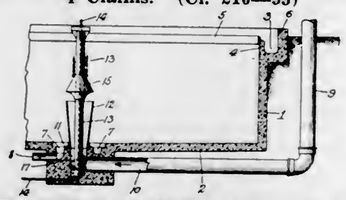
2. A corn popper comprising a base, a casing mounted on the base and providing a popping chamber, a heating element supported adjacent to the popping chamber, a slotted guard at the top of the popping chamber, a delivery apron, a plurality of fingers within the chamber and operating in the slots of the guard, and means for revolving the fingers to agitate the corn in the

chamber and to lift the popped corn and push it over the guard and discharge it onto said apron.



2,099,912
VEHICLE PILLAR STRUCTURE
Paul H. Travis, Detroit, Mich.
Application April 29, 1935, Serial No. 18,940
7 Claims. (Cl. 296—44)

1. In combination, a pillar having a portion forming a seat for a trim panel, and provided upon opposite sides of said portion with outwardly opening channels, opposite sides of each of said channels having inturned tongues, weather strips in said channels and held against displacement by said tongues, and a trim panel on said seat and positively held against displacement by portions of said weather strips.

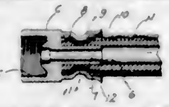


2,099,913
AUTOMATIC TELEPHONE SIGNALING APPARATUS
Jean Edouard Tuscher, Petit Ivry, and Marcel Spiro, Paris, France, assignors, by mesne assignments, to Signaphone Corporation of America, Wilmington, Del., a corporation of Delaware
Application September 20, 1934, Serial No. 744,834
In France December 6, 1931
10 Claims. (Cl. 179—5)

1. In an alarm system, an automatic exchange telephone line, a protective circuit, a motor, means responsive to electrical disturbance of said circuit for starting said motor, a dialling switch, a helicoidally advancing drum operated by said motor, spaced cam disks on said drum for successively actuating said switch to automatically connect said line to a particular station, a phonographic device for sending an alarm message, and a second switch spaced from said first switch including a movable element normally in position to disconnect said phonographic device from the

line, said element being disposed in the path of said drum in position to be positively engaged and displaced thereby subsequent to dialling to connect the phonographic device to the line.

2,099,914
METHOD OF AND APPARATUS FOR INFLUENT SUPPLY
Ferdinand F. Waechter and Harold F. Watson, Philadelphia, Pa., assignors to Link-Belt Company, Chicago, Ill., a corporation of Illinois
Application May 13, 1936, Serial No. 79,486
4 Claims. (Cl. 210—55)

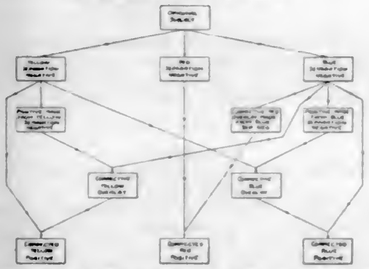


4. The method of diffusing an incoming current of liquid throughout a body of liquid which comprises the steps of directing the influent column of liquid along a generally horizontal path, then gradually changing its direction of flow to a generally vertical path, then gradually increasing the cross sectional area of the column as it proceeds forwardly, then imparting to the expanded column of liquid a rotary movement about its longitudinal axis of flow and then discharging the column of liquid directly into the main body of the liquid.

2,099,915
HOSE COUPLING
Albert J. Weatherhead, Jr., Cleveland, Ohio, assignor to The Weatherhead Company, Cleveland, Ohio, a corporation of Ohio
Original application December 18, 1931, Serial No. 581,893, now Patent No. 2,000,680, dated May 7, 1935. Divided and this application April 24, 1935, Serial No. 17,937
1 Claim. (Cl. 285—84)

In a hose coupling having a metallic body portion provided with an integrally connected nipple, radial wall and outer sleeve, and a hose arranged within the annular space defined by said nipple, wall and sleeve, means for securing said coupling on said hose comprising an inwardly extending compression rib formed on the outer sleeve, the

construction and arrangement being such that the hose material is forced against said radial



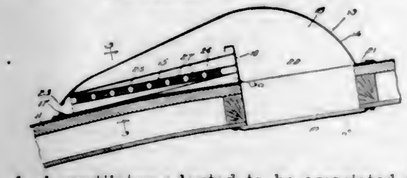
wall and the end of the sleeve is flared outwardly for reducing the abrasive effect of the end of the sleeve on the hose material.

2,099,916

COLOR CORRECTED PRINTING

William J. Wilkinson, Eastchester, N. Y., assignor of one-half to Miehle Printing Press and Manufacturing Company, Chicago, Ill., a corporation of Illinois

Application November 21, 1935, Serial No. 50,867
15 Claims. (Cl. 95—5.1)



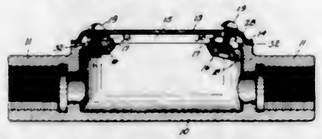
2. In the art of printing, making a set of yellow, red and blue separation-negatives of the subject through violet, green and orange filters respectively, making a first positive of the yellow-separation negative, making a yellow overlay from a combination of said first positive and said blue-separation negative, making a color-corrected yellow printing-plate from said overlay and said yellow-separation negative, making a red positive overlay from said blue-separation negative, making a color-corrected red printing-plate from said red-separation negative and said red overlay, making a third positive of said blue-separation negative, making a blue overlay from a combination of said yellow-separation negative and said third positive, making a color-corrected blue-separation printing-plate from a combination of said blue-separation negative and said overlay, and printing in superposed relation with said printing-plates.

2,099,917

VENTILATING DEVICE FOR CARS AND THE LIKE

Nicholas L. Willer, Chicago, Ill., assignor to Railway Utility Company, Chicago, Ill., a corporation of Illinois

Application June 3, 1935, Serial No. 24,593
12 Claims. (Cl. 98—19)



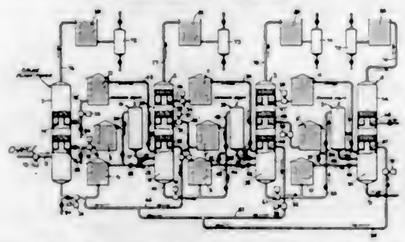
1. A ventilator adapted to be associated with a ventilating opening in a car or the like, comprising a casing having an open end adapted to be connected to the car opening, said casing also having a wall with aspirating openings therein and along which outside air sweeps as the car moves along, there being a tendency to exhaust air through said wall openings as the car moves along, and means directly associated with said wall and projecting both above and below said openings for neutralizing the tendency of air to exhaust through said openings.

2,099,918

COVER FOR CONDUIT OUTLET BOXES

Daniel B. Winter, Syracuse, N. Y., assignor to Crouse-Hinds Company, Syracuse, N. Y., a corporation of New York

Application June 10, 1936, Serial No. 84,493
2 Claims. (Cl. 247—15)



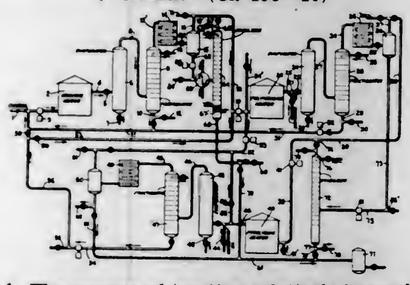
1. The combination of a conduit outlet box having an opening in one side, of a cover for the open side having a marginal bearing face overlying the edge wall around the opening, a channel member arranged on the under side of the cover adjacent said marginal face with the sides of the channel extending toward said marginal face, said channel and cover being provided with a complemental projection and aperture, with the projection extending through the aperture and being swedged over to secure the channel to the cover, a nut arranged in the channel member, a screw extending through the cover from the outside thereof and threading in the nut, the nut and channel member having coacting surfaces to effect movement of the nut toward the marginal edge of the cover and into engagement with the side wall of the box when the screw is threaded into the nut.

2,099,919

PROCESS FOR THE TREATMENT OF HYDROCARBON OIL

Maurice H. Arveson, Highland, Ind., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana

Application December 29, 1934, Serial No. 759,620
10 Claims. (Cl. 196—49)



1. The process of treating hydrocarbon oil which comprises subjecting heavy oil to distillation to form a condensate fraction and a liquid residue, cracking said condensate and said liquid residue by passing each through a separate heating zone in a stream of restricted cross-sectional area wherein a cracking temperature is attained and conversion occurs, introducing the resulting cracked products into a first separating zone wherein vapors separate from liquid residue, subjecting said vapors to a fractionating operation to form a final desired distillate and a reflux condensate, subjecting said reflux condensate to cracking by passing it through a heating zone in a stream of restricted cross-sectional area wherein said condensate is raised to a cracking temperature and subjected to conversion, combining the resultant stream of hot cracked products with said liquid residue last mentioned and maintaining the combined constituents at a cracking temperature to effect conversion of said liquid residue, introducing the resulting cracked products into a second separating zone wherein vapors separate from liquid residue and fractionating said vapors to form an additional quantity of final desired light distillate.

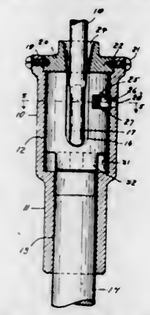
2,099,920

PROCESS OF TREATING HYDROCARBON OIL

Harold V. Atwell, White Plains, N. Y., assignor to Gasoline Products Company, Inc., Newark, N. J., a corporation of Delaware

Application September 19, 1933, Serial No. 690,055
7 Claims. (Cl. 196—10)

1. The process of treating relatively heavy hydrocarbon oil for the production of gasoline which comprises subjecting said hydrocarbon oil to a cracking operation to cause formation of relatively high anti-knock gasoline fractions, separating from the resulting cracked products distillate falling in the desired boiling range but having an end point of from 250° to 300° F., that is to say, an end point lower than that desired for the final product, a condensate containing constituents boiling above 300° F. and within the upper portion of the boiling range of the desired product, heavier products and gas, returning at least a part of said condensate to the cracking operation for further treatment, subjecting said gas to heat and pressure to effect conversion of constituents thereof to liquid in the desired boiling range and heavier normally liquid hydrocarbons, recycling heavier normally liquid hydrocarbons thus obtained to the cracking operation to effect drastic cracking thereof and blending liquid so formed with said gasoline fractions first mentioned to form a final product having the desired boiling point range.



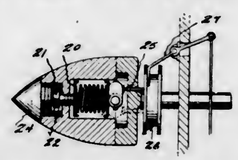
2,099,921

LINE TAP STICK WRENCH

Stephen P. Becker, Poughkeepsie, N. Y.

Application October 7, 1936, Serial No. 104,407
1 Claim. (Cl. 81—53)

In a stick-wrench of the class described, the combination of a head formed with an axial bore and mounted upon a stick, of a socket-member formed with a transverse slot in its outer end and rotatably mounted within the bore of said head, a driving lug located in the bottom of said axial bore, a driven lug formed on the bottom of said socket-member in the path of said driving lug and adapted to contact therewith to rotate said socket-member, and means for retaining said



socket-member either in a driving, neutral or driven position within the head, comprising radial holes formed in the wall of said head and a spring actuated ball latch mounted in said socket-member for selective engagement therewith.

2,099,922

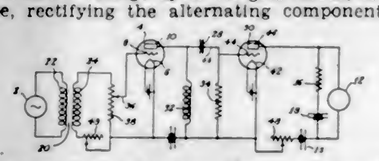
SCREW PROPELLER

Edward Lawrence Bellman, Rockford, Ill., assignor of one-half to Elmer W. Johnson, Rockford, Ill.

Application March 4, 1935, Serial No. 9,236
1 Claim. (Cl. 170—162)

A variable pitch propeller comprising a tapered conical hub having a front pocket and a rear chamber portion, a propeller shaft terminating with a flange for closing the hub chamber, means for securing said flange to the hub, the surfaces of said hub and flange being routed to form radial bearings, blade stems journaled in the bearings, cams carried by each stem disposed in the rear chamber portion, said cams being oppositely disposed relative to each other, a pressure plate mounted in said chamber portion engageable with the cams, a follower plate in said chamber portion, an expansion spring disposed between the plates, an adjusting screw extending through the hub pocket into the chamber and engageable with the follower plate, and a head cap in threaded union with the hub pocket serving as a closure therefor.

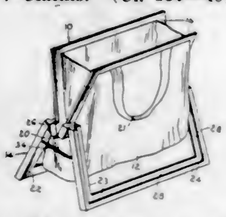
2,099,923



METHOD AND MEANS FOR MEASURING DYNAMIC CHARACTERISTICS

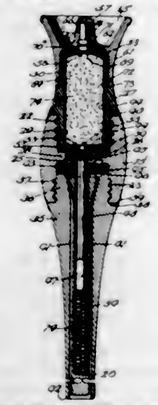
Edward Lindley Bowles, Wellesley Farms, Mass.

Original applications August 15, 1928, Serial Nos. 299,695 and 299,696. Divided and this application May 13, 1935, Serial No. 21,217
40 Claims. (Cl. 250—27)



1. In the process of determining the mutual conductance of a vacuum tube, the method which comprises impressing a predetermined alternat-

ing-current voltage upon the grid circuit of said tube, rectifying the alternating component re-



sulting in the plate circuit from said impressed voltage, and measuring the rectified current.

2,099,924
HANDBAG
Albert M. Bressler, New York, N. Y.
Application November 4, 1935, Serial No. 48,075
7 Claims. (Cl. 150—49)

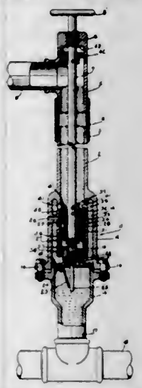
1. A convertible container comprising a main frame including two inverted U-shaped members pivotally connected together at their lower ends, a flexible bag secured to said members, said bag having an upper portion defined by separable upper edges secured to said frame members, side portions also attached to said members, and a closed-bottom lower portion extending below the pivoted ends of said members, and an auxiliary frame comprising two U-shaped members pivotally connected to said first mentioned frame members above the lower pivotally connected ends of the latter and adapted, in one position, to be disposed in substantially overlying relation thereto, and in another position, to be disposed at least partly below said main frame to constitute a support therefor.

2,099,925
SMOKING TUBE
Edmund Bruder, Chicago, Ill.
Application May 9, 1935, Serial No. 20,653
19 Claims. (Cl. 131—22)

3. A smoking tube of the character described comprising a body formed of separable sections and embodying a tobacco chamber, said chamber having an end wall provided with openings therethrough, and a freely rotatable element adjacent said wall, said element providing an abutment for the tobacco, said element being disposed within said chamber and provided with openings therethrough adapted to be moved into and out of register with the openings in said wall, as the element is rotated.

2,099,926
SMOKING TUBE
Edmund Bruder, Chicago, Ill.
Application June 3, 1936, Serial No. 83,239
11 Claims. (Cl. 131—22)

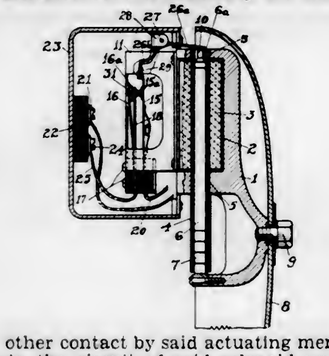
8. A smoking tube of the character described embodying axially alined sections telescoping one with the other, a circumferential channel in the periphery of one of said sections, grooves intersecting the said channel, the bottoms of said grooves being concaved, the walls of the grooves having opposed recesses communicating with the respective grooves, a resilient member seated in said channel and provided with arms seated in said grooves, formations on said arms seated in said recesses and normally projecting beyond the periphery of that section in which said grooves are located, a channel in the inner face of the other member to receive the said formations to yieldingly lock the sections against separation but for rotation one with respect to the other, and seats in the last recited channel for receiving said formations for yieldingly locking said sections against relative rotation.



10. A smoking tube of the character described embodying a plurality of axially alined sections separably secured together, a tobacco chamber in one section and having an end wall, an abutment in the tobacco chamber, means for urging the tobacco against the abutment, a stem on the abutment passing through an opening in said end wall, and a fastening element recessed in said stem and contacting the said wall for rotatably securing the abutment in position, a portion of said stem beyond said fastening means being angular in cross section, there being a recess in the other of said sections conforming in contour to and receiving the said angular portion of the stem, whereby upon rotation of the said other section with respect to the first said section said abutment will also be rotated in said tobacco chamber, and means for yieldingly locking said sections against separation.

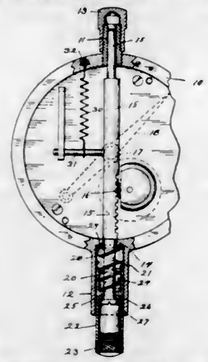
2,099,927
HAIRPIN
Edward D. Davis, Chicago, Ill., assignor to The Boye Needle Company, Chicago, Ill., a corporation of Illinois
Application May 20, 1936, Serial No. 80,899
Renewed July 28, 1937
11 Claims. (Cl. 132—50)

6. A hairpin comprising two legs connected by an integral bend, each of said legs having lateral notches formed in its side, the notches of one leg being aligned with the notches of the other leg.



2,099,928
HYDRANT
John Doppelhammer, Twin Lakes, Minn.
Application July 20, 1936, Serial No. 91,534
4 Claims. (Cl. 137—13)

1. A hydrant comprising a stand pipe provided at its lower end with a valve casing, a cylinder within the valve casing having its walls spaced from the wall of the casing to provide a chamber, said chamber having a valve opening in its lower portion for establishing communication between the chamber and a supply pipe, a valve for closing said valve opening, an operating rod for the valve having a threaded connection with the stand pipe, whereby rotation of the rod will seat or unseat the valve, a drain passage for the stand pipe, whereby its contents may be drained therefrom, when the valve is closed, and a piston device having an axial bore for receiving the operating rod and whereby the rod and piston device are adapted for free relative rotation, and means for preventing longitudinal movement of the piston device on the rod.



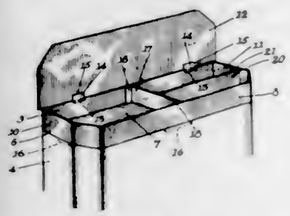
2,099,929
ELECTROMAGNETIC BELL
Joseph F. Ebert, Hollis, N. Y., assignor to Signal Engineering & Manufacturing Company, New York, N. Y., a corporation of Massachusetts
Application June 18, 1931, Serial No. 545,355
1 Claim. (Cl. 177—7)

In an electromagnetic bell, the combination with a magnetic frame carrying a solenoid, a magnetic plunger movable axially of the solenoid and a gong carried by said frame with its open rim extending in the path of movement of said plunger, of a circuit making and breaking device for controlling the energization of said solenoid comprising a pair of yieldable contacts normally in engagement to maintain the circuit of said solenoid, with one of said contacts initially deflected, a rigid stop interposed between said contacts out of engagement therewith, and an actuating member responsive to movement of, said plunger towards said gong for engaging the undeflected contact before said plunger strikes the gong and moving it away from the deflected contact, the initially deflected contact following the movement

of the other contact by said actuating member to maintain the circuit of said solenoid until said contact strikes said stop, after which further movement of the other contact by the actuating member serves to break the circuit of the solenoid just as said plunger strikes the gong, downward movement of said plunger following deenergization of the solenoid permitting re-engagement of said contacts, free of said stop, to re-energize said solenoid in advance of the arrival of said plunger in its lowermost position.

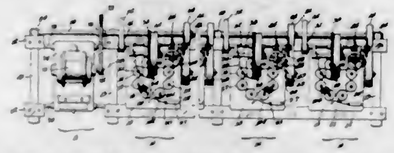
2,099,930
SHOCKPROOF ATTACHMENT FOR DIAL INDICATORS
Alfred H. Emery, Poughkeepsie, N. Y., assignor to Standard Gage Company, Inc., Poughkeepsie, N. Y., a corporation of New York
Application June 15, 1936, Serial No. 85,340
3 Claims. (Cl. 33—172)

1. A shock absorber for gear driven dial indicators having a tubular casing stem, a rack-plunger extending therein and means for normally retaining said plunger in a receded position, of a shock absorbing member slidably mounted within said tubular stem and upon said plunger, means for positively limiting the outward movement of said member with respect to the plunger and means for cushioning the inward movement



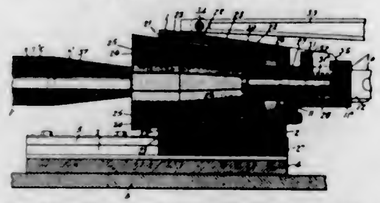
of said member with respect to the stem and without imparting movement to the plunger, but permitting its further inward movement.

2,099,931
TAMPON
Charles A. Fourness, Appleton, Wis., assignor to International Cellucotton Products Company, Chicago, Ill., a corporation of Delaware
Application April 15, 1935, Serial No. 16,321
8 Claims. (Cl. 128—285)



3. A tampon of the class described, comprising an elongated core formed of absorbent cellulosic material, an open mesh fabric encircling said core and strengthening the same against breakage from longitudinal tension, a covering of smooth fibrous material on said core and said fabric, and a moisture permeable sizing on said covering.

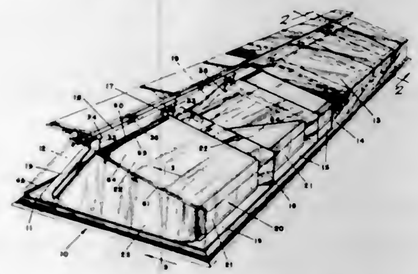
2,099,932
WATER TANK COVER
Carl C. Isaacson, Chicago, Ill., assignor to Louis J. Sladek, Chicago, Ill.
Application April 11, 1936, Serial No. 73,826
1 Claim. (Cl. 4—68)



A cover for closing the open top of a water tank for a water closet and comprising a bottom wall of substantially the same shape and size as the outside of the top of the water tank whereby said bottom wall may be rested on the top of the tank, side and end walls projecting upwardly from the bottom wall and providing a storage space in the cover, a plurality of partitions dividing the storage space into a plurality of compartments, the body of said partitions having foot portions at the ends thereof bent at an angle thereto, the foot portions on one of said partitions engageable with opposite side walls of said cover and the foot portions on the other of said partitions engageable one with an end wall and the other with said first mentioned partition, a lid hinged to the cover for closing the top of the compartments, and lugs on the bottom of the cover and spaced inwardly from the edges thereof to engage the inner sides of the walls of the tank to removably retain the cover in closing position on the top of the tank and whereby said cover walls are in substantial alignment with the tank walls.

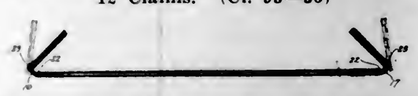
2,099,933
MULTISECTION BRAIDING MACHINE
Henry Janssen, Wyomissing, Pa., assignor to Textile Machine Works, Wyomissing, Pa., a corporation of Pennsylvania
Application April 6, 1935, Serial No. 15,048
7 Claims. (Cl. 96—19)

1. In a braiding machine having bobbin carriers in combination, a friction clutch having a driving member and a driven member, a shifting member for engaging and disengaging said driving and driven members, a spring for biasing said shifting member toward the engaging position, an operating lever member mounted to move freely away from said shifting member and to contact it when moved in the opposite direction, a second spring arranged to throw said operating member against said shifting member and having strength to overcome said first spring, latch means for holding said operating member against said second spring to cause the clutch to be operated by said first spring comprising a shaft having a nose with a surface in the form of a smooth curve arranged, when the clutch is operative, to seat in a similarly formed recess in said lever member and said lever having a rounded knob adapted and arranged, when the clutch is inoperative, to bear against said smooth surface to hold said lever against said second spring, a finger fixed to said shaft, a stop arranged to contact said finger to prevent said knob from passing off said curved surface, a handle fixed to said shaft for swinging said nose back into the recess in the lever, a cam finger fixed to said shaft, a part carried by a bobbin carrier of the machine and arranged to be held out of contact with said cam finger by a thread being wound and to drop into position to contact said cam finger upon breakage of said thread, said cam finger and thread released part arranged to act to throw said nose out of its socket in said lever member.



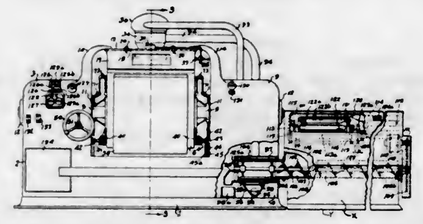
2,099,934
COMPRESSOR MECHANISM
William Abbott Joplin, Quincy, Mass., assignor to reinforced Paper Bottle Corporation, New York, N. Y., a corporation of Delaware
Application November 2, 1936, Serial No. 108,779
2 Claims. (Cl. 93—36.3)

1. In a paper bottle making machine, the combination with a mandrel on which bottle body



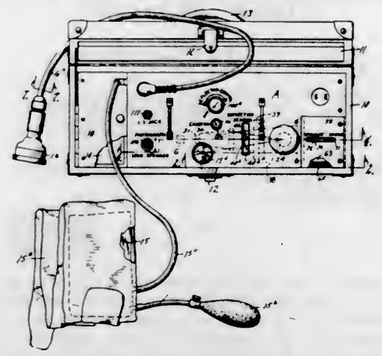
blanks are wound, of an alternately expandible and contractible pressure device comprising a conical shell slidably mounted in guide ways to move axially to and from a concentric position with the mandrel, a longitudinally grooved lining in the shell, pressure members slidable in the grooves and having cross grooves, a bracket at the small end of the shell, a spindle extending axially from the bracket into the shell, a spring pressed sleeve mounted on the spindle having the head located in the shell and fitting into the cross grooves of the pressure members, means for automatically locking the sleeve stationary during the initial return movement of the shell, and means for automatically releasing the sleeve at the end of the initial movement of the shell.

2,099,935
SHOWCASE AND SHAM CONSTRUCTION
Leo W. Kennedy, Detroit, Mich.
Application November 12, 1934, Serial No. 752,734
7 Claims. (Cl. 312—126)



1. In a show case construction having a floor section and having a top wall section, a sham having a front wall supported upon the floor section and having a top wall, means carried by the front wall for removably supporting the front side of the top wall of the sham in predetermined relationship to the top wall of the case and providing a fulcrum permitting the rear side of the top wall of the sham to be moved from a position adjacent the floor section to a position adjacent the top section of the case, and means for removably supporting the rear side of the top wall of the sham in the latter position thereof.

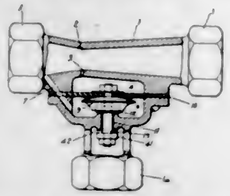
2,099,936
ART OF MANUFACTURING CONTAINERS OR PARTS THEREOF
Herbert M. Kieckhefer, Riverton, N. J., assignor, by mesne assignments, to Kieckhefer Container Company, Delair, N. J., a corporation of Delaware
Application June 8, 1936, Serial No. 84,148
12 Claims. (Cl. 93—36)



3. The method of manufacturing a container element comprising scoring a section of corrugated board along desired lines, dipping the corrugated board into melted impregnating material, folding portions of the element on said lines of scoring to a superimposed compact condition for shipment prior to solidification of the impregnating material, permitting the impregnating material to solidify to thereby hold the element in said compact condition, and subsequently bending said folded portions to approximately ninety degrees for assembly purposes.

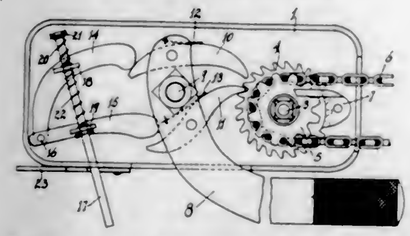
2,099,937
APPARATUS FOR DOUGH PREPARATION
Edward J. Lauterbur, Sidney, Ohio, assignor to Peerless Bread Machinery Corporation, Sidney, Ohio, a corporation of Ohio
Application April 9, 1934, Serial No. 719,685
5 Claims. (Cl. 107—4)

1. In mixing apparatus, a bowl mounted for tilting, mixing means in the bowl, a stationed cover for the bowl, closing the bowl when the bowl is tilted into position for mixing operation, water distributing means mounted on the stationed cover for discharge into the bowl, means stationed aside from the bowl and cover, for supply of water to said distributing means, a device mounted on the stationed cover for supplying a leavening ingredient to the contents of the bowl, and means for diverting a part of the water from said supply means to said device, introducing the water to said device with a disseminating action on the leavening ingredient therein.



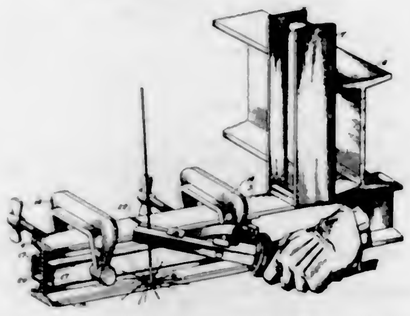
2,099,938
ELECTROSTETHOGRAPH
Marshall L. Lockhart, Des Moines, Iowa
Application February 5, 1934, Serial No. 709,797
11 Claims. (Cl. 128—2.05)

1. In an electrostethograph, a casing, an electric bulb therein, a galvanometer in the path of light therefrom, a film reception housing within said casing, said casing having a film compartment, a roll of film therein, a roller engaging said film for propelling it, means for rotating said roller, a controller for said means, a lens adjacent said roller and between the film and the galvanometer for concentrating light from the



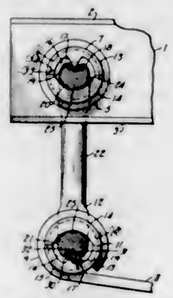
galvanometer on the film, said roller upon rotation causing said film to leave said film compartment, pass said lens and enter said film receiving housing, a microphone, an amplifier for amplifying the output of said microphone, said microphone being connected with the input of said amplifier and the output of said amplifier being connected with said galvanometer whereby vibrations picked up by the microphone are recorded on the film when said means is in operation as a result of operating said controller and a common source of current supply for said electric bulb, galvanometer and amplifier.

2,099,939
SAMPLING VALVE
George F. McDougall, Portland, Oreg.
Original application May 11, 1937, Serial No. 141,946. Divided and this application July 24, 1937, Serial No. 155,480
5 Claims. (Cl. 182—12)



1. A sampling valve for insertion in a water supply line comprising a body within which is a chamber, a flexible diaphragm forming a wall of said chamber, a Venturi tube in the chamber positioned to affect the diaphragm responsive to flow, a sampling mechanism associated with said body and double beat valve means for controlling said sampling mechanism that are controlled by said diaphragm.

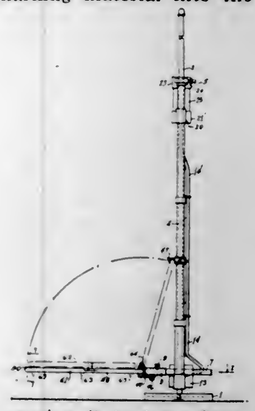
2,099,940
CHAIN JACK
Carl Orville Nelson, Long Beach, Calif.
Application November 5, 1935, Serial No. 48,317
5 Claims. (Cl. 254—171)



1. In a chain jack comprising a housing, a gear rack journaled in the housing, a sprocket rotatable with the gear rack, and a handle pivotally mounted in the housing adjacent the gear rack, a pair of dogs pivotally mounted on the handle, one end of said dogs being adapted to engage the gear rack and to rotate same as said handle is operated, a pair of fingers pivotally mounted in the housing, each one of said fingers being engageable with one of the dogs, and means selectively pressing said fingers against the dogs whereby the dogs are controlled to permit reverse movement of the gear rack and free movement of the gear rack.

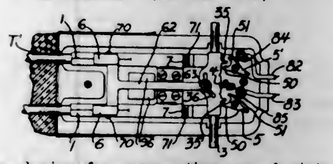
2,099,941
BUILDING CONSTRUCTION
Cecil C. Peck, Cleveland, Ohio
Application April 8, 1932, Serial No. 603,955
2 Claims. (Cl. 189—36)

1. A joint comprising a metallic member, two blocks welded to a surface thereof and shaped to fit a part of the surface of the end of a metallic rolled section, a metallic rolled section having an end positioned in contact with said blocks, and welding uniting the blocks and rolled section to the first mentioned piece.



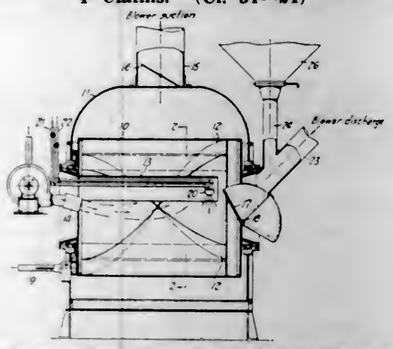
2,099,942
SPRING SHACKLE
Albert N. Porter, Tulsa, Okla., assignor to J. F. Darby, Tulsa, Okla.
Application October 5, 1936, Serial No. 103,958
2 Claims. (Cl. 267—54)

1. A spring shackle including a U-member having parallel shanks provided with V-shaped longitudinal grooves forming knife edge bearing seats, collars on the shanks, bushings loosely engaged over said shanks and having ribs provided with knife edge bearings for engaging in said seats, and means cooperating with the collars to retain the bushings.



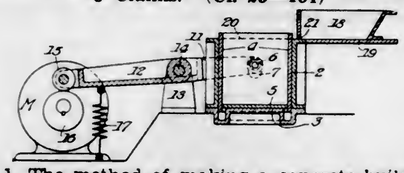
2,099,943
GARMENT MARKER
Abraham Robert Price, San Francisco, Calif.
Application September 2, 1936, Serial No. 99,115
5 Claims. (Cl. 33—9)

5. In a garment marker, a hollow ring having a section swingable into open position to permit a person to enter the ring, the free end of the section being closed and the end of the ring disposed adjacent to the free end also being closed, said ring and section having a plurality of small openings on their inner wall, and means for forcing a marking material into the ring and



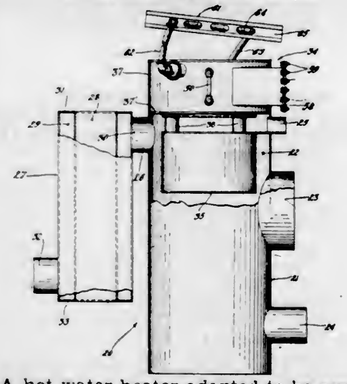
section for causing it to issue from the small openings.

2,099,944
ELECTRICAL CONNECTER
Ellsworth E. Saxton, Seattle, Wash.
Application March 25, 1933, Serial No. 662,675
Renewed April 20, 1937
19 Claims. (Cl. 200—50)



1. In a device for connecting an electric terminal to a source of current, means to engage and retain the terminal, switch means controlling the supply of current to the terminal when thus engaged, and switch-operating means operable only after the switch means is in the "off" position to move the terminal retaining means positively into disengaged position, thereby to free the terminal.

2,099,945
METHOD FOR THE TREATMENT OF COFFEE OR THE LIKE
Paul R. Simpson, San Mateo, Calif.
Application September 22, 1934, Serial No. 745,075
4 Claims. (Cl. 34—24)

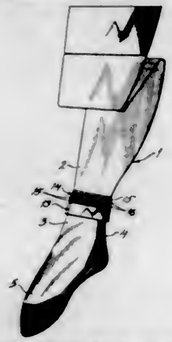


4. In a method of cooling coffee or like material after roasting, the improvement which comprises injecting into the material an atomized cooling liquid and simultaneously injecting into the material a volume of non-condensable gas in excess of the quantity required to atomize the liquid, said gas being injected under pressure and at a velocity greater than the normal circulation of air whereby to distribute the liquid or its vapor uniformly throughout the mass of material.

2,099,946
METHOD OF MAKING CONCRETE BUILDING BLOCKS
Francis J. Straub, New Kensington, Pa.
Application January 21, 1936, Serial No. 60,073
3 Claims. (Cl. 25—154)

1. The method of making a concrete building block consisting in compressing plastic aggregate in a mold by a tamping action and smoothing a face of the block during the tamping action by a trowelling action in a direction parallel to the direction of tamping.

2,099,947
WATER HEATING UNIT
Clarence Tompson, South Norwalk, Conn., and George Ray, Port Chester, N. Y., assignors to Ray Airconditioning Corporation, New York, N. Y., a corporation of Delaware
Application October 2, 1936, Serial No. 103,652
8 Claims. (Cl. 122—32)

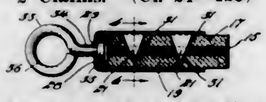


3. A hot water heater adapted to be associated with a hot air furnace having a fire chamber therein, said heater comprising a boiler; a steam head spaced upwardly from said boiler; a plate having a flat outer perimetric section, serving as a closure for the bottom of said steam head, adapted also to form a closure for the top of said furnace; a water tube connecting the upper portion of said boiler to the lower portion of said head; and a heating coil in said steam head having an inlet for connection to a water supply and an outlet for connection to a hot water outlet.

6. In a heating unit, the combination of a hot air furnace having a fire chamber therein; and a hot water heater forming a closure for the top of said chamber, said heater comprising a boiler

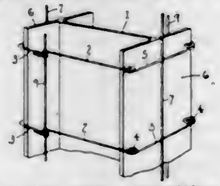
positioned in said chamber, having a fire tube therein, a steam head spaced upwardly from said boiler and having a flanged opening at one side thereof, a removable plate closing said opening, a water tube connecting said head and said boiler, and a heating coil in said steam head, having an inlet and an outlet portion extending through said removable plate for connection to a water supply and a hot water outlet respectively.

2,099,948
STOCKING
James Underwood, Easton, and Sterling Mack, Bangor, Pa., assignors to Julius Kayser & Company, Brooklyn, N. Y.
Application February 4, 1936, Serial No. 62,238
4 Claims. (Cl. 66—178)



1. A stocking comprising, in combination, a leg section, a boot connected to the leg section, and a cuff arranged at the point of juncture between said leg fabric and boot and having an elastic material incorporated therein whereby to draw the same close to the leg of the wearer.

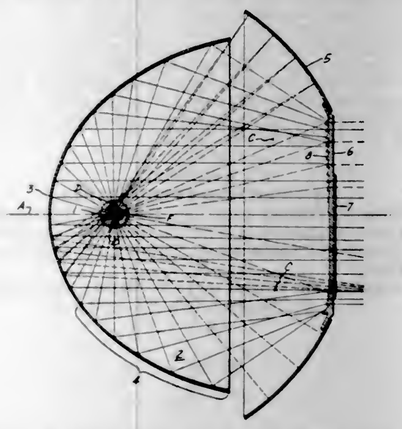
2,099,949
UNDERGARMENT SUPPORT
Ethel A. Wangenheim, San Francisco, Calif.
Application December 15, 1936, Serial No. 115,924
1 Claim. (Cl. 2—42)



The combination with a backless outergarment provided with shoulder portions and lingerie straps secured to the underside of the shoulder portions, and an undergarment, of straps having only one of their ends secured to only the front of the undergarment, the free ends of the last-named straps being disposed beneath the shoulder portions so as to be covered thereby, and passed through the lingerie straps, said undergarment supporting straps being bent back upon themselves, and cooperating means carried by the ends of the undergarment straps and at spaced distances from the ends for adjusting the effective lengths of the straps for causing them to connect the front of the undergarment to the lingerie straps, whereby the undergarment is supported without exposing any straps on the backless portion of the outergarment.

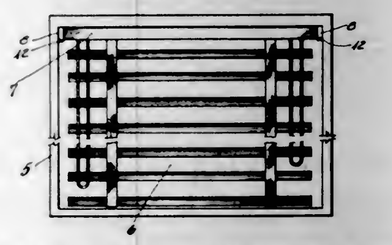
2,099,950
HARNESS CORD
Oscar N. Whitehead and Walter H. Toelle, Wallingford, Conn., assignors, by mesne assignments, to The Danielson Manufacturing Company, a corporation of Connecticut
Application January 11, 1936, Serial No. 58,681
2 Claims. (Cl. 24—123)

1. In a harness cord construction having a multi-strand flexible wire core sheathed in braided textile, a ferrule comprising a cylindrical wall and an end flange extending inwardly to form an end opening, a prong struck from the material of the side wall in a plane longitudinal to the core of the harness cord and of sufficient length to imbed in the strands of the wire core, and an attaching member having a shank extending through the opening and an enlarged head within the ferrule engaging said flange.



2,099,951
CONTINUOUS COLUMN CLIP
Dewey H. Bitney, Albion, Mich., assignor to Union Steel Products Company, Albion, Mich.
Application April 16, 1936, Serial No. 74,720
10 Claims. (Cl. 72—76)

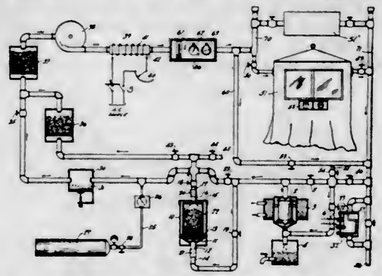
6. A column clip unit comprising a plurality of U-shaped transverse members having extending arms and spacing offsets at the bases of the arms thereof, and a longitudinal member secured to one arm of each transverse member, said member being secured to said arm at a point on the arm adjacent the outermost end thereof.



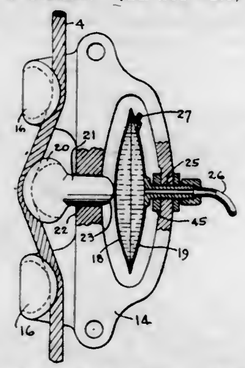
2,099,952
ILLUMINATING DEVICE
Thomas J. Brock, San Jose, Calif., assignor of thirty percent to Jennie L. Lean, San Jose, Calif.
Application December 4, 1935, Serial No. 52,801
2 Claims. (Cl. 240—41.3)

1. In an illuminating device, a source of light, reflecting means associated therewith comprising a parabolic surface having said source at its focus, a curved surface adjacent said parabolic surface generated by revolving an arc of a circle about the axis of the parabolic surface and having a radius intersecting said axis, and an annular reflector for directing light from said source against said parabolic surface at such an angle as to produce rays divergent from the para-axial beam produced by said parabolic surface from light reaching it directly from said source, said annular reflector being a toric surface the

radius of which does not intersect the axis of said para-axial beam.



2,099,953
VENETIAN BLIND SUPPORTING BRACKET
Fred J. Burns, Saginaw, Mich., assignor to The Columbia Mills, Inc., Saginaw, Mich., a corporation of New York
Application October 10, 1936, Serial No. 104,997
5 Claims. (Cl. 156—17)

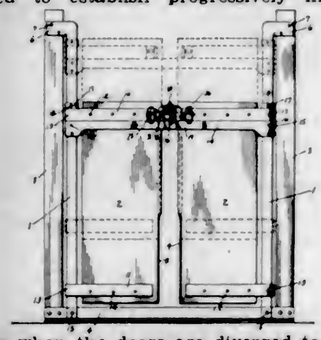


1. A bracket for removably holding a casing including a horizontally disposed shelf, a front wall hingedly secured to the bracket and adapted to be swung laterally to either open or closed position, and means for locking said member in its closed position.

2,099,954
APPARATUS AND PROCESS FOR TREATMENT OF RESPIRATORY DISEASES
Donald D. Cook, Chicago, Ill., assignor of one-fourth to Rodney G. Richardson, one-fourth to John W. Martin, and one-fourth to Muriel K. Fuller, all of Chicago, Ill.
Application March 4, 1935, Serial No. 9,261
Renewed September 4, 1937
15 Claims. (Cl. 128—191)

1. In combination, an air storage reservoir adapted to enclose the external breathing organs of a patient, a closed circulating system for withdrawing air from said reservoir and for returning the air, means in said system for regulating the amount of water vapor and carbon dioxide in the air, air cooling means included in the vapor regulating means, means for introducing oxygen into the system, and means for heating the air in the system before it is returned to said reservoir to compensate for the heat absorbed by said cooling means.

2,099,955
FLUID TRANSMISSION SCALE
Charles R. Edwards, Houston, Tex.
Original application October 2, 1922, Serial No. 591,755. Divided and this application September 8, 1934, Serial No. 743,290
2 Claims. (Cl. 265—1.6)



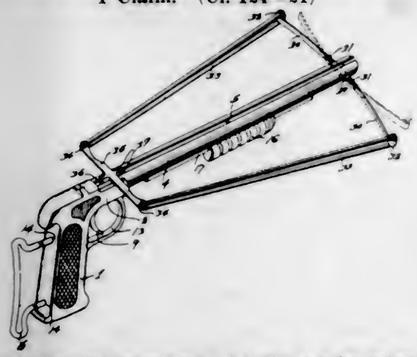
1. Hydraulic apparatus for revealing loads which comprises a main body, a fluid-holding cavity, a member capable of limited reciprocatory movement relative thereto, means for confining the fluid in said fluid-holding cavity between said main body and said member, said means including a flexible element yieldable to transverse pressure, means for so securing a flexible element relative thereto as to produce a predetermined deflection in said flexible element, operable means adapted to shift the relative position of said member so as to change the relative degree of said movement of said member for a given load on said flexible element, and means connected to said main body for revealing the pressure upon said fluid caused by a load on said flexible element.

2,099,956
HOG TRAP
John Henry Flatley, Little York, Ill., assignor of one-half to Edward G. Flatley, Rock Island, Ill.
Application September 18, 1935, Serial No. 41,018
8 Claims. (Cl. 119—98)

1. In a hog-trap, in combination, a support comprising spaced tubular uprights, a pair of doors, straps attached to the doors having turned ends which embrace said uprights forming elements of hinges, the uprights forming the other

elements of the hinges, a flexible member comprising corresponding lengths, the free end of each of which has a pivotal connection with a strap of each of the doors adapted for aligning and diverging the said doors, said member adapted to establish progressively increasing

tension when the doors are diverged to exert a pressure toward door alignment, means cooperating with the member for setting the doors in diverging positions, and means to lock the doors upon release of the setting means, whereby to prevent further divergence of the doors sufficient to release the trapped animal.



2,099,957

TOY AIRPLANE CATAPULT

Joseph W. Graham, Spokane, Wash.

Application March 14, 1936, Serial No. 68,849

1 Claim. (Cl. 124—21)

A catapult comprising a handle, a tube extending from said handle and formed with a longitudinally extending slot open at its front end, a cross bar extending transversely through said tube near the front end thereof, resilient strips carried by the cross bar and projecting from opposite ends thereof, a block slidable longitudinally in said tube and having a web along its upper portion projecting outwardly through said slot and formed with forks at its front end, a crosshead carried by the outer end of said web back of the forks and projecting from opposite sides of the tube, elastic bands connecting ends of said crosshead with outer ends of the resilient strips, a bumper projecting forwardly from said block within the tube for engaging the crossbar and limiting forward movement of the block when projected forwardly, the front end of the block above the bumper being stepped rearwardly to form a horizontal shoulder and above the shoulder being formed with a socket open at its front, an opening being formed in the under portion of said tube, a trigger pivoted to said handle and having a forwardly projecting arm carrying a bill projecting through the opening into the tube in position to engage the block under the bumper and hold the block in a set position with the elastic bands and resilient strips tensioned, and a spring engaging said trigger and yieldably resisting movement of the trigger in a direction to move the bill outwardly through the opening to a position for releasing the block.

2,099,958

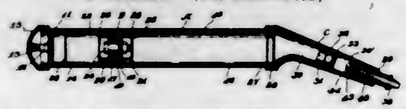
MOUNT FOR INDICATORS

Walter F. Herold and Leo Deutsch, Springfield, Ohio, assignors to The Chaney Manufacturing Company, Springfield, Ohio, a corporation of Ohio

Application March 6, 1936, Serial No. 67,512

2 Claims. (Cl. 73—151)

1. A mount for an indicator of the character described, comprising a saucer like housing having a perforated back wall, a spacer ledge intermediate the front and rear planes of such saucer shaped housing to receive an instrument panel, a concavo-convex indicator panel engaging thereon and forming intermediate such panel and the perforated rear wall of the housing an air chamber communicating with atmosphere through the perforations in the rear wall, an indicator means associated therewith, and a transparent concavo-convex dome of greater depth than the concavo-convex indicator panel telescopically engaged with the housing and enclosing the indicator panel and associated indicator means.



2,099,959

HAND AND AIR LOW PRESSURE GREASE GUN

August Johnson, Fargo, N. Dak., assignor to Jiffy Lubricator Company, Inc., Fargo, N. Dak., a corporation of North Dakota

Application April 21, 1934, Serial No. 721,806

9 Claims. (Cl. 221—47.4)

1. A hand air pressure grease gun including an air chamber, a grease chamber, a floating piston assembly between said chambers, a discharge nozzle including a check valve and movable closure plunger valve injecting tip having a valve head including a flexible removable seal thereon to seal said nozzle in one position, and spring means urging said nozzle into closed position.

2,099,960

WRENCH

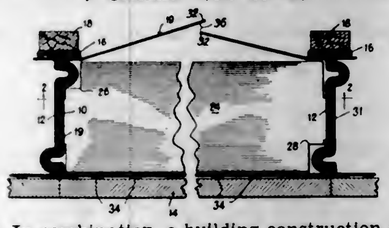
Raymond B. Johnson, Gladewater, Tex., assignor of three-fourths to John Kraker, Gladewater, Tex.

Application February 4, 1937, Serial No. 124,089

4 Claims. (Cl. 81—106)

1. In a wrench, a stationary jaw, a handle extending rearwardly from said jaw, a guide carried by the stationary jaw, a movable jaw in front of the stationary jaw having a shank extending rearwardly through said guide, a clutch yoke fitting loosely about said handle and having its upper end pivoted to the rear end of said shank, walls of the handle-receiving passage of said clutch yoke being formed with cam surfaces for gripping the handle when the upper end of the

clutch is forced forwardly, a spring carried by said stationary jaw and extending into said guide and engaging said shank, a trigger extending rearwardly from said clutch between the handle and the pivotal connection of the clutch and shank, and a spring extending longitudinally of said handle with its rear end anchored to the handle and its forward end connected with the clutch yoke under said trigger.



2,099,961

BUILDING CONSTRUCTION UNIT

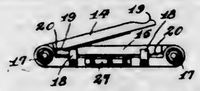
Robert W. McLaughlin, Jr., New York, N. Y., assignor to American Houses, Inc., New York, N. Y., a corporation of Delaware

Application May 22, 1937, Serial No. 144,198

7 Claims. (Cl. 20—4)

1. In combination, a building construction unit comprising a panel element, a plurality of spaced stud elements affixed thereto and extending therefrom, said stud elements forming with said panel element a trough-shaped assembly, the interior faces of said stud elements being irregularly shaped, a moisture-resistant lining positioned within said assembly and in close contact with the interior faces of said stud elements, insulation material within said lining, and means to provide a passage-way for ventilation between said panel element and said lining.

2,099,962



MINIATURE OFFSET PRESS

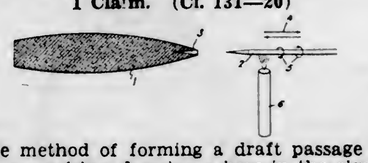
Manuel Mendivia, Washington, D. C.

Application June 6, 1936, Serial No. 84,001

6 Claims. (Cl. 101—130)

1. An offset printing press comprising a platen having a printing member swingably mounted upon one end thereof, a card-carrying member swingably mounted upon the other end of the platen, said members being adapted to be alter-

nately swung into operative position over the platen one above the other, the uppermost member having bearing contact with the other member.



2,099,963

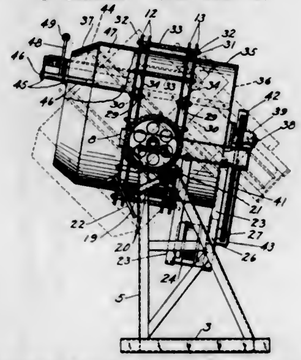
METHOD OF FORMING A DRAFT PASSAGE IN THE END OF A CIGAR

Herman Prager, Metairie, La.

Original application October 16, 1935, Serial No. 45,335. Divided and this application June 25, 1936, Serial No. 87,316

1 Claim. (Cl. 131—20)

The method of forming a draft passage in a cigar comprising, forming a bore in the cigar by piercing it with a displacing tool, communicating heat to the tobacco which forms the wall of said bore while the displacing tool is in place for destroying the elasticity of the tobacco, and oscillating the displacing tool while it is being entered and withdrawn to compact the contiguous tobacco, and to prevent winding of the tobacco upon the displacing tool or other adhesions between the tobacco and said tool which would tend to pull tobacco out into said bore or out of the cigar when the displacing tool is withdrawn.



2,099,964

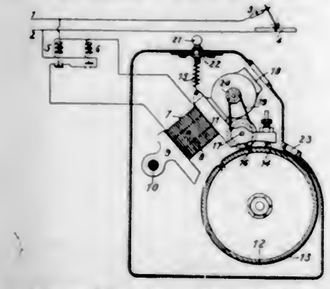
MIXING MACHINE

Earl J. Robbins, Seattle, Wash.

Application May 10, 1937, Serial No. 141,813

3 Claims. (Cl. 259—3)

1. A mixer comprising a supporting frame, a tilting frame supported thereby and including a pair of spaced rings and a U-shaped part each branch of which is secured to both of said rings, and each branch of the U-shaped part having a trunnion located between the rings and supported in a bearing on the main frame, one of the trunnions extending beyond the bearing and provided with a gear wheel, a worm and its shaft supported on the main frame and provided with a hand



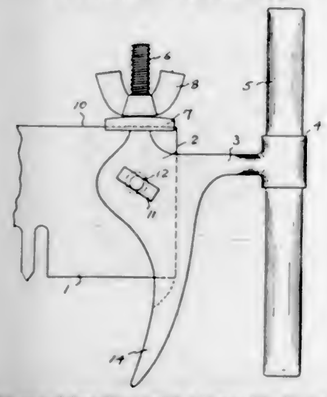
wheel, said worm engaging the gear, a mixing drum supported in the rings, said drum having a trunnion at its rear end supported by the U-frame, a motor carried by the tilting frame, and transmission mechanism between the motor and the trunnion at the rear end of the drum.

2,099,965

METHOD OF RECORDING THE WORK PERFORMED BY WELDERS

Robert Sarazin, Neuilly-sur-Seine, France

Application October 20, 1933, Serial No. 694,475
In France October 22, 1932
3 Claims. (Cl. 234—36.5)



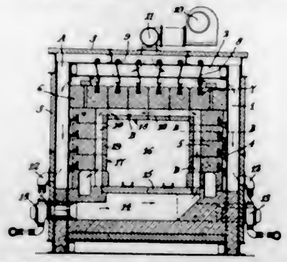
2. An elapsed time recorder comprising a working circuit, a normally open branch circuit connected across said working circuit, means responsive to a predetermined range of voltages across said working circuit for closing said branch circuit, and elapsed time exhibiting means operatively responsive to closure of said branch circuit.

2,099,966

CROSSCUT SAW HANDLE

Donald J. E. Smith, Vancouver, British Columbia, Canada, assignor to Joseph E. Whitten, Vancouver, British Columbia, Canada

Application December 15, 1936, Serial No. 116,021
2 Claims. (Cl. 145—111)



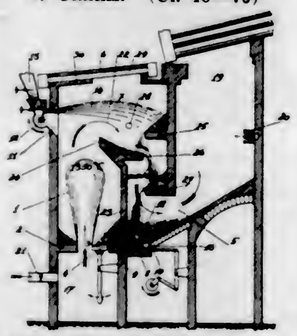
1. In combination with a saw blade having an eye in the ends thereof, a saw handle having a flat-sided body member and a vertical threaded stem integral therewith, a slot formed in said body member and in the lower portion of said threaded stem to permit said body member and lower portion of said stem to engage directly with said saw blade, an angularly disposed slot formed in and through said body member, a loosely mounted pin in said angular slot adapted to engage with the eye in said saw blade, a clamp washer having a shallow slot formed upon its lower side for engagement with the back edge of said saw blade, and means on said threaded stem to compress said clamp washer upon said saw blade after the eye of said saw blade has been engaged by the loosely mounted pin in said angular slot whereby said handle is brought into rigid engagement with said saw blade.

2,099,967

MUFFLE AND LIKE FURNACE

Henry Wilmot Spencer, Roehampton Lane, London, and Leonard Sherrington Davis, Bexley Heath, England

Application October 8, 1935, Serial No. 44,096
In Great Britain October 9, 1934
19 Claims. (Cl. 263—42)



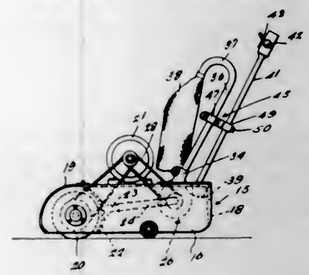
1. A muffle furnace construction comprising suspended arch refractory elements and muffle elements suspended from the arch elements to form a continuous muffle wall and affording passageways through which the products of combustion are intended to circulate.

2,099,968

GAS PRODUCER

Géza Szikla and Arthur Rozinek, Budapest, Hungary

Application April 11, 1934, Serial No. 720,138
In Germany April 18, 1933
10 Claims. (Cl. 48—76)



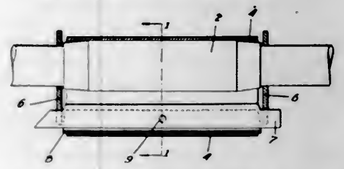
1. In a gas producer for gasifying and distilling combustible dust, especially coal dust, a gasifying chamber with a bottom opening for admission of air and removal of slags, a regulating means controlling said opening, a dust collecting chamber communicating with the gasifying chamber at its upper part and receiving hot gases and coke dust from said gasifying chamber, a coke dust return channel directly connecting the bottom portions of said chambers and ending at the bottom of the gasifying chamber whereby continuous circulation of coke dust through said gasifying chamber and said dust collecting chamber is permitted, and a device provided at the upper part of the gasifying chamber for introducing fresh coal dust in the shape of a screen across the cross sectional area of at least one of said chambers whereby the producer gases generated in said gasifying chamber are cooled to a temperature lower than the melting temperature of the slag.

2,099,969

FLOOR SURFACING MACHINE

George A. Berman, Lawrence, Mass., assignor of one-half to Oswald L. Rugaard, Lawrence, Mass.

Application May 14, 1937, Serial No. 142,710
6 Claims. (Cl. 51—176)



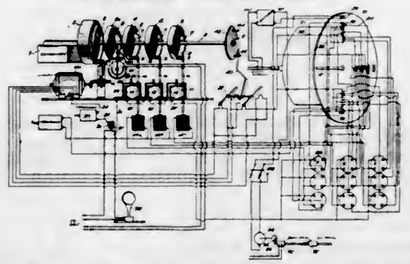
2. As a component part of a floor sanding machine of the class described, a mount in the form of a bodily applicable and detachable unit, said unit including an adapter plate having an apertured socket-equipped portion, an exhaust pipe mounted in said socket and adapted to support a dust collecting bag, a dust fan unit detachably bolted to the under side of said adapter plate and registerable with said apertured portion and socket, a pair of complemental handle rods, and means on said adapter plate for adjustably and detachably connecting corresponding lower ends of said rods to said adapter plate.

2,099,970

GUIDING OF BELTS IN HIGH-DRAFT MECHANISMS

Fernando Casablancas, Lausanne, Switzerland

Application September 8, 1936, Serial No. 99,823
In Spain September 20, 1935
8 Claims. (Cl. 19—131)



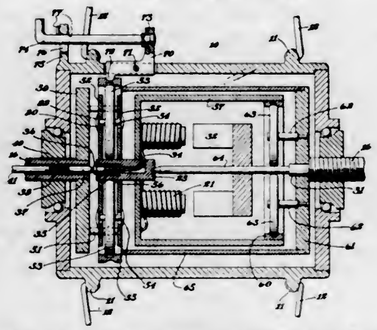
1. In a high-draft mechanism for textile fibres the combination of endless belts, cylinders for actuating said belts, a guiding frame, lateral plates in the said frame, guide rods introduced into the front curve of the belts, and belt engaging rods articulated to said guide rods and adapted to oscillate with respect to their normal position in order to compensate for the stretching and displacement to which the belts might be subjected.

2,099,971

AUTOMATIC CONTROLLER FOR A RADIO RECEIVING SET

Jay F. Dailey, Hillside, N. J., assignor of one-fourth to Raymond Schroeder, Essex County, N. J., and one-half to Martin T. Fisher and Aksel M. Pedersen

Application May 8, 1929, Serial No. 361,416
17 Claims. (Cl. 250—20)



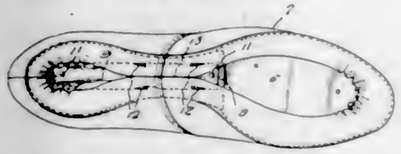
10. A device for controlling the volume of sound from a radio receiving set which is adapted to receive signals of varying strength, comprising tuning means, a rheostat, for controlling the filament current of a vacuum tube, and cam means simultaneously movable with the tuning means, for controlling the rheostat, the curvatures of the cam being shaped to control the volume of sound received from particular broadcasting stations.

2,099,972

ELECTRIC GENERATOR

Sten Gunnar Dalén and Emil Einar Wilhelm Anderson, Stockholm, Sweden, assignors to Aga-Baltic Radio Aktiebolag, Stockholm, Sweden, a corporation of Sweden

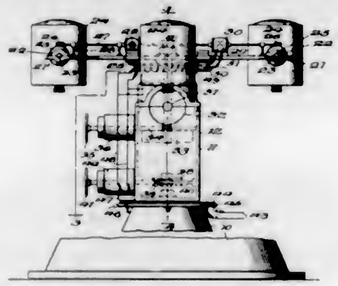
Application July 22, 1935, Serial No. 32,474
In Sweden July 29, 1934
14 Claims. (Cl. 171—209)



1. An electric generator including a first rotatable member, a second rotatable member mounted within and concentric with said first member, a plurality of rotatably mounted wheels internally engaging said first member and externally engaging said second member for transmitting rotary motion between said members, said first member being resilient so as to frictionally engage said wheel, at least one of said wheels being mounted on a floating shaft to permit radial displacement of the wheel, an armature element mounted on one of said members, and a field element mounted on the other of said members in operative relation with said armature element.

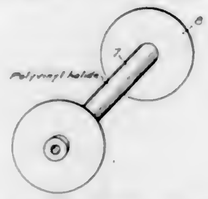
2,099,973
LIFESAVING AND SWIMMING PROPELLING DEVICE
Louis Marie de Corlieu, Saint Mande, France
Application September 21, 1933, Serial No. 690,474
In France April 6, 1933
5 Claims. (Cl. 9—21)

1. Swimming equipment, comprising a paddle adapted to be mounted on the foot having a substantially flat, flexible and resilient, non-pivoted portion extending for a substantial distance forwardly beyond the toes and arranged tangential to the plane of the toes and so situated with respect to the foot as to lie substantially in alignment with the leg when the foot is extended in line with the leg in the position for performing the crawl stroke, means mounted on said paddle accurately fitting the foot and securing the paddle thereto.



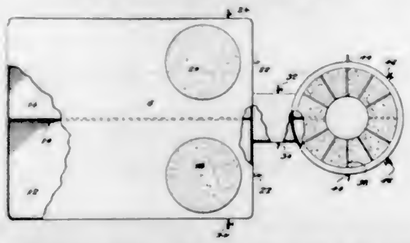
2,099,974
PROCESS OF MAKING SHOES
William I. Duga and Alfred H. McNalley, San Francisco, Calif.; said McNalley assignor to said Duga
Application July 30, 1936, Serial No. 93,506
1 Claim. (Cl. 12—142)

The improvement in the process of making shoes which consists in supplying an insole having attached thereto a metal shank stiffener having clinching prongs struck downwardly from the longitudinal edges thereof, engaging the margins of an upper along the shank portion of the shoe with said prongs and overlapping said margins at said portion upon the forward portion of the shank stiffener, clinching said prongs upon the margins of the upper, and cutting away the excess material of the lasting allowance of the upper along the shank portion of the shoe so that the edges of said margins of the upper are disposed in non-overlapping substantially abutting relation at the shank portion of the shoe.



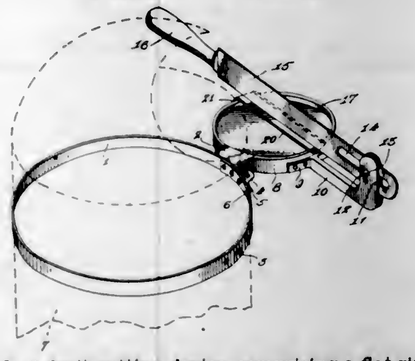
2,099,975
LIGHT PROJECTING APPARATUS
William C. Hackman, Baltimore, Md.
Application June 26, 1935, Serial No. 28,544
11 Claims. (Cl. 240—49)

1. In light projecting apparatus, the combination comprising a plurality of electric light beam projectors, means for pivotally supporting said projectors in symmetrical relation to a single axis, said supporting means including electric means for simultaneously tilting each said projector in a plane including said projector and said axis, electric means for rotating said supporting means, whereby a unified light beam is produced by said projectors, means for tilting said supporting means in a vertical plane to vary the elevation of said light beam, means to rotate as a unit all of said previously recited structure, whereby the azimuth of said light beam may be varied,



and electric supply means for feeding electrical energy to said electric light beam projectors and to said electric means.

2,099,976
MANUFACTURE OF SHAPED ARTICLES
Max Hagedorn, Dessau in Anhalt, Germany, assignor to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
Application July 15, 1933, Serial No. 680,654
In Germany July 16, 1932
7 Claims. (Cl. 95—1)



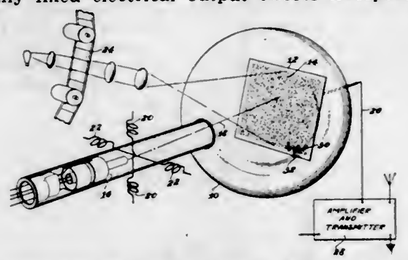
1. A slide for light sensitive photographic material which comprises a polymerized vinyl chloride containing about 60 to 65 per cent of chlorine.

2,099,977
ADJUSTABLE BODY SUPPORT
Owen D. Harris, Petersburg, Ind.
Application July 23, 1936, Serial No. 92,185
3 Claims. (Cl. 27—23)

1. A body support of the class described comprising a shoulder and back supporting section including a pair of longitudinally extending cells, means for controlling the inflation and deflation of said cells individually, a connector secured to said back supporting section, a cellular head rest secured to connector, and means for controlling the inflation and deflation of the head rest.

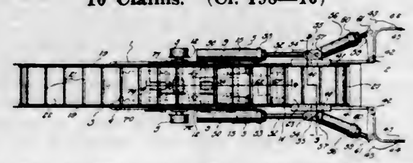
2,099,978
FRUIT CUTTING DEVICE
Everett I. Hess, Newport, R. I.
Refiled for abandoned application Serial No. 510,036, January 20, 1931. This application February 18, 1937, Serial No. 126,516. Renewed October 11, 1937
5 Claims. (Cl. 146—72)

2. A fruit cutting device, comprising a flat ring, a slidable knife pivotally supported by the ring and swingable over the ring, a pan having an open beaded edge to rest on the top of the ring, and a fruit support and cutting gage comprising a member having parallel arms and having one of its ends hingedly secured to the bead and its other end formed with a catch to engage the bead of the pan to hold the gage thereagainst and said gage having its parallel arms arranged centrally with respect to the cutting edge of the knife.



2,099,979
BUTTON
Ralph C. Bangs, Providence, R. I., assignor to Coro-Gram, Inc., New York, N. Y., a corporation of New York
Application December 7, 1936, Serial No. 114,563
2 Claims. (Cl. 24—113)

1. A composite button comprising a base member which has an end-face and an inwardly extending lateral skirt, and a face member also having an end-face and an inwardly extending tapered lateral skirt, the inner end of the skirt of the face member being open and of smaller diameter than the end-face of the base member, said face member enclosing said base member and being generally cup-shaped and having its skirt provided with pairs of slits which define intermediate resilient tongues, said tongues being sufficiently deep and resilient to permit the inner end of the skirt of the face member to be forced over the end-face of the base member.

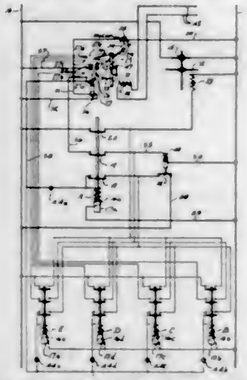


2,099,980
METHOD AND APPARATUS FOR TELEVISION TRANSMISSION
Harley A. Iams, Collingswood, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application March 30, 1933, Serial No. 663,450
7 Claims. (Cl. 178—6)

1. In a television transmission system of the cathode ray type, a cathode ray optical image translating tube, means for projecting an optical image thereupon for transmission, said tube being provided with a source of cathode rays and a photosensitive light translating target of which predetermined areas within the picture signal developing section of said target have different electrical characteristics for producing substantially fixed electrical output effects irrespective

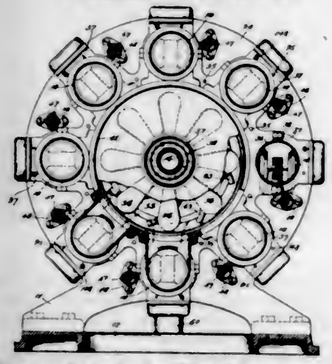
of conditions of illumination of the entire screen, means for causing the cathode ray to scan the target, and means for producing from the scanning a series of image signals representing both the optical image and a modification thereof as determined by the scanning of the areas of different electrical properties from the projected optical image upon the light translating target area.

2,099,981
MATERIAL LOADING APPARATUS
Joseph F. Joy, Claremont, N. H., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application July 1, 1935, Serial No. 29,309
10 Claims. (Cl. 198—10)



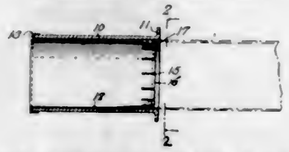
1. In a loading apparatus, a portable base, conveying means, and material loading mechanism on said base for moving the material to be loaded onto said conveying means including supports mounted for rectilinear movement at the opposite sides of said conveying means, cooperating claw-like digging and gathering elements pivotally mounted on the forward extremities of said supports to swing horizontally with respect thereto about upstanding axes, means for moving said supports forwardly rectilinearly relative to said conveying means to move bodily said gathering elements into gathering relation with the material to be loaded, means for thereafter swinging said gathering elements inwardly to dig into and grasp a portion of the material, and means for thereafter moving said supports rectilinearly rearwardly relative to said conveying means to move said gathering elements bodily rearwardly into a position to discharge the material grasped thereby onto said conveying means.

2,099,982
VARIABLE IMPULSE TRANSMITTER
Werner Koenig, Luzern, Switzerland, assignor to Landis & Gyr, A.-G., Zug, Switzerland, a corporation of Switzerland
Application January 8, 1935, Serial No. 829
In Switzerland January 13, 1934
2 Claims. (Cl. 177—380)



1. An impulse transmitter including in combination a rotary multiple contact selector switch

having a normal position, an impulse generator and electromagnetic means for driving it, means for advancing the rotary element of the switch proportionally to the number of and by said impulses, means for resetting the switch to its normal position after any movement thereof from its normal position, a plurality of relays each having energizing windings and contacts controlled thereby, a circuit for said electro-magnetic driving means completed by certain of the contacts of any relay when energized, means for initially energizing the winding of each relay, a holding circuit for each relay closed by certain other of



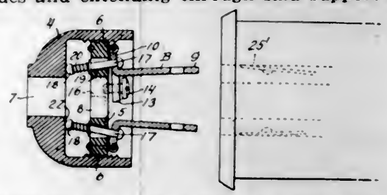
its contacts to maintain the relay energized independent of said initial energizing means, electro-magnetic means common to said holding circuits of the relays for opening them, a plurality of circuits for said second electro-magnetic means each respectively including in series certain other contacts of said relays and corresponding contacts of the selector switch in its different positions whereby when the selector switch reaches the contact corresponding to the operated relay, the electro-magnetic means will open its holding circuit and thereby stop the operation of the generator.

2,099,983
INTERNAL COMBUSTION ENGINE
Simon Lake, Milford, Conn.
Application September 18, 1929, Serial No. 393,356
Renewed April 26, 1937
27 Claims. (Cl. 123—41)

1. In a multi-cylinder Diesel-type engine, a fuel injector for each cylinder including a chamber; a valve for closing said chamber; mechanism for automatically opening and closing said valve; means for maintaining fuel in said chamber under pressure and injecting the fuel into the cylinder when said valve is opened, said means including a plunger and a stop device on the plunger for determining its length of stroke in injecting direction; and means common to all of said injectors and comprising cooperating stops.

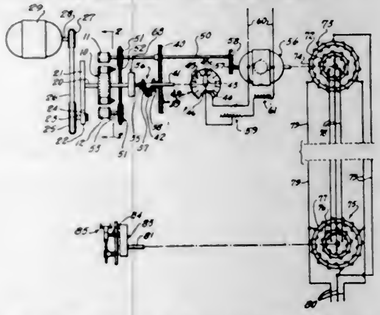
2,099,984
PIPE CONNECTER
Gustaf Lundquist, Hawthorne, Wis.
Application February 9, 1937, Serial No. 124,801
3 Claims. (Cl. 285—185)

1. A pipe coupling comprising a non-metallic tubular member, an inner metallic tubular member extending throughout the length of said outer member secured therein and having a flanged inner end engaging the inner peripheral edge thereof, said inner member having a plurality of longitudinal outwardly extending resilient tongues lying within said outer member and adapted to interiorly engage a pipe thrust between said inner and outer members.



2,099,985
STRAND WINDING MACHINE
William E. Mahoney, Pawtucket, R. I., assignor to Premier Thread Company, a corporation of Rhode Island
Application July 30, 1936, Serial No. 93,403
11 Claims. (Cl. 242—43)

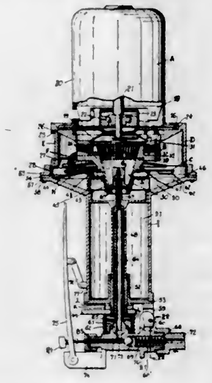
1. A strand winding machine for a tapered base bobbin consisting of a revolvable mandrel, a strand guide to present the strand to be wound, means relatively to traverse said strand guide along the mandrel in the winding of successive layers upon a bobbin, means for moving the strand mass axially of the mandrel as wound, means engaging the tapered bobbin base for retarding said axial movement, and means operative in response to the building of the strand mass to incrementally relieve said retarding means whereby the bobbin and mass thereon axially moves along the mandrel.



2,099,986
ELECTRIC ATTACHMENT PLUG
Alfred W. Muller, New York, N. Y.
Application June 17, 1936, Serial No. 85,665
10 Claims. (Cl. 173—361)

8. In an attachment plug, a pair of spaced elongated contact blades, a blade support, means pivotally connecting said blades to said support adjacent one end of said blades, a cap having a base and a flange at least partially enclosing, and threadedly connected to said blade support to render the cap movable with respect to said blade support, operating means connected to said blades and extending through said support into

engagement with the internal surface of the base of said cap for moving said blades about said pivotal connecting means upon movement of said cap relative to said support, and spring means interposed between said support and said operating means for maintaining said operating means in engagement with the base of said cap.

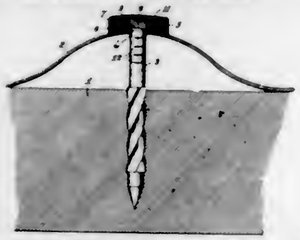


2,099,987
FILM DRIVING SYSTEM
Sidney A. Murdock, Los Angeles, Calif., assignor, by mesne assignments, to Robert Gumbiner, Los Angeles, Calif.
Application January 2, 1935, Serial No. 94
9 Claims. (Cl. 271—2.3)

9. In combination, a film feeding drum adapted to move a sound record film past a sound wave translation member, a constant speed electric motor drivingly coupled to said film feeding drum, another film feeding device, an electric motor for operating said last mentioned film feeding device, and automatic speed control means for the last mentioned motor including a driven member moving in consonance with the uniform rotation of the film feeding drum and by virtue of power received therefrom, and an electrical speed control circuit for said motor controllable by said driven member to maintain said motor during normal running at a speed synchronous with the speed of the film feeding drum.

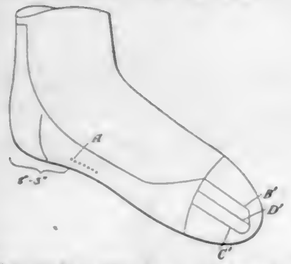
2,099,988
SPRAYING DEVICE
Edward O. Norris, Port Chester, N. Y., assignor to The Norris Painting Machinery Corporation, Inc., New York, N. Y., a corporation of New York
Application April 16, 1931, Serial No. 530,551
Renewed May 27, 1937
17 Claims. (Cl. 299—63)

1. In a spraying device, a casing having an opening at one side of the device, means providing a chamber within the casing, a revolvable apertured distributor in the casing to which the material is fed and from which it is discharged through the apertures, said opening being in the line of discharge of the distributor, means associated with the casing by which the used mate-



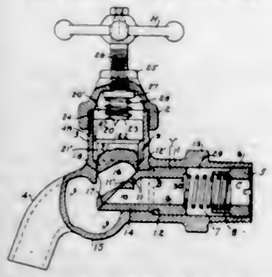
rial is delivered through the casing opening in a spray and the unused material is deflected to the chamber, means within the casing to deliver the unused material from the chamber back into the distributor, a valve controlling the said delivery, and means including an element outside of said casing by which said valve is operated.

2,099,989
TRIM PANEL CONSTRUCTION
William C. Osborn, Detroit, Mich., assignor to The Murray Corporation of America, a corporation of Delaware
Application May 11, 1936, Serial No. 78,985
6 Claims. (Cl. 154—45.9)



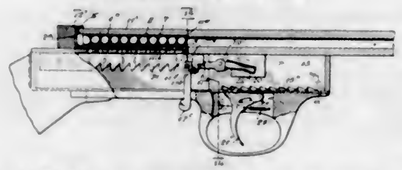
1. A trim panel construction including, in combination, a relatively stiff cardboard backing sheet, a layer of loosely felted non-woven padding material adhesively secured to said backing sheet, said padding material having a marginal configuration substantially congruent to said backing sheet, said padding being formed to provide an aperture therein, spaced inwardly from the marginal edge thereof, and a section of fabric finish material covering said padded backing sheet, the marginal edges of said fabric finish material being secured to said backing sheet, said fabric finish material being further secured to said backing sheet in said aperture.

2,099,990
WEATHERPROOFING FASTENER
Heyman Rosenberg, New York, N. Y.
Application October 23, 1934, Serial No. 749,642
11 Claims. (Cl. 85—28)



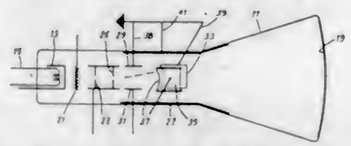
1. In fasteners, the combination, with a body, of a head frame therefor having means for receiving a soft metal coating, said head frame having an abruptly shouldered, inwardly facing, metal imprisoning portion about and above the upper surface of the main portion of the head frame to resist spreading or loosening of the upper coating of the head frame under hammer blows, and a soft metal coating covering said head frame.

2,099,991
FULL-FASHIONED HOSIERY
Joseph C. J. Strahan, New York, N. Y.
Application March 8, 1935, Serial No. 10,063
5 Claims. (Cl. 66—187)



1. A diamond point toe construction for a stocking comprising a diamond point area of transferred loops flanked on both sides by areas of untransferred loops.

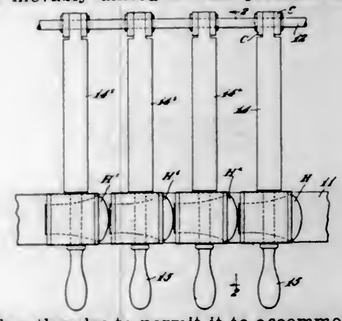
2,099,992
VALVE
Nathaniel Sutcliffe, Newark, N. J.
Application May 21, 1936, Serial No. 80,924
12 Claims. (Cl. 251—20)



1. A valve comprising a body portion having an inlet port and an outlet port, two movable, contacting, ported valve members therein mounted at angles to each other and normally positioned so as to close communication between the ports therein, said valve members at their contacting points having angled faces comprising overlapping webs, said webs having ports therein and means for causing said members to move on their contacting faces to mutually open communication between all of said ports.

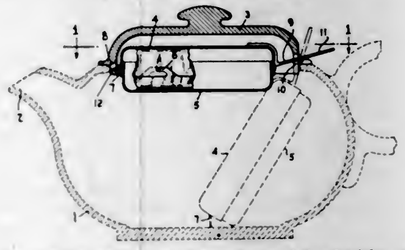
2,099,993
FIREARM
Gustav Tauschek, New York, N. Y.
Application November 23, 1933, Serial No. 699,306
In Austria September 15, 1933
19 Claims. (Cl. 42—4)

1. A firearm comprising a stock, a recoil barrel movable lengthwise of said stock, means holding a plurality of projectiles in tandem on the longitudinal axis of the barrel, firing mechanism, and means, operated by the longitudinal movement of the barrel relatively to the stock, for establishing successively an operative relation between said firing mechanism and the several projectiles.



2,099,994
ELECTRON TUBE
James T. Wilson, Arlington, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application May 12, 1936, Serial No. 79,341
7 Claims. (Cl. 250—27.5)

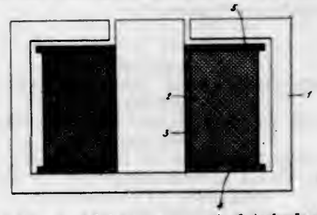
1. In an electron tube, means to develop an electron beam, a plurality of electrodes to deflect said electron beam, said electrodes each having one edge portion thereof concavely curved with respect to the origin of the produced electron beam, and an inwardly extending flange attached to the opposite edges of one of said electrodes, said flange extending parallel to the direction of beam motion.



2,099,995
SHOE MACHINE
Albert F. Bancroft, West Newton, Mass., assignor to Bancroft-Walker Company, Waltham, Mass., a corporation of Massachusetts
Application December 29, 1936, Serial No. 118,075
8 Claims. (Cl. 12—49.1)

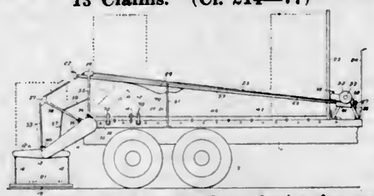
1. Apparatus of the class described comprising a support for a shoe heel, said support having a heel-engaging surface approximating the shape of the breast of the heel, and a movable pressure-applying member having a heel-engaging pad engageable with the rear surface of a heel disposed with its breast in contact with the heel-engaging surface of the support, said pad being movably united to said pressure-applying

member thereby to permit it to accommodate itself to the contour of the heel.



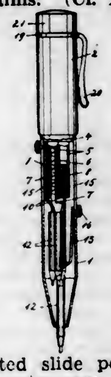
2,099,996
TEAPOT
Leopold Beling, deceased, late of Long Beach, N. Y., by Christopher C. Beling, executor, Newark, N. J.
Application November 3, 1936, Serial No. 108,941
1 Claim. (Cl. 53—3)

In combination, a teapot, a detachable concave cover for said teapot having an opening, a perforated cartridge for holding the tea and substantially conforming to the configuration of the cover, a flange depending from the cover within the teapot and having a perforation diametrically opposite said opening, a lip protruding from the cartridge and projecting through said perforation, and a handle fastened to the cartridge and projecting through the opening to the outside of the cover and by means of which the said lip may be moved in and out of said perforation and the cartridge submerged in the water in the teapot or removed from the water and held within the cavity of said cover.



2,099,997
COIL BODY FOR FIELD COILS OF ELECTRODYNAMIC LOUDSPEAKERS
Heinrich Benecke, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany
Application July 31, 1934, Serial No. 737,712
In Germany July 26, 1933
1 Claim. (Cl. 179—117)

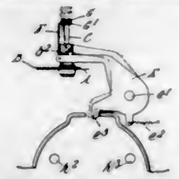
A magnet system for an electrodynamic loudspeaker comprising a central pole piece, an air gap, a tubular member of metal adapted to fit snugly about said central pole piece, disposed on said central pole piece, said tubular member being coated with a lacquer having a quartz filling, flanges at opposite ends of said tubular member, the flange at the end of said tubular member adjacent said air gap being of nonmagnetic, impregnated fibrous material having a high coefficient of heat transfer, the flange at the other end being of metal, and a field wind-



ing applied to said lacquer-coated tubular member between said flanges, said lacquer-coated tubular member providing good electrical insulation and also good heat conduction for the field winding.

2,099,998
LOADING AND UNLOADING DEVICE FOR TRUCKS OR OTHER VEHICLES
Robert H. Berg, San Francisco, Calif.
Application February 17, 1937, Serial No. 126,187
13 Claims. (Cl. 214—77)

1. A loading and unloading device for vehicles comprising a pair of arms pivotally secured to the rear corners of a truck, sprockets placed at the pivotal axis of the arms and being held against rotation, stub shafts rotatably carried by the free ends of the arms, sprockets keyed to the shafts, chains connecting the sprockets in each arm together, and a load lifting yoke rigidly connected to each stub shaft, said yokes being held in the same angular position with respect to the vehicles by the chains and sprockets during the entire swinging of the arms.



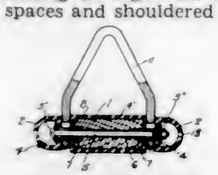
2,099,999
SLIDE PENCIL
Christian Bossert, Pforzheim, Germany
Application February 18, 1936, Serial No. 64,432
In Germany February 25, 1935
7 Claims. (Cl. 120—14)

1. A polypointed slide pencil comprising in combination, an outer case, a plurality of inner

cases, a lead holder in and extending through the bottom of each inner case, a shaft and a piston associated with each holder and a coil spring inserted between each piston and the bottom of the inner case.

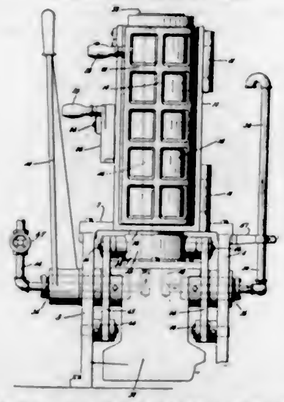
2,100,000
CINEMATOGRAPHIC CAMERA AND PROJECTOR
Charles Edward Hillery-Collings, Mitcham, England
Application November 16, 1935, Serial No. 50,069
In Great Britain November 16, 1934
2 Claims. (Cl. 88—19.3)

1. A cinematographic instrument capable of use as a camera and as a projector, having a rotary shutter comprising two members mounted on concentric sleeves and normally overlapping each other but adapted to be spaced apart by a movement of relative rotation of said sleeves, means to effect such relative rotation including a pivoted lever, a detachable lamp housing provided with means to actuate said lever on the insertion of said housing into operative position in the instrument, cooperating means on said lamp housing and said instrument serving to position said housing in said instrument, and means to return the shutter members to their normal positions upon the withdrawal of said housing.



2,100,001
LEADER BRACKET
Louis C. Eberle, Roselle Park, N. J., assignor of one-half to Gustave Eberle, Roselle Park, N. J.
Application November 20, 1936, Serial No. 111,919
2 Claims. (Cl. 248—74)

1. A leader bracket, including a metal strap adapted to partially encircle a leader, and inwardly projecting corrugated flanges at the edges of the strap adapted to bitingly engage the leader.



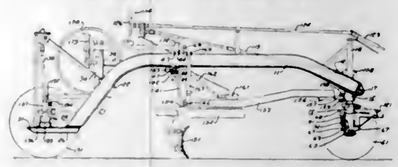
2,100,002
SWING SEAT
Walter B. Evans, Fred C. Garratt, Jr., and Edwin F. Hoppes, Springfield, Ohio, assignors to The Everwear Manufacturing Company, Springfield, Ohio, a corporation of Ohio
Application July 9, 1936, Serial No. 89,806
4 Claims. (Cl. 155—58)

1. In a swing seat, a core having reduced ends, protecting cushions embracing said reduced ends, protecting cushions secured to the side edges of said core, a bolt at each end of said core extending through both side cushions and an end cushion and also through the core, said reduced ends of the core providing spaces between the side cushions and the end cushions, bearing sleeves on said bolts extending through said cushions and through said spaces and shouldered against said

core, and a clevis at each end having eyes pivotally mounted on said sleeves to permit the clevis to be swung from one face of the seat to the other and the seat reversed.

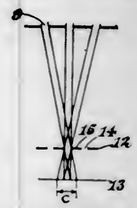
2,100,003
STEREOTYPE PLATE CASTING MACHINE
Frank A. Foster, Maywood, Ill., assignor to The Goss Printing Press Company, Chicago, Ill., a corporation of Illinois
Application April 10, 1935, Serial No. 15,508
1 Claim. (Cl. 22—4)

A machine for casting tubular stereotype plates including in combination a frame, an openable and closable cover, a hollow, water-cooled, pivotally mounted core movable between casting and delivery positions, said pivotal mounting for the core comprising hollow trunnions journaled in the frame, a water pipe within the core connected to one of the hollow trunnions acting as a water inlet, and a water outlet at the bottom of the hollow core communicating with the other hollow trunnion, and a stationary exterior pipe, receiving the discharged water from the trunnions, said pipe having its discharge end at substantially the level of the top of the core when in casting position.



2,100,004
BINDING MACHINE
Harold F. Gibling, Pawtucket, R. I., assignor to Manville Jenckes Corporation, Manville, R. I., a corporation of Delaware
Application June 14, 1934, Serial No. 730,559
11 Claims. (Cl. 100—31)

1. A machine for applying bindings to hollow thread packages comprising knot tying mecha-

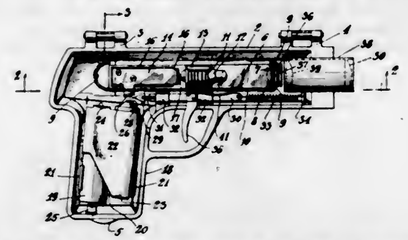


nism adapted for positioning and knotting a binding around the wall of the package, a carrier for feeding packages successively to said knot tying mechanism, and means for varying the angular position of each package on the carrier to position said package with relation to the knot tying mechanism to receive a plurality of bindings at spaced intervals around the wall of the package.

2,100,005
ROAD MACHINE
Carl A. Gustafson, Peoria, Ill., assignor to Caterpillar Tractor Co., San Leandro, Calif., a corporation of California
Application February 5, 1934, Serial No. 709,831
1 Claim. (Cl. 280—80)

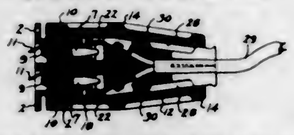
In a road machine, a frame, an axle, a socket member supported by said axle, a kingbolt secured to said frame and having a hollow ball portion engaging said socket member and forming with said socket member an enclosed connection receiving space, adjustable means on said axle, and an adjusting connection for said adjustable means extending through said connection receiving space, said connection including a universal connection having its pivotal center substantially concentric with the pivotal center of movement between said ball portion and said socket member, the coincidence of said centers enabling operation of said adjustable means in any relative angular position of said frame and said axle.

2,100,006
PRINTING OR REPRODUCING COLOR PHOTOGRAPHS
Geoffrey Bond Harrison and Stanley Dennis Threadgold, Ilford, England, assignors, by mesne assignments, to Dufay-Chromex Limited, Aldwych, London, England
Application April 29, 1935, Serial No. 18,952
In Great Britain May 2, 1934
5 Claims. (Cl. 95—75)



1. The method of photographic printing a master photograph on multi-color screen material having a multi-color screen of which the color elements form regularly recurring similar pattern units but which are of irregular arrangement within the unit onto light sensitive multi-color screen copy material which comprises the step of exposing the copy material, while closely adjacent to the master, to light passed through the master from a plurality of differently colored sources, the colors of the sources being respectively similar to colors of the master screen elements and the distance of the source of each color from the master screen, the effective size of each source and the spacing of the master and copy screens being so co-related with the size of the master screen elements of color similar to the source that the light from the source passed by each master screen element of similar color spreads over an area on the copy screen substantially equal to the area of a master screen pattern unit, at least some of the spreads being different in amount in different directions.

2,100,007
MECHANICAL PENCIL
Paul S. Hauton, Atlanta, Ga.
Application February 24, 1933, Serial No. 658,355
2 Claims. (Cl. 120—18)

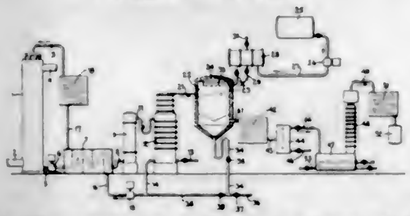


2. A mechanical pencil comprising a tip having a lead guide orifice, lead moving means comprising a threaded helix, and a slotted member, means comprising relatively movable exterior members arranged end to end for housing and driving the lead moving means, a cylindrical liner fitting the inside of one of the exterior members and extending beyond the end of said member and into the other exterior member and having a reduced lower cylindrical end for seating and locking with the slotted member beyond the end of said one exterior member, and a tapered tip having a friction fit on the said reduced end of the liner and abutted against the opposed end of the said one exterior member.

2,100,008
PICTURE PROJECTING DEVICE
Clarence L. Stephens, Bayside, N. Y.
Application June 8, 1936, Serial No. 84,109
4 Claims. (Cl. 88—28)

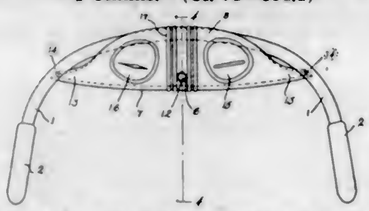
1. Picture projecting means in the form of a two-part, hinged pistol having a handle and a barrel, a lens in said barrel, an endless film bearing a succession of pictures, and having marginal, equi-spaced holes, guide means for said film in said barrel, battery cells in said handle, a light bulb, a circuit therefor, a slidable bar, guides therefor mounted in said barrel, a trigger depending from said bar for its operation, said guides also serving as stops to limit the throw of said bar, spring means to hold said bar retracted, an insulated circuit closing interponent extended from said bar, a spring pawl also carried by said bar, said bar when moved by its trigger causing said pawl to engage a hole in said film and shift said film to bring a succeeding picture into line with said bulb and lens and then causing said interponent to close said circuit.

2,100,009
ELECTRICAL CONNECTER
James J. Hardy, Jr., Cincinnati, Ohio
Application March 8, 1934, Serial No. 714,643
10 Claims. (Cl. 173—328)



9. A female member for an electrical connecter, comprising an outer shell roughly of the shape of a truncated cone, similarly shaped inner contact carrying means having limited longitudinal and free rotational movement within said shell, said inner means having central longitudinal means for carrying and gripping a conductor substantially at its point of exit therefrom, by cooperation with said outer shell said female member having means for positively coupling and uncoupling a male member.

2,100,010
MANUFACTURE OF NEW CELLULOSE COMPOUNDS AND OF ARTIFICIAL MATERIALS THEREOF
Leon Lilienfeld, Vienna, Austria
No Drawing. Application June 22, 1932, Serial No. 618,802. In Great Britain July 4, 1931
22 Claims. (Cl. 18—54)



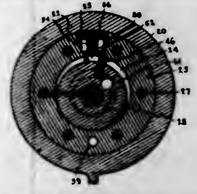
18. In the manufacture of shaped artificial structures, the herein described improvement which comprises reacting on cellulose in the presence of an alkali, with an organic body containing nitrogen, oxygen and halogen, each attached to a different carbon atom in said body, and xanthating the cellulosic body produced by such action.

2,100,011
RECOVERY AND PURIFICATION OF HYDROCARBON OIL
Malvin R. Mandelbaum, New York, N. Y., assignor to The Gray Processes Corporation, Newark, N. J., a corporation of Delaware
Application November 16, 1933, Serial No. 698,327
2 Claims. (Cl. 196—8)

1. The process of purifying a mixture of hydrocarbon vapors consisting substantially entirely of benzol, toluol and xylols and steam in order to remove unstable unsaturated constituents from said hydrocarbons, which comprises passing said mixture of hydrocarbon vapors and steam through a body of solid adsorbent catalytic material effective to promote polymerization of unstable unsaturated constituents of said vapors to polymers of higher boiling points, and simultaneously passing through said body of adsorbent material a relatively high boiling solvent oil heated to a temperature sufficiently high to maintain the desirable constituents in said hydrocarbon vapors and said steam during the passage thereof through the catalytic material in vaporous form but below a temperature at which vaporization of said high boiling solvent oil takes place to thereby assist in maintaining the efficiency of the adsorbent by removing polymers therefrom.

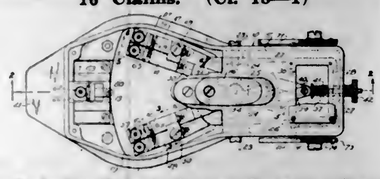
2,100,012
BICYCLE
Onnie Mankki, Cleveland Heights, Ohio, assignor to The Cleveland Welding Company, Cleveland, Ohio, a corporation of Ohio
Application May 29, 1936, Serial No. 82,569
4 Claims. (Cl. 74—551.1)

3. In a bicycle, the combination of a pair of handle bars, a clamping post securing said handle bars intermediately thereof, a metallic apron overlying said post and the central portion of said handle bars and provided with downwardly extending flanges respectively forwardly and rearwardly of said posts, means securing said apron to said post, said apron also provided with reduced lateral extensions extending under said handle bars at opposite points spaced from said post, and means securing said lateral extensions to said handle bars.



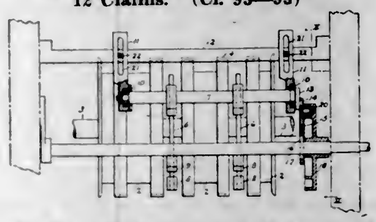
2,100,013
MAUSOLEUM
William A. Martin, Trenton, Mo.
Application June 11, 1937, Serial No. 147,662
11 Claims. (Cl. 72—7)

1. In a vault of the character described, a cover adapted to be mounted in said vault, a layer of sealing material on said cover, a top for the vault, and means for displacing a portion of said layer to provide a convex surface therefor.



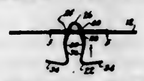
2,100,014
COMPRESSOR
Fred M. McCracken, Norwood, Ohio
Application May 29, 1933, Serial No. 673,393
10 Claims. (Cl. 230—145)

4. In a gyratory compressor, the combination with a cylinder member and an eccentric member, one of which is stationary and the other movable in a gyratory manner, of a vapor-tight flexible tubular structure having one end hermetically connected to said stationary member and the other end hermetically connected to said movable member, said structure acting to prevent rotation of said movable member about its axis without restricting its freedom to gyrate and being arranged in relation to said members so as to



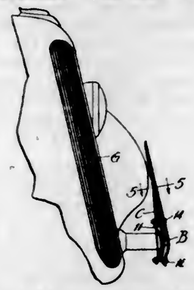
receive within said tubular structure leakage of vapor from the compression chamber of said compressor and thus serve as a seal to prevent escape of said vapor to the atmosphere.

2,100,015
WASHER PLACING MACHINE
Wilbert H. Patten, Trenton, N. J., assignor to Trent Machine Company, Trenton, N. J., a corporation of New Jersey
Application March 7, 1936, Serial No. 67,685
16 Claims. (Cl. 18—1)



1. A device for placing washers on pins comprising a frame, a movable washer feeding finger, and a second washer feeding finger carried by the first finger and movable relative thereto.

2,100,016
DELIVERY MECHANISM FOR USE IN DELIVERING THE PRODUCTS OF PRINTING MACHINES IN COUNTED BATCHES
Cecil George Quick, Donald Arthur Ball, and William Arnold Whitehead, London, England, assignors to R. Hoe & Co., Inc., New York, N. Y., a corporation of New York
Application May 8, 1936, Serial No. 78,648
In Great Britain June 4, 1935
12 Claims. (Cl. 93—93)



1. Delivery mechanism comprising in combination a fly, means rotating the fly, a conveyor device adapted to move past the fly in such a direction that while receiving products from the fly the conveyor moves in the same general direction as the delivery side of the fly, a pair of abutment members, means to oscillate the abutment members into two positions spaced differently from the periphery of the fly in the first of which positions a first abutment member is presented to products carried by the fly and in the second of which positions a second abutment member is presented, the two members being so disposed relatively to each other that the said second abutment member when presented allows products to travel further with the fly than the first abutment member, and means operating periodically to quickly oscillate the members between the first and second positions.

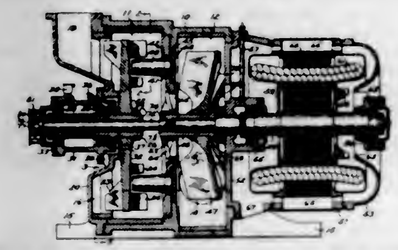
2,100,017
SECURING DEVICE
John H. Van Uum, Lakewood, Ohio
Application August 2, 1932, Serial No. 627,243
11 Claims. (Cl. 24—213)

1. A spring fastener comprising a single integral elongated piece of sheet metal spring strip stock bent to form an enlarged diamond shaped head for insertion into a suitable opening formed in one of two parts to be fastened together in overlying relationship, the forward sides of said diamond shaped head being provided with longitudinal ribs, the ends of the stock projecting oppositely in planes that are inclined toward the enlarged head at an obtuse angle with respect to each other, whereby when the enlarged head is inserted in an opening in one of said parts said ends urge the other part against the former part.

2,100,018
GRILLE GUARD
Anthony V. Weasler and William J. Dooley, West Bend, Wis., assignors to Pick Manufacturing Company, West Bend, Wis., a corporation of Wisconsin
Application January 8, 1937, Serial No. 119,552
5 Claims. (Cl. 293—55)

1. A grille guard comprising a vertical plate, means extending rearwardly from the plate at a point near its lower end adapted to rest upon the upper edge of a supporting bumper whereby to sustain the plate thereon with the major portion of its length thereabove, and a cleat engageable with the supporting bumper and plate in adjustable connection with the plate and exerting a bracing pressure against the plate at an elevated point remote from the bumper.

2,100,019
WINDSHIELD DEFROSTER BLADE
Arlis Rolland Wilson, Chicago, Ill.
Application August 17, 1936, Serial No. 96,359½
3 Claims. (Cl. 219—19)

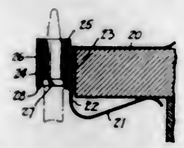


1. A windshield defroster blade comprising a heat reflecting plate adapted to be connected to the movable element of a windshield wiper, a fabric pocket carried by said plate and extending

therefrom into windshield wiping position, and a heating element removably disposed within said

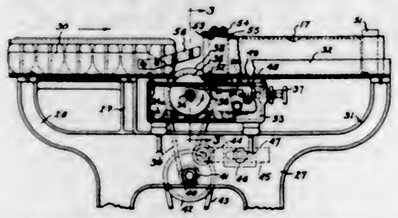
pocket and in contact with said plate and said pocket.

2,100,020
PULVERIZING APPARATUS
L. V. Andrews, Worcester, Mass., assignor to Riley Stoker Corporation, Worcester, Mass., a corporation of Massachusetts
Application March 14, 1934, Serial No. 715,399
13 Claims. (Cl. 83—11)



8. A pulverizing apparatus comprising a casing shaped to provide a pulverizing chamber and a fan chamber communicating therewith, a rotatable shaft, bearings supporting the shaft, a hollow rotatable shaft substantially aligned with the first shaft, bearings supporting the hollow shaft independently of the first shaft, a pulverizing rotor secured to one of the shafts and located within the pulverizing chamber, a fan secured to the other shaft and located within the fan chamber, and a shaft extending through the hollow shaft and operatively connecting the other aligned shaft to the remote end of the hollow shaft.

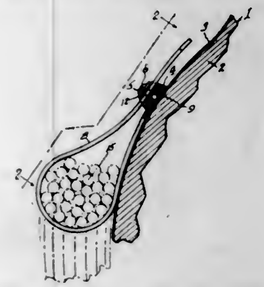
10. A pulverizing apparatus comprising a casing shaped to provide a pulverizing chamber and a fan chamber communicating therewith, a motor having a rotatable shaft, a fan secured to the motor shaft and located within the fan chamber, a hollow rotatable shaft substantially aligned with the motor shaft, bearings supporting the hollow shaft independently of the motor shaft, a pulverizing rotor secured to the hollow shaft and located within the pulverizing chamber, and a shaft extending through the hollow shaft and operatively connecting the motor shaft to the remote end of the hollow shaft.



2,100,021
CULINARY ARTICLE
Nathan Bell, Los Angeles, Calif.
Application January 13, 1936, Serial No. 58,812
2 Claims. (Cl. 146—170)

1. A culinary article comprising rectangular open-ended sleeve having spaced cutting blades for cutting into strips, a string bean forced through said sleeve; a holder having an opening to receive the sleeve; yieldable flanges projecting from the holder between which the sleeve is forced and is frictionally retained against withdrawal from the opening; means on the flanges with which the sleeve co-acts to definitely limit the extent to which the sleeve can be inserted; and

means by which the holder can be attached to a support.



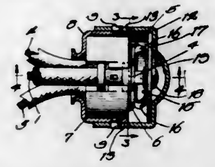
2,100,022
CONTAINER ASSEMBLING MACHINE
Samuel Bergstein, Cincinnati, Ohio, assignor to Edna May Bergstein and Robert Morris Bergstein, as trustees
Application August 6, 1934, Serial No. 738,635
9 Claims. (Cl. 93—6)

1. Apparatus for assembling an inner container with an outer tubular container by causing entrance of the inner container through an open end of said tubular container, comprising alined trough members with adjacent ends spaced apart, adhesive applying means between said ends, having its effective adhesive applying surface above the planes of the bottoms of the trough members and located in the path of travel of a bottom portion of the inner container from one trough into the tubular container held in the other trough, which bottom portion is to carry adhesive from said applying means and thereby adhere to the interior surface of the bottom of the tubular container, means receiving top and bottom edge portions of the open end of the tubular container as it is slid along the trough toward the adhesive applying means, said means diverging in the direction of sliding, to distort said edges upward and downward, respectively, and said means being laterally displaced from the path of travel of the bottom portion of the inner container, but effecting sufficient downward distortion of the bottom edge portion to prevent its scraping adhesive from the entering bottom portion, and said one trough, from which the inner container slides, being provided with members converging across the path of the inner container in the direction of its passage to the outer container, to reduce the width of the inner container as it enters the outer container.

2,100,023
LARIAT HOLDER
Edward G. Brown, Wilson, Wyo.
Application June 29, 1937, Serial No. 150,991
8 Claims. (Cl. 54—46)

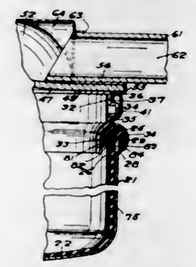
1. The combination with a saddle, of a lariat holder secured thereto and comprising a base member having a transverse notch therein, a strap in the form of a loop having one end secured to said base member and its opposite end detachably secured in said notch and frictionally held there-

in so as to be readily detachable by pulling on the free end of said strap.



2,100,024
ODOMETER FOR MOTOR VEHICLES
Edward V. Dardani, Southport, Conn.
Original application June 4, 1934, Serial No. 728,951. Divided and this application December 15, 1934, Serial No. 757,661
11 Claims. (Cl. 235—95)

1. In an odometer for motor vehicles, the combination of means responsive to the speed of the vehicle; normally inoperative means for indicating, up to a predetermined distance, the distance traveled; operating means therefor; and means operating by the return of the speed-responsive means to zero position upon the stopping of the vehicle for conditioning the said distance-indicating means for operation by said operating means to indicate, upon resumption of travel of the vehicle, the distance covered since the vehicle was last stopped.

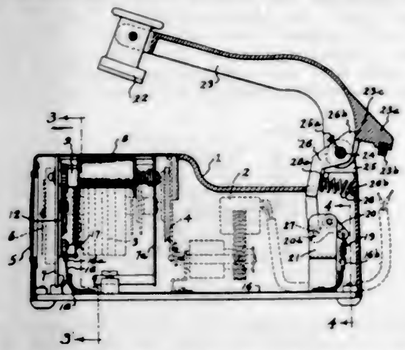


2,100,025
ELECTRICAL CONNECTING MEANS
Harry A. Douglas, Bronson, Mich., assignor to Kingston Products Corporation, a corporation of Indiana
Application March 5, 1934, Serial No. 714,081
2 Claims. (Cl. 173—328)

1. An electrical connecting device, comprising: a body; a plurality of electrical conductors insulatably carried by said body, each having a contact face disposed at one side of said body, said contact faces being insulated from each other; a first cup-shaped member, having its peripheral wall disposed about the edge wall of said body, and having its closure wall abutting the opposite side of said body, said closure wall having an aperture accommodating said conductors; a second cup-shaped member, enclosing said one side of said body, and having its peripheral wall disposed about the peripheral wall of said first cup-shaped member; connecting means, comprising parts respectively carried by the peripheral walls of said first and second cup-shaped members, said connecting means being constructed and ar-

ranged to detachably hold said cup-shaped members in assembled relation; an insulating disc, bearing against the closure wall of said second cup-shaped member; and a plurality of electrically connected spring arms carried by said insulating disc, and constructed and arranged to resiliently engage said contact faces, so as to electrically connect said conductors to each other.

2,100,026
LIQUID EXPRESSER
Louis F. Ducker, Mariemont, Ohio, assignor to Richard A. Kaps and Charles H. C. Van Pelt, both of Cincinnati, Ohio, and said Louis F. Ducker, trustees
Application March 23, 1931, Serial No. 524,619
4 Claims. (Cl. 100—50)

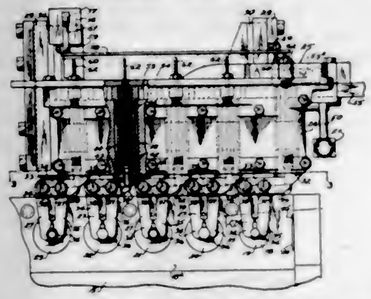


2. In an expresser, the combination of a receptacle including a cover, the receptacle having an annular recessed seat and the cover having an annular seat opposed to the recessed seat; and a flexible wall in the receptacle having an annular rib at its periphery provided with an annular lip initially seating on the seat of the cover, said annular rib being resilient and expanding into said recess initially and under the action of fluid pressure, having its seating pressure increased on said seats as the pressure in the receptacle increases, thereby sealing the wall relative to the receptacle.

2,100,027
TIME STAMP RIBBON FEED MECHANISM
Joseph W. Faris, Cincinnati, Ohio, assignor to The Cincinnati Time Recorder Company, Cincinnati, Ohio, a corporation of Ohio
Application November 18, 1935, Serial No. 50,271
7 Claims. (Cl. 101—336)

1. In a time stamp having a type ribbon, a mechanism for feeding the same, and an operat-

ing handle, an operative connection between the



said handle and the said mechanism comprising a steel ribbon.

2,100,028

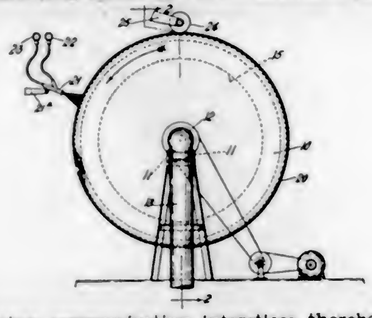
TRANSFER MECHANISM

Lee A. Frayer, Kent, Ohio, assignor to The Lamson & Sessions Company, Cleveland, Ohio, a corporation of Ohio

Application February 27, 1936, Serial No. 66,104
27 Claims. (Cl. 10—12)

1. In apparatus of the character described, a plurality of stations lying in or adjacent a given plane, a plurality of article holders, and means pivoting said holders between stations for arcuate swinging movement in a plane extending substantially normal to said given plane.

2,100,029



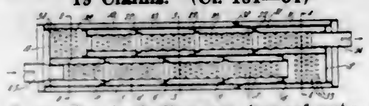
POROUS RUBBER PRODUCT AND METHOD OF MAKING THE SAME

John R. Gammeter, Akron, Ohio, assignor to United States Rubber Company, New York, N. Y., a corporation of New Jersey

Application April 8, 1933, Serial No. 665,080
16 Claims. (Cl. 91—68)

1. That method for making a vulcanized, tacky, porous rubber material which comprises spraying a mist of well-defined globules of vulcanizable latex containing a tacky resin and sulphur sufficient only for partial cure onto a heated surface so as to avoid the formation of a continuous stream of the liquid latex on said surface but partly to dry and agglomerate the globules thereon, and curing said material, said globules adhering by surface contact and there being numerous interstices through the material between globules.

8. A rubber latex product comprising agglomerated, adhering, vulcanized rubber globules



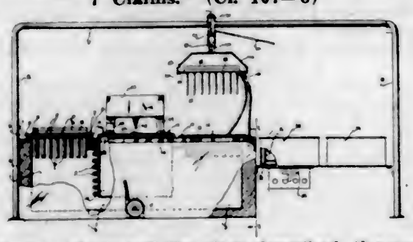
having communicating interstices therebetween to provide porosity.

2,100,030

SILENCER

Lucien L. Haas, Buffalo, N. Y., assignor to Buffalo Pressed Steel Company, Inc., Buffalo, N. Y.

Application June 7, 1934, Serial No. 729,451
19 Claims. (Cl. 181—54)



1. A muffler including an imperforate outer shell, heads to which the opposite ends of said shell are connected and provided with openings for inlet and discharge of exhaust gases, a second shell arranged within said outer shell and spaced therefrom to form with said outer shell a resonator chamber, a pair of conduits arranged side by side within said second shell, one of said conduits receiving gases at one end thereof from the inlet opening and the other conduit discharging gases from the other end thereof through the discharge opening in the other head, each of said conduits terminating at their other ends at distances from said heads, at least one of said conduits being perforated throughout the greater portion of the length thereof, means arranged about the perforated portion of said conduit to form therewith a sound attenuating chamber, said second shell forming a return duct in which gases flow in a direction opposite to that in said conduits, said second shell having apertures to permit gases and sound waves to enter said resonator chamber.

2,100,031

DEVICE FOR MAKING FROZEN CONFECTIONS

Charles G. Hall, Caldwell, Idaho, assignor to Edible Bottle Company, a corporation of Idaho

Application November 30, 1934, Serial No. 755,451
7 Claims. (Cl. 107—8)

1. In a device of the class described, the com-

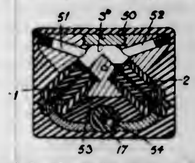
bination of an insulated cabinet having a plurality of compartments, means for predetermining the temperature in each of the compartments, bottom and top mold sections, means for transporting each of the mold sections, one at a time, in either direction longitudinally of the cabinet and means for continuously circulating a refrigerant through each of the core sections comprising the top mold.

2,100,032

FLY SWATTER

Lynde De F. Hokerk, Utica, N. Y., assignor to Kerk Guild, Inc., Whitesboro, N. Y., a corporation of New York

Application May 29, 1936, Serial No. 82,666
3 Claims. (Cl. 43—137)



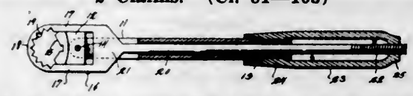
1. A fly swatter head comprising a plurality of layers of superimposed burlap, and adhesive material applied to the inner opposed faces of the burlap layers and uniting the same to form a unitary swatter head, said adhesive material forming a stiffening element and converting the initially limp burlap into a relatively stiff, highly flexible swatter head and arranged to leave uncoated and open certain of the interstices of the burlap for the passage of air through the swatter head in the use of the article, said burlap layers presenting a soft exterior surface at both faces of the swatter head.

2,100,033

MERCURIAL ELECTRIC CUT-OUT

Francis Thomas Jenkins, Ealing, London, England

Application December 29, 1936, Serial No. 118,141
In Great Britain October 16, 1935
16 Claims. (Cl. 200—113)



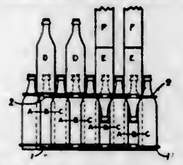
1. A mercurial electric cut-out containing a plurality of mercurial columns, said columns being contained in alternative paths for the passage of the current through the cut-out and being such that when the current passing through a column exceeds a predetermined value, mercury is expelled therefrom, a separate collector associated with each column, said columns being inclined to one another and at least one impact surface being provided, arranged so that mercury expelled from one column is caused to strike an impact surface above the collector associated with another column in such manner that the expelled mercury is positively directed into such collector and into such other column in order to render another of such alternative paths available for the passage of the current.

2,100,034

WRENCH

Carl H. Leonard, Wakefield, Nebr., assignor of one-half to John Ashford, Winnebago, Nebr.

Application February 11, 1937, Serial No. 125,336
2 Claims. (Cl. 81—163)



2. A wrench comprising a tubular member provided with threads at one end thereof, spaced apart parallel arms carried by the other end of the member, a stationary jaw member carried by said arms and disposed therebetween, a movable jaw member disposed forwardly of said stationary jaw member, a pair of parallel arms secured to said movable jaw member and engaging on opposite sides of said stationary jaw member, an operating rod disposed within said tubular member and secured at its forward end to said latter parallel arms, threads carried by the rear end of said operating rod, said latter threads being reversely pitched from said first threads, and a hollow handle provided with interior threads engaging said first named threads and a second series of interior threads engaging said second named threads.

2,100,035

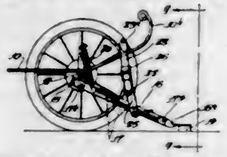
MEANS FOR TYING BOTTLES TOGETHER FOR STACKING PURPOSES, SUCH AS IN DISPLAYS

Anson A. Merrick, Detroit, Mich., assignor to James Vernor Company, Detroit, Mich.

Application July 28, 1936, Serial No. 93,094
3 Claims. (Cl. 211—74)

1. In a means for tying bottles together for stacking purposes, comprising a band of wire or similar material formed into a plurality of outwardly extending loops each substantially defining a semi-circle, said loops being in such spaced relationship that the extended arcs thereof do not overlap.

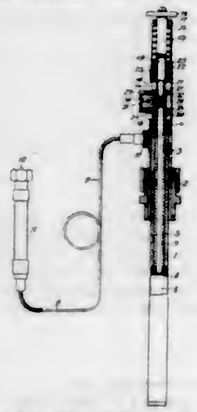
2,100,036



BRAKE FOR BABY CARRIAGES

James Michal, Chicago, Ill., assignor to Storkline Furniture Corporation, Chicago, Ill.

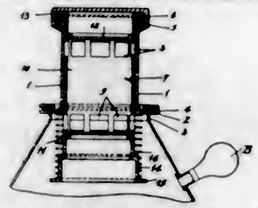
Application January 21, 1936, Serial No. 60,102
11 Claims. (Cl. 188—20)



1. A ground brake for baby carriages comprising a brake member carried in poised position, foot-operated means to depress the member into

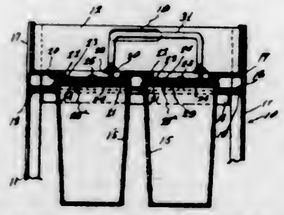
ground engagement, means to lock the member in the position of engagement, foot-operated means to release the locking means, and a lifting

element effective to restore the member to the poised position when said release has been accomplished.



2,100,037
THERMOSTAT
Hermann Sandvoss, Frankfort-on-the-Main, Germany
Application June 5, 1935, Serial No. 25,135
In Germany June 28, 1934
2 Claims. (Cl. 297—8)

1. A thermostat comprising a casing, a container for an expanding liquid connected to the casing, a spring bellows in the container, a bellows rod in the spring bellows, a regulating member mounted in the casing for rotation and axial displacement, a stop in the casing, a spring operatively connected to the regulating member for holding the regulating member against the stop, means for rotating the regulating member, a female thread on the regulating member, a male thread on the bellows rod engaging in the female thread of the regulating member, a carrier secured to the casing, a scale on the carrier, a pointer rotatably mounted on the carrier for cooperation with the scale, mechanism on the carrier for rotating the pointer, a worm gear forming part of the mechanism, a worm meshing with the worm gear and mounted on the regulating member for relative axial displacement with respect to, and for positive tangential engagement with, the regulating member, and checks on the casing arranged to engage opposite sides of the worm for holding it in position with respect to the worm gear.

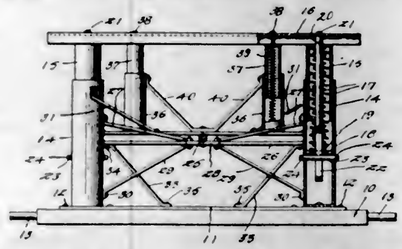


2,100,038
PLUG OR CORK FOR DELIVERING DOSES
Robert Schubenel, Le Vesinet, France
Application December 26, 1935, Serial No. 56,277
In France December 28, 1934
8 Claims. (Cl. 221—104)

1. A dispensing can including a substantially cylindrical nozzle, a measuring valve slidably carried in said nozzle, said valve comprising a substantially cylindrical member having a length greater than that of said nozzle, a pair of transverse partitions in said valve, said partitions being spaced apart a distance less than the length of said nozzle, an inlet opening in said valve intermediate said partitions and adjacent the lowermost partition, an outlet opening in said valve intermediate said partitions and adjacent the up-

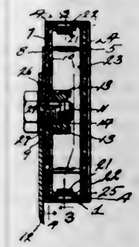
permost partition, a portion of said valve below the lower partition being formed to provide a stop for limiting the outward movement of said valve, the lower end of said valve being upset to form an annular flange providing a spring seat, and a helical spring surrounding said valve and having one end seating on said flange and the other end seating against the top of said can, said spring comprising means for normally retaining said valve at its innermost limit.

2,100,039
CONTAINER FILLING APPARATUS
Thomas A. Standley, Dallas, Tex.
Application June 13, 1936, Serial No. 85,146
5 Claims. (Cl. 226—126)



1. In a structural assemblage of the class described, an apertured plate adapted to accommodate a plurality of ice cream or similar cups, an ice cream containing and carton charging pan of general rectangular form, said rack plate being also of rectangular form and disposed in parallelism beneath the bottom of said pan, resilient assembling hooks carried by the marginal portion of the pan and releasably engageable with the marginal edges of said plate, the bottom of said pan being provided with a plurality of openings provided with depending annular carton retaining elements, individual valves mounted in said depending annular retaining elements, and a single operating frame mounted in the pan and having operating connection with the valves for simultaneously controlling the valves.

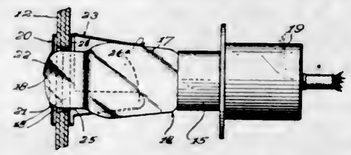
2,100,040
COIL SPRING TRAILER
Leonard Sterling, Newton, Tex.
Application August 1, 1936, Serial No. 93,894
1 Claim. (Cl. 280—106.5)



A trailer comprising upper and lower horizontal frame bars, a lower pair of tubular guide members secured to said lower bar, a second pair of tubular members secured to said upper bar

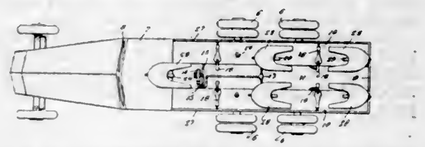
and slidably engaging said lower tubular members, an intermediate frame bar secured at the ends thereof to said lower tubular members at a point spaced upwardly of the lower ends thereof, telescoping tubular members secured to said intermediate and said upper bar between said first named guide members, expanding springs within said tubular members, a plate in each of said lower guide members upwardly of the lower ends thereof engaging against the lower ends of

said springs, a pair of elongated rods secured to said upper bar and extending axially downward in said first named upper tubular members, said rods each having an elongated opening therethrough, a pin extending transversely through each lower guide member and the opening therein to thereby limit the vertical movement of said upper bar, a draft bar, forwardly extending bracing means secured to said lower guide members and to said draft bar, and an axle secured to said lower bar.



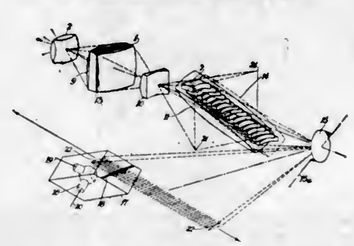
2,100,041
HOLDER FOR BRAKE INSPECTION TAGS
George Thieler, Jr., New Orleans, La.
Application June 6, 1936, Serial No. 83,982
5 Claims. (Cl. 40—2.2)

1. A housing and locking device comprising a casing, a securing bolt extending into said casing, a nut carrying plate carried by the bolt within the casing and through which the bolt extends, a nut threaded on the bolt and anchored to the nut carrying plate, a spring arm detent disc within the casing on the bolt and rotatable therewith and spring arms carried by the detent disc and in the path of apertures in the nut carrying plate and adapted to interengage in said apertures when the bolt is rotated to an unscrewed position.



2,100,042
TUBE HOLDER
Frederick J. Travis, Chicago, Ill.
Application April 17, 1937, Serial No. 137,431
14 Claims. (Cl. 250—27.5)

5. In combination a panel, an aperture therein for the reception of a tube tip to be visible exteriorly of the panel, an escutcheon secured to the panel and provided with a fenestration and a seat for a tube tip projecting through said aperture from interiorly of the panel, an annulus disposed on the interior surface of the panel with the opening of the annulus in registry with the panel aperture, said annulus having tangs which



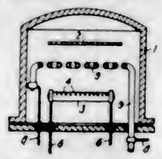
extend through the panel aperture and are turned against the exterior of the panel to underlie the escutcheon, and a plurality of spring fingers carried by said annulus arranged to embrace and press against a tapering part of a radio tube yieldingly to urge the tip of the tube through the annulus and panel aperture and against the aforesaid tube tip seat.

2,100,043
RIOT CAR
Victorino L. Tunaya, Brooklyn, N. Y.
Application February 18, 1936, Serial No. 64,546
1 Claim. (Cl. 89—36)

A riot car comprising a wheeled platform, said platform being provided with a pair of longitudinally extending liquid tanks defining an elongated aisle between the same, gun turrets mounted on the liquid tanks at spaced intervals, and liquid discharging nozzles mounted on the liquid tanks between the turrets and being connected in communication with the tanks.

2,100,044
TELEVISION
George William Walton, London, England
Application March 16, 1932, Serial No. 599,274
In Great Britain February 27, 1931
8 Claims. (Cl. 178—7.6)

1. Television and the like apparatus having an optical system comprising a scanning aperture, a first and a second laminated optical element, these elements having their laminae disposed in substantially mutually perpendicular planes, the



planes of the laminae of both said elements being substantially parallel to the optical axis of said system, the laminae of said first element having entrant and emergent edge surfaces and the laminae of said second element being lenticular, means for forming an image of an object to be transmitted upon said entrant edge surfaces, means for cooperating with said lenticular laminae in forming in the neighborhood of said aperture images of said emergent edge surfaces and means for producing relative motion between the last named images and said aperture.

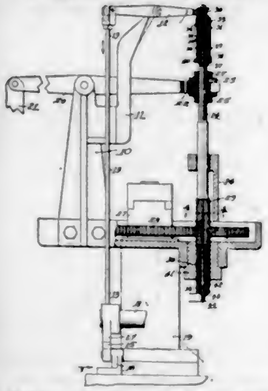
2,100,045

DEPOSITION OF METALLIC FILMS FROM METAL VAPORIZED IN VACUO

Paul Alexander, Brussels, Belgium

Application October 10, 1936, Serial No. 105,091
In Germany October 12, 1935
19 Claims. (Cl. 91—12.2)

1. Apparatus for depositing a metal film on a support in an evacuated chamber, comprising means for vaporizing the metal and means located between the source of the vapor and the support adapted to heat the metal vapor.



15. Process of depositing a metal film on a support in an evacuated chamber, comprising the steps of vaporizing the metal and heating the vapor in its passage from its source to the support.

2,100,046

COIL STRIPPER

William H. Blount, West Brookfield, Mass., assignor to Sleeper & Hartley, Inc., Worcester, Mass., a corporation of Massachusetts

Application November 4, 1935, Serial No. 48,074
2 Claims. (Cl. 153—64)

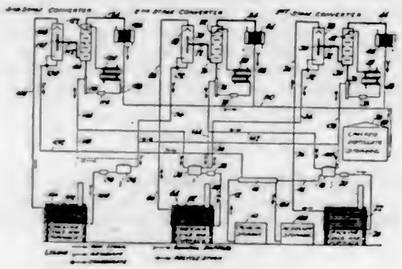
1. In a device of the character described, the combination with an arbor, of a hollow spindle through which the arbor extends, means for pulling the arbor along the spindle, means for yieldingly moving the arbor in the opposite direction, a cylinder surrounding the yielding means, a skirt surrounding the cylinder to which said pulling means is connected and which is capable of sliding relative to the cylinder, and means for preventing a relative rotary motion between the skirt and cylinder.

2,100,047

PROCESS OF MANUFACTURING SOAP

Karl Braun, Berlin-Frohnau, and Hermann Plauson, Berlin, Germany

No Drawing. Application March 20, 1936, Serial No. 69,976. In Germany February 7, 1935
5 Claims. (Cl. 87—16)



1. A process of manufacturing clear soap with sulphite cellulose spent lye, which consists in chlorinating such lye, thereafter neutralizing the treated lye with an acid, then removing the precipitated matter to obtain clear lye, oxidizing the lye, dehydrating the same, and thereafter incorporating soap to give the completed product.

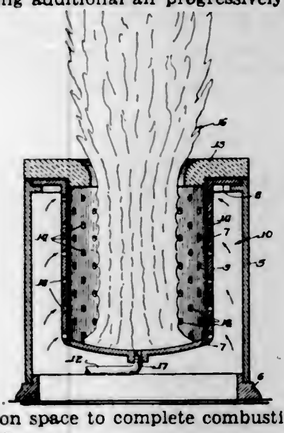
2,100,048

PROCESS OF CRACKING OIL

Cecil E. Beatie, Forest Hills, N. Y., assignor, by mesne assignments, to Power Patents Company, Jersey City, N. J., a corporation of Maine

Application July 31, 1920, Serial No. 400,531
18 Claims. (Cl. 196—49)

13. A hydrocarbon oil cracking process which comprises passing the oil serially through a plurality of interconnected reaction zones and maintaining the oil under cracking conditions of temperature and pressure in each of said zones, removing vapors from each of said reaction zones and introducing the same to independent dephlegmating zones associated with the respective reaction zones, condensing insufficiently cracked fractions of the vapors as reflux condensate in said dephlegmating zones, passing reflux condensate from a dephlegmating zone associated with one of said reaction zones into a preceding reaction zone in the series, and removing and condensing the vapors uncondensed in said dephlegmating zones.



2,100,049

METHOD OF BURNING FUEL

Oscar L. Bock, Madison, Wis., assignor to Bock Oil Burner Corporation, Madison, Wis., a corporation of Wisconsin

Application November 8, 1934, Serial No. 752,035
6 Claims. (Cl. 158—117.5)

6. The process of combustion which consists in introducing a liquid hydrocarbon fuel into one end of a combustion space, introducing into said space adjacent the place of fuel introduction sufficient air to vaporize said fuel at a temperature higher than its end point by combustion of a portion of the fuel vapor sufficient to cause said temperature to be maintained, and afterward introducing additional air progressively into said

combustion space to complete combustion of the fuel vapor.

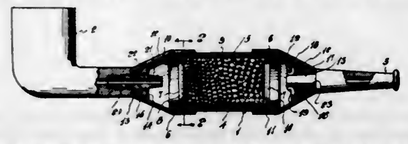
2,100,050

NIGHTDRESS AND PAJAMA

Abraham Gussow, Brooklyn, N. Y.

Refiled for application Serial No. 484,846, September 27, 1930. This application June 26, 1936, Serial No. 87,595
3 Claims. (Cl. 2—83)

1. A night dress and pajama, comprising a lower garment portion with a tubular waist formed with a vertical rear slot to provide for the slipping of the garment down over one's hips, an upper garment portion attached along substantially the front half of the periphery of said tubular waist and having a neck cut out, arm holes, and a back consisting of panel portions connected at their outer sides completely from the shoulders to the waist with the other portions of said garment upper portion and having inclined inner sides to form a cut out back for the garment and of sufficient lengths to be tied together at the rear to form a bow with tails extending over and covering the rear slit in said lower garment portion, and means for changing the position of said bow to produce different style effects.



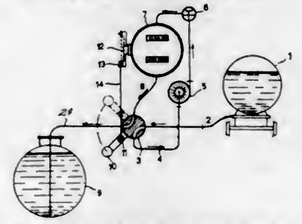
2,100,051

SMOKE FILTER FOR SMOKING DEVICES

Enoch Hallner, Ericson, Nebr.

Application September 26, 1935, Serial No. 42,341
7 Claims. (Cl. 131—12)

1. A smoke filter designed for insertion between two parts of a smoking device through which smoke passes, comprising a cylinder of deformable material, an apertured disk closing each end of the cylinder, filtering material in the cylinder between the disks, said cylinder having portions of each end inturned to form retaining means for the disks, a sleeve at each end of the cylinder



and having the cylinder end frictionally engaged therein, each of said sleeves terminating in a truncated cone, and means in each of said sleeves at the smaller end of the cone portion thereof facilitating the attachment of a portion of the smoking device thereto.

2,100,052

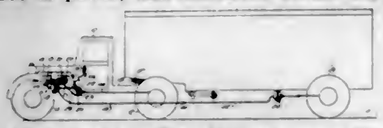
METER FOR MEASURING AND REGISTERING LIQUID VOLUMES RECEIVED AND DELIVERED

František Hejduk and Jan Neumann, Prague, Czechoslovakia

Application December 9, 1935, Serial No. 53,656
In Germany February 9, 1935
2 Claims. (Cl. 73—198)

1. In a two-way system for selectively measuring liquid flow, a pair of tanks, a pair of conduits respectively connecting with said tanks, a current-flow meter comprising a pair of registers and adjustable control means for selectively actuating either of said registers, said meter further comprising liquid-flow actuatable means and a liquid inlet and outlet communicating with said last mentioned means, said last mentioned means being in operative relation with said control means for selectively actuating either of said registers as said control means is adjusted, a four-way valve connected for selectively connecting in its first position the inlet of said meter to the conduit of a first one of said tanks and the outlet of said meter to the conduit of a second one of said tanks, or connecting in its second position the inlet of said meter to the conduit of said second one of said tanks and the outlet of said meter to the conduit of said first one of said tanks, and interlocking means interlocking said valve and said control means for causing said control means to actuate a first one of said registers when said valve is in said first position and to actuate a second one of said registers when said valve is in said second position.

2,100,053



BRAKE CONTROL MECHANISM

Edward G. Hill, Richmond, Va., and John X. Phillips, Washington, D. C., assignors to Hill Engineering Corporation, Richmond, Va., a corporation of Virginia

Application January 31, 1934, Serial No. 709,204
12 Claims. (Cl. 188—3)

1. In a braking system for a truck and trailer combination, a power device for operating the

truck brakes, a power device for operating the trailer brakes, a manually operable control mechanism for connecting the power devices to a source of power, and automatic means depend-

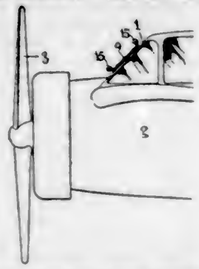
ent solely on the differential pressure acting on said trailer power device for rendering said control mechanism operative for connecting the truck brake power device to the source of power.

2,100,054

ANESTHETIC TANNATE

Russell Hopkinson and Alexander V. Tolstoouhov, New York, N. Y., assignors to Ostro Research Laboratories, Inc., New York, N. Y., a corporation of New Jersey

No Drawing. Application October 27, 1933, Serial No. 695,506
4 Claims. (Cl. 167—52)



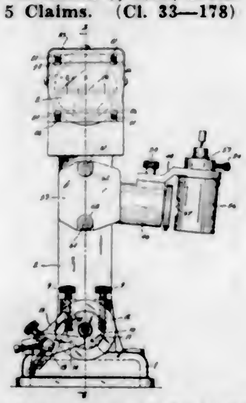
1. A composition for treating skin lesions having therein a compound in the list consisting of 1-ethoxy-4-(beta- diethyl - amino-ethyl) - naphthalene tannate, diethyl-amino-ethyl ester of p-amino benzoic acid tannate, α-butyloxy cinchoninic acid diethyl-ethylenediamine tannate, methyl ethyl dimethylamino-methyl carbinol benzoate tannate, ethenyl-p-diethoxydiphenyl-amidine tannate, tropacocaine tannate, trimethyl-benzoxy-piperidine tannate, benzoxy-dimethyl-amino-methyl dimethyl-amino butane tannate, p - amino - benzoyl dimethyl - amino-methyl-butanol tannate, and p-amino-benzoyl-gamma-dinormal-butylamino propanol tannate.

2,100,055

WINDOW CLEANER

Erwin C. Horton, Hamburg, N. Y., assignor to Trico Products Corporation, Buffalo, N. Y.

Application April 26, 1935, Serial No. 18,474
12 Claims. (Cl. 15—250)



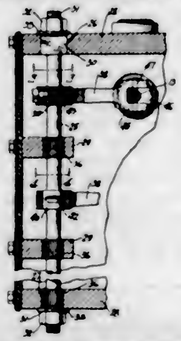
1. A window cleaner comprising a support, a shaft mounted thereon for both axial and rotational movements, wiper means connected to the shaft and adapted to be moved thereby during its axial movement into firm wiping contact with the window surface, a brake member rotatably mounted on the support, centrifugally responsive means movably connected to both the shaft and the brake member to rotate therewith, said responsive means having parts acting on the shaft to also move it axially, resilient means urging the responsive means to its normal position and acting to return the shaft axially for relieving the pressure in the wiping contact when the wiping means is at rest, and means cooperating with the brake member to arrest the rotational movement of the shaft while permitting freedom of axial movement under the urge of said resilient means.

2,100,056

OPTICAL BORE COMPARATOR

Paul Klamp and Royal Kiehl, Canton, Ohio, assignors to The Timken Roller Bearing Company, Canton, Ohio, a corporation of Ohio

Application November 9, 1936, Serial No. 109,842
5 Claims. (Cl. 33—178)



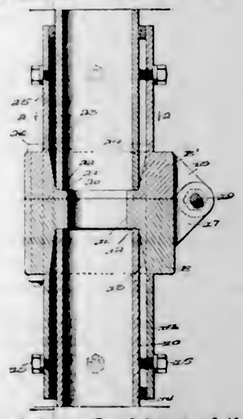
1. In a bore comparator, a work receiving horn having a longitudinal bore and a diametral bore, a pair of L-shaped pins mounted in said diametral bore, said pins being arranged with the base of one against the stem of the other so that the assembled pins have a central opening therethrough, a contact point in the outer portion of the base of each pin, a spindle mounted in said longitudinal bore of said horn and extending through said central opening in said nested pins, connections between said pins and said spindle causing rotary movement of said spindle when said pins move endwise relative to each other, indicating devices actuated by movement of said spindle and means forcing said pins outwardly to project said contact points beyond the surface of the horn.

2,100,057

VALVE SPRING

Henry Krebs, Detroit, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a corporation of Michigan

Application February 24, 1934, Serial No. 712,823
9 Claims. (Cl. 123—90)



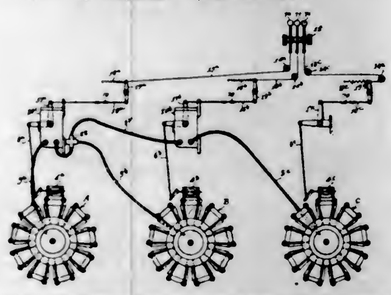
1. In an internal combustion engine, the combination with a plurality of poppet valves having stems, of a shaft disposed in a plane substantially perpendicular to said valve stems and supported rigidly at spaced points on either side of each valve, and a plurality of arms, one allocated to and operatively connected with each valve stem, each arm being secured to said shaft intermediate points of support for the shaft and extending generally perpendicularly to the shaft, said shaft being torsionally stressed intermediate each arm and the adjacent points of support of the shaft to urge the arms in one direction.

2,100,058

LIGHT SUPPORT

Frank C. McGrady, Washington, D. C.

Application October 20, 1933, Serial No. 694,496
3 Claims. (Cl. 248—159)



1. A support for a flood lamp of the type described comprising a base member and a top member, a pair of complementary hingedly connected blocks mounted upon the base member for support of the top member, tubular skirts fixed to said blocks and positioned on opposite sides thereof for the reception of said base and top members, and a bore extending centrally through said blocks having a flange therein for supporting on opposite sides thereof said base and top members, said bore and flange cooperating to support said base and top members in spaced relation with respect to said skirts, and means to secure said base and top members in position.

2,100,059

CONTROL SYSTEM

Silas A. Morehouse, Glendale, Calif., assignor to Rocky Mountain Steel Products, Inc., Los Angeles, Calif., a corporation of California

Application July 22, 1935, Serial No. 32,575
7 Claims. (Cl. 60—97)

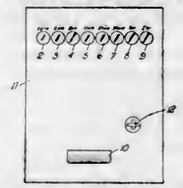
1. In combination with two independently driven shafts to be synchronized, control means for varying the speed of one of said shafts, differential means connected to said two shafts comprising a differential member rotatable in response to a departure from a predetermined speed relation between said shafts, a rotatable driving member coupled to said differential member for rotation thereby, an oscillatable driven member in driven relation with said driving member only through a predetermined arc of oscillation of said driven member, the latter moving out of driven relation with said driving member in response to movement beyond the said arc, means operable in response to oscillation of said driven member beyond said arc for resiliently urging said driven member back into driven relation with said driving member, and means for actuating said control means in response to movement of said driven member within said arc.

2,100,060

SINKER FOR KNITTING MACHINES

Earl R. Piercy, Indianapolis, Ind., assignor to Thomas & Skinner Steel Products Company, Indianapolis, Ind., a corporation of Indiana

Application July 13, 1936, Serial No. 90,356
2 Claims. (Cl. 66—110)



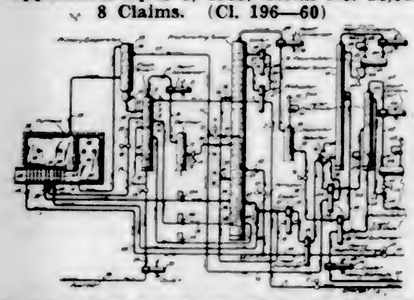
1. A sinker for knitting machines, comprising a flexible sheet-steel body portion provided at the end with a notch and nib, the steel of said sinker having at and in the vicinity of the notch-base a spot which is hard in comparison with the adjacent material.

2,100,061

COIN REGISTERING AND CALCULATING APPARATUS

Uno Sundelin and Karl Axel Teodor Granzelius, Stockholm, Sweden, assignors of part interest to Fredrik Hammaren, Stockholm, Sweden

Application February 17, 1932, Serial No. 593,660
In Sweden November 2, 1926
19 Claims. (Cl. 194—10)



1. The combination with a coin register of the type including a plurality of value indicating keys and means operable upon the actuation of one of said keys to register the value corresponding to the said actuated key, of coin-receiving means including a plurality of coin chutes for receiving coins of different values, electric contact means associated with said coin chutes and operated by the inserted coins, electric circuits controlled by said contact means, electromagnets inserted in said circuits and associated with said value indicating keys, one of said coin chutes adapted for special coins of a value consisting of more than one digit differing from zero, the electric circuit associated with said chute for special coins including relay means for cutting in the electric circuits pertaining to the keys which correspond to the digits of said special coins.

2,100,062

CRACKING OF HYDROCARBON OIL

John W. Throckmorton, New York, N. Y., assignor to Gyro Process Company, Detroit, Mich., a corporation of Michigan

Application April 3, 1935, Serial No. 14,449
8 Claims. (Cl. 196—60)

1. A cracking process comprising heating a hydrocarbon oil under a pressure substantially above atmospheric, separating the heated oil into vapors and unvaporized oil in an evaporating zone, combining the unvaporized oil with a charge oil in a flash zone maintained at a pressure substantially less than that in the evaporating zone, cracking the combined oil in the liquid phase, cracking the vapors in the vapor phase, quenching the reactant from the vapor phase cracking operation to below active vapor phase cracking temperature by means of a cooler hydrocarbon quench oil, separately separating the reactant from the liquid phase cracking operation and the quenched reactant into vapors and unvaporized oil in separating zones maintained at a pressure substantially above atmospheric, fractionating the last mentioned vapors in a single fractionating zone maintained at substantially the last mentioned pressure, returning the unvaporized oil in each of the last mentioned separating zones to the flash zone and removing and condensing vapors from said fractionating zone as a distillate product of the process.

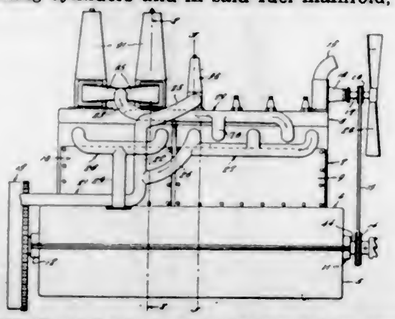
2,100,063

PROCESS FOR THE PRODUCTION OF TANNED PICTURES

Rudolf Zahn, Wiesbaden, Germany, assignor to Kalle & Co. Aktiengesellschaft, Wiesbaden-Biebrich, Germany, a corporation of Germany

No Drawing. Application November 29, 1932, Serial No. 644,920. In Germany December 9, 1931
4 Claims. (Cl. 95—6)

1. Process for the production of tanned pictures which comprises exposing under a pattern a light-sensitive layer comprising a colloidal substance capable of being tanned and a light-sensitive aromatic diazo compound of high molecular weight, which contains at least three six-membered carbocyclic rings and is constituted according to the formula R—X—R_1, wherein X stands for a member of the group consisting of CH_2, oxygen and an imino group and R and R_1 for a radical of the group consisting of aromatic and hydroaromatic radicals of the benzene and naphthalene series at least one of which contains a diazo group, and then dissolving the colloid at the unexposed parts.



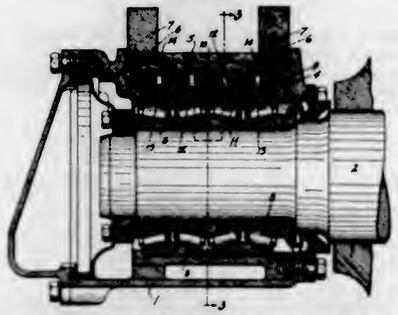
2,100,064

INTERNAL COMBUSTION ENGINE

Alvin K. Zimmerman, Akron, Ohio

Application May 1, 1934, Serial No. 723,373
6 Claims. (Cl. 123—59)

6. In an internal combustion engine comprising working cylinders and compressing cylinders, each of said cylinders having an intake valve and an exhaust valve, a fuel manifold connecting all of the compressing cylinders with some of the working cylinders, an exhaust manifold leading from said working cylinders, first safety valve means in communication with said compressing cylinders and said exhaust manifold, second safety valve means communicating with said fuel manifold and with said exhaust manifold, the first and second safety valve means being normally resiliently closed and arranged to open upon development of excess pressures in said working cylinders and in said fuel manifold, re-



spectively, and arranged to be opened by excessive back pressure in said exhaust manifold, said first and second safety valves each comprising a casing having one end surrounding a valve opening in the corresponding cylinder or fuel manifold, a web across the casing, a valve stem slidable therethrough and having a head cooperating with the corresponding valve opening, a spring on each stem and engaged between one end of the casing and a portion of said stem, and a side port in the casing axially inwardly of said web and axially outward of said valve head, said port being connected with said exhaust manifold.

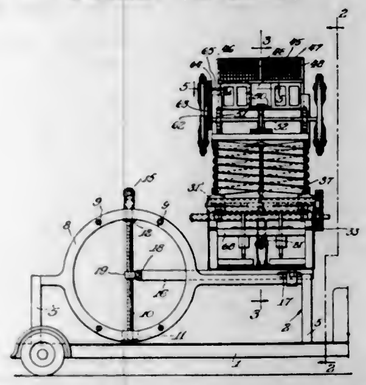
2,100,065

TRUCK

Tracy V. Buckwalter, Canton, Ohio, assignor to The Timken Roller Bearing Company, Canton, Ohio, a corporation of Ohio

Application May 22, 1936, Serial No. 81,209
1 Claim. (Cl. 105—218)

On a car truck, a journal housing having a recess in the top thereof, a cushioning pad of smaller size than said recess mounted entirely therein, and an equalizer plate having a portion of smaller size than said recess supported therein on said pad, said pad comprising thin metallic top and bottom plates and a block of rubber



interposed between and vulcanized thereto, said pad being provided with a series of spaced parallel elongated slots that extend vertically therethrough from top to bottom thereof, said recess having a series of spaced parallel elongated ribs that project upwardly from the bottom thereof and snugly fit the lower portions of said slots and position said pad in said recess with a clearance around all its sides, said equalizer plate having a similar series of elongated ribs that depend therefrom and snugly fit the upper portion of said slots to position said equalizer plate on said pad and centrally of said recess with a clearance around all its sides.

2,100,066

FIRE FIGHTING AND RESCUE APPARATUS

Henry Frank Buchheit, Milwaukee, Wis., assignor of one-half to Annie Mater

Application February 4, 1937, Serial No. 124,151
2 Claims. (Cl. 227—22)

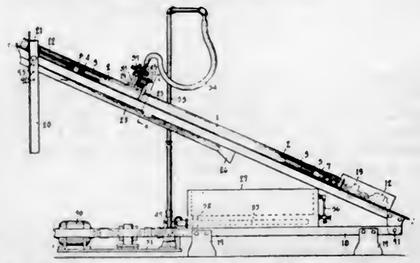
1. In an apparatus of the character described, a bed, supporting arms pivotally mounted on the bed, a pair of annular frames fixedly mounted on the bed, vertically disposed screw-threaded shafts carried by each of said frames, said shafts having screw-threaded connection with the free ends of the supporting arms whereby to transmit collective pivotal movement thereto, a secondary bed carried upon the pivotal supporting arms, elevating mechanism pivotally mounted on said secondary bed movable in a direction at substantially right angles to said supporting arms, spring actuated means on said secondary bed connected to one side of the elevating mechanism for normally imparting an upward thrust thereto, means on the secondary bed connected to the opposite side of said elevating mechanism operable for effecting pivotal movement of the elevating mechanism against the normal thrust of said spring actuated means, and a compartment carried on the elevating mechanism.

2,100,067

VOLUMINOUSLY SWELLABLE SUBSTANCE AND PROCESS OF MAKING SAME FROM WAXES

Henryk Cohn and Conrad Siebert, Berlin, Germany

No Drawing. Application February 4, 1935, Serial No. 4,996. In Germany February 14, 1934
2 Claims. (Cl. 252—1)



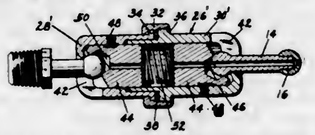
1. The process of making a strongly swellable substance from wool grease, which comprises saponifying the said grease at room temperature with the aid of an alcoholic solution of caustic potash containing petroleum-ether, removing from the saponified grease the product insoluble in the alcohol, and separating from the dissolved part by means of water a water insoluble substance constituting the strongly swellable substance to be produced.

2,100,068

COATING APPARATUS

Melvin J. Conklin, Kalamazoo, Mich., assignor to Sam'l Bingham's Son Mfg. Co., Chicago, Ill., a corporation of Illinois

Substitute for application Serial No. 604,412, April 11, 1932. This application March 23, 1933, Serial No. 662,226
27 Claims. (Cl. 91—43)



22. The method of applying a coating of uniform thickness to an inking roll or the like, comprising rotating an unheated roll to be coated in an inclined position, pouring fluid coating material thereon in a free stream moving longitudinally of the roll and beginning at the upper end thereof, and retarding the natural flow of the coating material longitudinally of the cylinder.

2,100,069

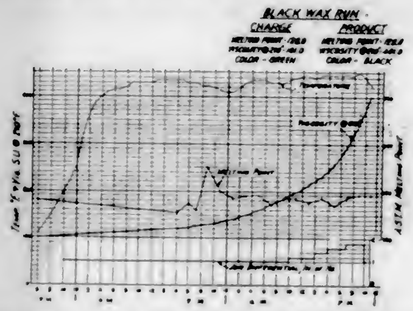
LUBRICATING DEVICE

John L. Creveling, Tucson, Ariz., assignor to The Lubrication Corporation, Chicago, Ill., a corporation of Delaware

Application September 25, 1935, Serial No. 42,018
1 Claim. (Cl. 285—92)

A connector for the ends of two pipe sections comprising swivelly connected shell portions, each of said portions having a slot in its end for engaging with a pipe section, said slot being so arranged as to provide for angular movement of the connected section through substantially 90° while limiting such angular movement to a single plane.

2,100,070



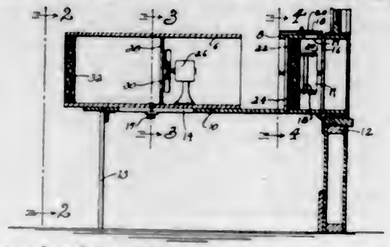
MANUFACTURE OF BLACK WAX

Aubrey D. David, Clarendon, Pa., assignor to The Petroleum Processes Corporation, Wichita, Kans., a corporation of Kansas

Application November 19, 1935, Serial No. 50,523
3 Claims. (Cl. 196—42)

3. The herein disclosed process of manufacturing black wax which comprises heating petro-

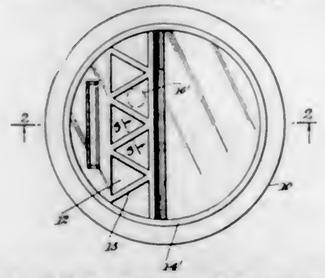
latum stock in a confined state to a temperature on the order of from 300 to 600° F. and forcing a controlled volume of air under pressure through the confined heated mass of from one quarter to fifteen cubic feet per gallon of charge over a



period of from about five to one hundred hours and thereby directly converting said petrolatum stock to a smooth ductile wax of permanent black color, of equal or higher melting point, greatly increased viscosity, lower penetration test and low acidity.

2,100,071
ESCAPEMENT DEVICE ON PAPER CARRIAGES FOR TYPEWRITERS
Fritz Elbert, Munich, Germany, assignor to Robert Wolff, Basel, Switzerland
Application April 19, 1933, Serial No. 666,794
In Germany April 26, 1932
3 Claims. (Cl. 197—87)

1. In an escapement device for the paper carriage of typewriters, the combination comprising a powered ratchet wheel having teeth, a universal bar actuated by a key lever of said typewriter, a flat and plate-like detaining pawl rigidly mounted on said universal bar vertically to the direction of movement of said ratchet wheel teeth, a plate-like displacement pawl mounted on said universal bar at an angle to said detaining pawl whereby a tooth of said ratchet wheel will be engaged and retained by said detaining pawl in the normal position of rest of said universal bar, and said tooth will be released in a trigger-like manner and will slideably engage said displacement pawl and return said pawls and said universal bar into its initial position of rest after actuation of said bar by a key lever of said typewriter.

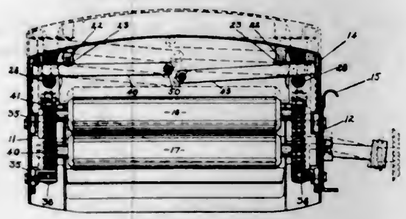


2,100,072
AIR CONDITIONING APPARATUS
Clarence W. Elber and Elmond J. Gerondale, Detroit, Mich.
Application June 4, 1936, Serial No. 83,411
3 Claims. (Cl. 98—94)

1. Air conditioning apparatus including an air chamber having axially aligned sections, a filter in each of said sections, means in one of said sections and between said filters for inducing the circulation of air through said filters, and means for adjusting the longitudinal position of one of said sections relative to the other of said sec-

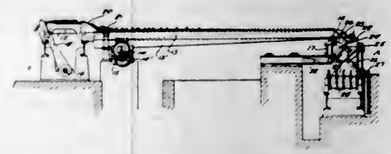
tions whereby said sections may be variably spaced.

2,100,073
ASHTRAY
Ernest W. Ekstrand, New Rochelle, N. Y., assignor to Ekstrand M'f'g Co., Inc., New York, N. Y.
Application July 17, 1935, Serial No. 31,791
1 Claim. (Cl. 131—51)



A tray of the character described formed to provide a circular bottom wall and an upstanding marginal annular wall, a vertical partition wall extending across the bottom wall between portions of the annular wall substantially at the transverse median line of the tray, a segment-shaped block integral with the bottom and annular wall with the straight side of the segment-shaped block spaced from and parallel to the partition wall and defining an elongated recess, a relatively thin zig-zag wall in the recess between the segment-shaped block and partition wall and integral with said block and wall, said zig-zag wall forming a plurality of cells triangular in plan view with opposite sides of each section of the zig-zag wall forming a wall of adjacent cells, said cells having a depth greater than the diameter of a cigarette, the circle circumscribed by each of the triangular contours having a diameter sufficiently greater than the diameter of a cigarette whereby an adjacent wall may support a cigarette at an acute angle relative to the vertical median line through a cell and said triangular cells being operative to reduce the amount of air admitted to the bottom thereof for positively extinguishing a cigarette.

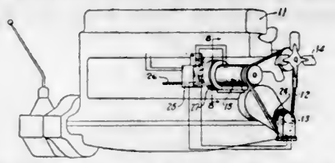
2,100,074
WRINGER RELEASE AND RESET MECHANISM
Nicholas L. Etten, Waterloo, Iowa, assignor to Chamberlain Corporation, Waterloo, Iowa
Application September 3, 1935, Serial No. 38,934
2 Claims. (Cl. 68—32)



1. A roll wringer mechanism including in combination a lower frame, a detachable upper frame,

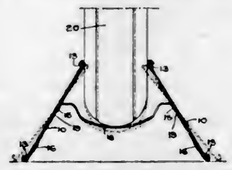
a lower roll mounted for vertical movement in the lower frame, pressure means normally forcing said roll upwardly, an upper roll supported by the top frame in position to force the lower roll downwardly when the top frame is held in position on the lower frame, means for releasably locking the upper frame on the lower frame comprising a cam surface sup-

ported in each end of the lower frame, a shaft disposed crosswise of the top frame at each end thereof, each carrying a cam co-operative with one of said cam surfaces of the lower frame and mechanism in the upper frame to rotate said cams to bring about locking relationship between said cam surfaces and cams to lock the upper frame upon the lower frame.



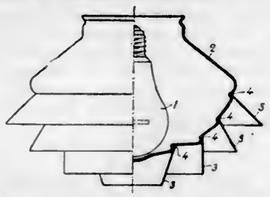
2,100,075
HANDLING ROLLED MATERIAL
Josef Gassen, Dusseldorf, Germany, assignor to Schloemann Aktiengesellschaft, Dusseldorf, Germany, a German corporation
Application August 21, 1935, Serial No. 37,123
In Germany June 14, 1934
3 Claims (Cl. 198—219)

1. In an apparatus for bundling cut rolled rods, and the like, the combination with a roller table adapted to receive the cut rods, of a shaking device, a means for successively transferring the rolled rods in separated groups from said roller table to said shaking device, and means for operating said shaking device so as to impart to the groups of rods a simultaneous oscillating and reciprocating motion, to cause the rods to assume a single layer, parallel relationship to each other on said shaking device and to be advanced gradually across said shaking device to a bundling station, said shaking device being constructed and arranged to operate to advance the rods across the same at progressively decreasing velocity whereby the rods are caused to collect with respect to each other as they approach the bundling station.



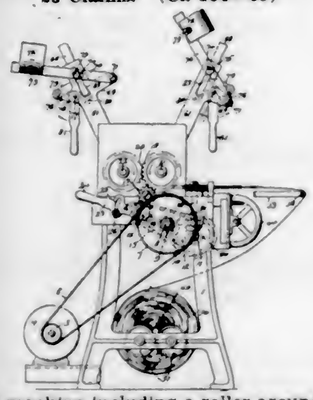
2,100,076
GENERATOR OPERATION
William E. Gilmore, Lyndhurst, N. J.
Application March 2, 1934, Serial No. 713,711
16 Claims. (Cl. 74—11)

1. In combination, a generator having an armature and a field, an over-running clutch, means for driving the armature through the clutch, and means for opening the circuit of the



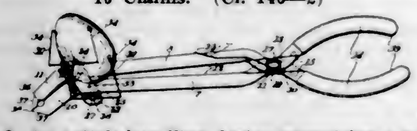
generator field during the desired operation of the over-running clutch.

2,100,077
DISPLAY DEVICE
Henry Harrison, Conshohocken, Pa.
Application May 1, 1935, Serial No. 19,163
2 Claims. (Cl. 248—174)



1. In combination, a holder comprising a pair of angularly adjustable elements having horizontally extending upper and lower edges, the lower edges thereof being adapted to rest upon a supporting surface, said elements being provided with embossed straps intermediate their upper and lower edges, and a yielding member having angularly directed end portions extending through said straps, to maintain said elements yieldingly in predetermined angular relation, said member being adapted to flex under the weight of an object supported thereby whereby to angularly shift said elements so that the upper edges thereof impinge against opposite sides of and support such object against tilting.

2,100,078
MULTIPLESHADE HOLDER
Poul Henningsen, Charlottenlund, near Copenhagen, Denmark, assignor to Louis Poulsen & Co., Copenhagen, Denmark
Application March 21, 1936, Serial No. 70,011
In Sweden April 4, 1935
1 Claim. (Cl. 240—108)

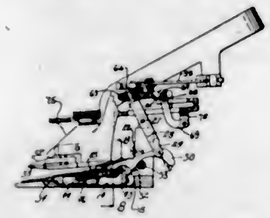


In a multiple shade holder of the character described, a glass holder of transparent or translucent material having a series of concentric annular grooves therein and a shade associated with each groove, the material forming the shades possessing the characteristic of shrinking when first moistened and then dried, whereby the shades will have their inner edges shrunk into the grooves of the holder.

2,100,079
CUTTING AND WINDING MACHINE
Oscar I. Judelshon, Park Ridge, N. J.
Application May 26, 1936, Serial No. 81,847
23 Claims. (Cl. 164—65)

23. A machine including a roller around a portion of which a strip of fabric is adapted to travel, an arbor on which the strip of fabric is adapted to be wound and to be propelled by said roller, inclined guiding members having tracks in which the ends of the arbor are guided to permit the arbor to move toward and from said roller, slides movable in said tracks and adapted to press said arbor towards said roller, levers having adjustable weights thereon, said levers pivotally supported by said guiding members and pivotally connected with said slides to exert downward pressure thereon, hand levers pivotally supported by said guides, links pivotally connected with said latter levers and said slides and operating to lock said weighted levers out of operation in raised position, subject to release by said hand levers.

2,100,080
UTENSIL
Frank P. Lackinger, McKees Rocks, Pa.
Application July 26, 1935, Serial No. 33,226
10 Claims. (Cl. 146—2)

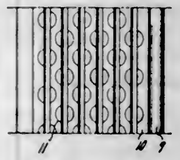


8. An article handling device comprising a pair of tong arms in pivotal relation forming handles and working ends, brackets mounted on the working ends, grasping fingers adjacent the outer side of the working ends held in position by said brackets, and means on said brackets adjacent the inner side of the working ends for piercing an article held by said fingers.

2,100,081
PROCESS FOR THE PRODUCTION OF PREPARATIONS CONTAINING THE ACTIVE CONSTITUENTS OF VEGETABLE PRODUCTS
Gerhard Madaus, Dresden, Germany, assignor to the firm Dr. Madaus & Co., Radebeul, Saxonia, Germany
No Drawing. Application May 23, 1935, Serial No. 23,072. In Germany February 4, 1935
2 Claims. (Cl. 167—82)

1. The process of producing preparations containing the active constituents of vegetable substances, which comprises triturating the fresh plants in the presence of honey, thereby preserving the volatile constituents of the fresh plants in the finished product.

2,100,082
HAIR CUTTING DEVICE
Joseph Mareska, Cicero, Ill.
Substitute for application Serial No. 588,061, January 22, 1932. This application February 6, 1936, Serial No. 62,597
10 Claims. (Cl. 30—208)

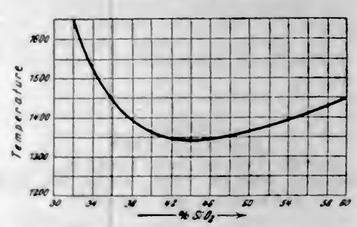


1. In combination with a pair of cutting members and their handles, a support secured to said cutting members, a gatherer carried by said support, means for reciprocating the gatherer, and means for guiding said gatherer during its reciprocation so that said gatherer moves in more than one plane relatively to said cutting members.

2,100,083
DISPENSING BOTTLE TOP
Nicholas S. Martin, Brooklyn, N. Y., assignor to No-Re-Fil Cap Corp., Brooklyn, N. Y.
Application November 30, 1936, Serial No. 113,488
4 Claims. (Cl. 215—25)

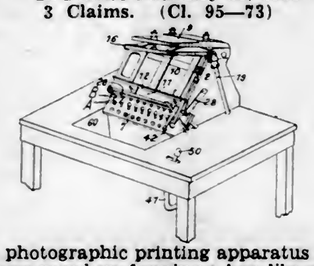
1. In combination a fluid container having a threaded nipple and a dispensing closure therefor comprising an apertured element within the bottle neck having an annular threaded lip overhanging the bottle top, a movable closure and a follower therefor within the apertured element; a resilient washer between the bottle top and the lip, an apertured washer on said lip, a movable pellet guide on said washer, a pellet within the guide, a cage for the pellet and pellet guide assembly, a movable fluid distributor embracing the cage, a guide for said distributor comprising a tapered annular body portion having an apertured outer end, and a threaded inner end with a shoulder adapted to clamp the washer and pellet cage, and an exterior tapered cap threaded at the top for a closure and at the bottom for the bottle neck and having a shoulder to clamp the dispensing closure as a whole to the bottle top.

2,100,084
PNEUMATIC TIRE TREAD
George K. McNeill, Detroit, Mich., assignor to United States Rubber Products, Inc., New York, N. Y., a corporation of Delaware
Application October 27, 1936, Serial No. 107,773
3 Claims. (Cl. 152—14)



1. A pneumatic tire comprising a carcass of strain resisting elements and a body of tread rubber composition, the road engaging portion of said tread composition being provided with grooves defining a plurality of circumferentially extending, functionally continuous ribs, said ribs being slit, without removal of substantially any of the rubber composition, into arcuate segments the chords of which lie in paths formed by the side walls of said ribs.

2,100,085
PRODUCTION OF VULCANIZED RUBBER
Henry O. Newman, Waterbury, Conn., assignor, by mesne assignments, to United States Rubber Company, New York, N. Y., a corporation of New Jersey
No Drawing. Application January 5, 1932, Serial No. 584,893
13 Claims. (Cl. 18—53)

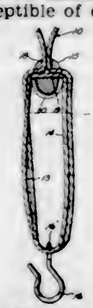


1. A process of producing vulcanized rubber which comprises incorporating with rubber a vulcanizing agent, an activatable type of organic accelerator and a substantially neutral salt of a diaryl guanidine and vulcanizing the rubber.

2,100,086
PROCESS FOR THE MANUFACTURE OF PIG IRON
Max Paschke, Clausthal-Zellerfeld, and Eugen Peetz, Duisburg-Huttenheim, Germany, assignors to H. A. Brassert & Co., Chicago, Ill.
Application March 28, 1935, Serial No. 13,508
In Germany March 29, 1934
4 Claims. (Cl. 75—41)

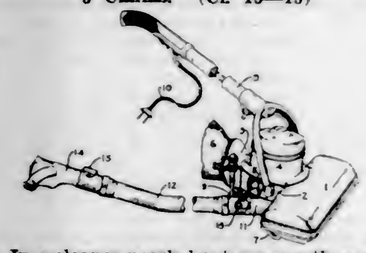
1. A process for the manufacture of pig iron which comprises charging a blast furnace with iron ore and sulphur containing coke and adding thereto slag-producing material in quantity such that an acid slag and a pig iron having a high sulphur content are produced, and reducing the quantity of sulphur in the pig iron after tapping from the furnace, by adding desulphurizing agents to the molten iron.

2,100,087
PHOTOGRAPHIC PRINTING MACHINE
Pierre Auguste Marcellin Priou, Chinon, France
Application February 19, 1936, Serial No. 64,713
In France February 28, 1935
3 Claims. (Cl. 95—73)



1. A photographic printing apparatus comprising frame members forming a box-like structure, a glass panel covering an aperture in the front upper portion of said structure and adapted to support a negative and a sheet of sensitized paper, a clip for holding the negative on said plate and an abutment bar for holding the sensitized sheet on the same plate, means for opening and closing said clip and moving said abutment bar, a horizontal pivot shaft upon the structure carrying a pressure plate normally held raised above said glass plate and capable of being lowered about said shaft to make contact with and resiliently press the negative and sensitized sheet on the glass plate, an electric printing lamp enclosed in said structure within said glass plate, a drive shaft, an electric motor for driving said shaft and connected in a circuit with said lamp, a control member fixed upon said shaft to rotate therewith, a switch for opening and closing the circuit of the motor, movable means for closing said switch, operated means for raising, at will, the clip and allowing insertion of a negative upon the glass plate, a plurality of similar movable manual means for initiating operation of the machine individually connected to a series of different resistances in the circuit of said lamp, intermediate means causing said movable means to close said switch upon operation of any one of the movable manual means in order to start said motor, rocking means pivoted upon the apparatus having a portion disposed in the path of said control member on said shaft and connected to said pressure plate so that rotation of the control member will cause movement of the pressure plate toward the glass plate, transmission means interposed between said motor and said drive shaft, and a movable contact member and a switch corresponding therewith for said lamp, said contact member being disposed in the path of movement of said rocking member so that operation of the latter to operate the pressure plate will cause said rocking member to move said contact member and close the switch of the lamp.

2,100,088
INSTRUMENT CORD
Albert Robertson, Milwaukee, Wis.
Application July 6, 1936, Serial No. 89,093
1 Claim. (Cl. 224—5)

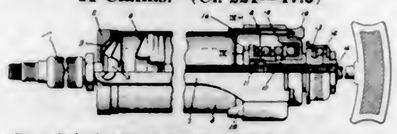


A sliding adjuster for looped instrument supporting cords, consisting of a bored block having plane surfaced opposite faces, the block having a T-shaped bore therein formed by a medially located transverse bore and a longitudinal bore extending from one end of the block to and communicating with the transverse bore, the exterior of the block having a groove extending from one end of the longitudinal bore to

the other end thereof and around the end of the block remote from the longitudinal bore, whereby the block may be bindingly adjusted on a cord which is susceptible of extension in doubled

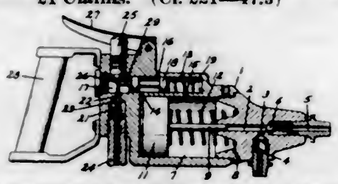
formation through the longitudinal bore with single strands passing in opposite directions through the transverse bore and into the groove and further looped and passed entirely through the transverse bore.

2,100,089
SUCTION CLEANER
Donald G. Smellie, Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio
Application May 23, 1935, Serial No. 22,941
5 Claims. (Cl. 15—13)



1. In a cleaner nozzle having a mouth, a second inlet into said nozzle, an unbalanced air turbine connected in series with said inlet and exhausting at a point spaced from said mouth, said turbine including an open-ended casing, means sealing said casing to said inlet, stationary guide vanes for air passing thru said turbine, rotors having blades to be contacted and rotated by the air directed thereagainst by said stationary guide vanes and an unbalanced mass to cause vibration upon rotation, means movably supporting said turbine in said nozzle and an agitator element connected to said turbine and extended into said nozzle mouth.

2,100,090
COSMETIC PRODUCTS
Fritz Sommer, Berlin-Charlottenburg, and Max Nassau, Berlin-Wilmersdorf, Germany, assignors to firm: Chemische Fabrik Grünau Landshoff & Meyer A. G., Berlin-Grunau, Germany, a company of Germany
No Drawing. Application September 18, 1935, Serial No. 41,024. In Germany September 20, 1934
15 Claims. (Cl. 167—90)

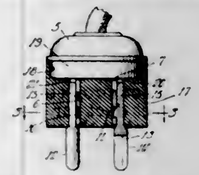


1. A cosmetic product containing albumen decomposition products of high molecular weight substituted at the nitrogen by higher fatty acid residues.

2,100,091
LUBRICATING DEVICE
Harry R. Tear, Evanston, Ill., assignor to The Lubrication Corporation, Chicago, Ill., a corporation of Delaware
Application February 3, 1936, Serial No. 62,057
11 Claims. (Cl. 221—47.3)

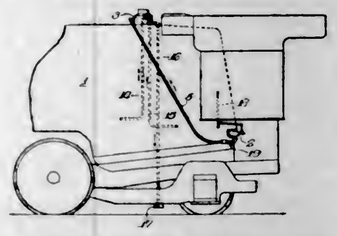
1. In a lubricating device, a lubricant pump, an interchangeable lubricant supply cartridge having a piston therein, means for detachably mounting said cartridge on said pump and for establishing lubricant communication between the pump and cartridge, cartridge piston operating mechanism including means pivotally connected to said pump and adapted to be swung about its pivotal axis into and out of alinement with the cartridge, and means carried by said pivotal means for engaging the cartridge to hold the pivotal means in alinement therewith.

2,100,092
LUBRICATING DEVICE
Harry R. Tear, Evanston, Ill., assignor to The Lubrication Corporation, Chicago, Ill., a corporation of Delaware
Application April 2, 1936, Serial No. 72,317
21 Claims. (Cl. 221—47.3)



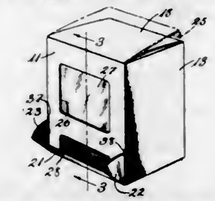
1. A lubricating device comprising, a lubricant pump having a piston mounted for reciprocation, a fluid motor having a piston mounted for reciprocation and directly connected to said pump piston, a control valve for controlling intake of fluid to and exhaust of fluid from said motor, said valve having an inlet and an exhaust position, resilient means for constantly urging said valve toward one of said positions, means to admit fluid pressure to one end of said valve to urge it to the other of said positions, and means controlled by operation of the motor to admit fluid pressure to the other end of the valve to balance the pressure thereon whereby said resilient means may return it to said one of its positions.

2,100,093
SMOKING PIPE
Joseph Torres, New York, N. Y.
Application July 24, 1936, Serial No. 92,301
4 Claims. (Cl. 131—12)



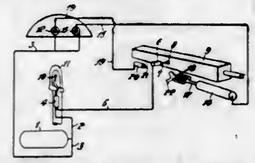
1. In a smoking pipe, a bowl, a stem extending from the bowl, provided with a transverse opening intermediate and in communication with a smoke passage from the bowl and a smoke passage to the free end of the stem, a removable plug in said opening comprising a porous element intermediate perforated resilient walls of nonporous material; the perforations of each of said walls being in continuity and alignment respectively with proximate ends of the smoke passages, whereby smoke drawn from the bowl through the passages in the stem will travel through the plug prior to its emission from the free end of the stem.

2,100,094
ELECTRIC CORD PLUG ADAPTER
Leo J. Wahl, Sterling, Ill., assignor to Wahl Clipper Corporation, Sterling, Ill., a corporation of Illinois
Application February 19, 1936, Serial No. 64,704
5 Claims. (Cl. 173—344)



2. An adapter for electric cord plugs of the type having spaced parallel prongs, said adapter comprising a body of resilient material having spaced openings extending through the body, one end of each opening being adapted to receive one of the prongs of a plug, auxiliary prong members having shank portions entering the body at the other end of said openings, and adapted to establish electrical contact with the plug prongs in the openings, said auxiliary prong members having prong portions projecting from the body and adapted to seat in a socket, said prongs being held in place by the pressure of the resilient body thereon, the shanks of the auxiliary members and the prongs of the plugs having cooperative interlocking portions.

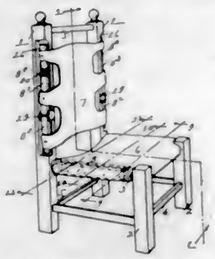
2,100,095
LOCOMOTIVE STEAM SEPARATOR
Lyndon F. Wilson, Chicago, Ill., and Richard J. Williams, Detroit, Mich., assignors to Wilson Engineering Corporation, Chicago, Ill., a corporation of Delaware
Application July 1, 1936, Serial No. 88,330
2 Claims. (Cl. 122—382)



2. The combination of a locomotive provided with a blow-off valve and with one or more steam operated auxiliaries, of a separator comprising a cylindrical shell mounted in vertical position upon the locomotive and provided with an internal, horizontally disposed baffle and an upwardly extending steam delivery throat, a pipe leading from the blow-off valve and connected to said shell so as to deliver blow-off steam and water tangentially into the shell, an exhaust steam pipe leading from said auxiliaries and connected to said shell to deliver exhaust steam tangentially thereto, said exhaust steam pipe being so connected to the shell in proximity to the path of the blow-off products delivered by said blow-off valve to the shell that said blow-off products prevent the production of a back pressure in said exhaust steam pipe, and a discharge pipe connected with the lower portion of said shell through which the liquid separated in said shell from the steam is discharged tangentially from said shell.

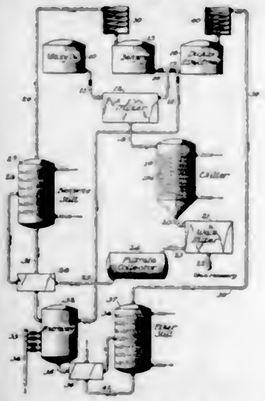
2,100,096
DISPENSING CONTAINER
James R. Bedell, Cuyahoga Falls, Ohio, assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York
Application July 7, 1936, Serial No. 89,333
1 Claim. (Cl. 206—31)

A container formed of one piece of sheet material and comprising a collapsible box-like structure having a back panel, a bottom panel and two side panels hinged thereto, a front panel integral with and hinged to one of the side panels and having a glue flap adapted to be attached to the other side panel, said front panel having a dispensing opening narrower than the panel and a pair of guide slots spaced laterally therefrom and extending to its lower margin so as to define with said opening a pair of panel-supporting legs adapted to be supported from the bottom panel, said bottom having a dispensing hopper hinged thereto with arcuate end tabs formed for limited sliding engagement in said slots, said side panels being formed with interlocking means and being adapted to be locked together beneath said bottom panel so as to support the bottom against sagging, said container being formed with integral means for closing its upper end.



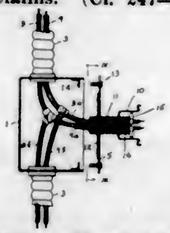
2,100,097
MACHINE GUN FIRE CONTROL APPARATUS
George Edward Beharrell, Streetly, Joseph Wright, Coventry, and Henry Trevaskis, Sutton Coldfield, England, assignors to Dunlop Rubber Company, Limited, London, England, a British Company
Application March 12, 1936, Serial No. 68,404
In Great Britain March 6, 1935
7 Claims. (Cl. 89—27)

1. Pneumatic cocking means for rapid firing small arms having a recoiling breech block and



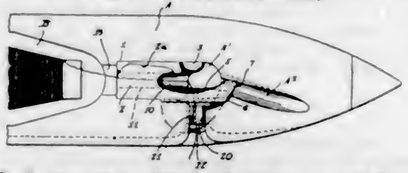
gun firing trigger, which comprises a pneumatic cylinder and piston, a valve to control the admission of air to said cylinder, a detent movable with said piston and a member extending from said breech block and engaged by said detent during the outward stroke of the piston, said detent being displaceable to release said member, a catch mounted on said detent and a spring actuated latch engaged by said catch to hold said catch and said recoil member at the end of the outward stroke of the piston.

2,100,098
CHAIR
Henry E. Bennett, Grand Rapids, Mich.
Application March 13, 1936, Serial No. 68,588
6 Claims. (Cl. 155—179)



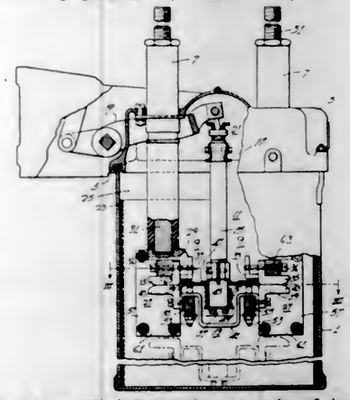
1. In a chair, in combination: a base; a yielding support for the occupant comprising a flexible sheet member and a pair of elongated comparatively rigid members extending approximately parallelly with the lateral sides of the chair, in supporting relation with the sheet member adjacent its lateral edges parallel therewith and pivotally mounted at one end for yielding inwardly swinging movement.

2,100,099
REFINING LUBRICATING OIL WITH DICHLOROETHYL ETHER
Clifford C. Buchler and James M. Page, Jr., Casper, Wyo., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application March 10, 1932, Serial No. 597,890
15 Claims. (Cl. 196—19)



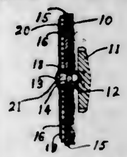
15. A process of dewaxing oils, which comprises incorporating with the oil beta beta-dichlorodiethyl ether, chilling, and separating the wax.

2,100,100
ELECTRICAL DUCT FEED
Martin M. Clayton, Baden, Pa., assignor to National Electric Products Corporation, a corporation of Delaware
Application May 22, 1936, Serial No. 81,204
5 Claims. (Cl. 247—3)



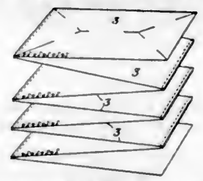
1. In combination with an elongate multiple outlet duct an outlet box having in a wall thereof an elongate opening for the reception of a take-off connector, connector-engaging means associated in the outlet box along the connector-receiving opening therein, and a hollow take-off connector adapted for projection through a wall of the multiple outlet duct for leading conductors thereinto and for entry through the wall opening of the outlet box, said hollow connector having exteriorly thereof means cooperative with the connector-engaging means of the outlet box adapted in various adjusted positions of the connector along the wall opening of the outlet box selectively to engage the connector and the multiple outlet duct in one dimension limited by the length of the outlet box wall opening.

2,100,101
LOOM SHUTTLE
James T. Curboy, Southbridge, Mass., assignor to Albert E. Leon, Belmont, Mass.
Application May 25, 1934, Serial No. 727,458
3 Claims. (Cl. 139—223)



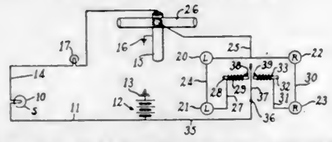
1. A one-piece shuttle threader of rigid cast metal whose rearward half has an upward extension of substantially quadrantal contour transversely of the base forming a downwardly curved bridge, whose rear end is convexly rounded, arching across a medial longitudinal cylindrical bore and separated along its lower side from the underneath marginal portion of the base to provide an elongated entrance slot below the transverse diametrical plane of the bore between top and bottom substantially parallel edges in a lengthwise direction of the threader for a substantially greater distance than the diameter of said bore, the forward portion of said base being formed with a trough-like passage open at its top and forming a continuation of said laterally slotted cylindrical bore, said passage being bounded on one side by an upstanding yarn guiding lug located at the forward end of the base and in forward alignment with, but well spaced from, the forward end of said slot, and an elevated yarn guiding beak bounding the opposite side of said passage and having a convexly curved top converging forwardly to a vertically depending tip located in axial alignment with said bored passage.

2,100,102
CIRCUIT BREAKER
Lloyd W. Dyer, Swissvale, and Gayne D. Gamel, Wilkinsburg, Pa., assignors to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application March 8, 1935, Serial No. 10,000
9 Claims. (Cl. 200—146)



1. In a circuit interrupter, a pair of terminal members, and bridging means movable into and out of engagement therewith, each of said terminal members having a solid main contact rigidly supported thereon and a solid arcing contact rigidly supported thereon, said bridging means including a rigid bar member of conducting material having solid contact portions rigidly mounted thereon for engaging said main contacts, a second substantially rigid bar member of conducting material having solid contacting portions rigidly secured thereto for engaging said arcing contacts, and a common actuating member for said rigid bar members, a resilient connection between said actuating member and said first bar member, and a lost motion connection between said bar members, said lost motion connection enabling said contacts to open in a predetermined sequence.

2,100,103
BUTTON BACKER
Sarah Ann Harrison, Omaha, Nebr.
Application December 3, 1934, Serial No. 755,711
Renewed October 9, 1937
4 Claims. (Cl. 24—90)

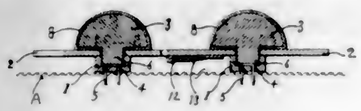


1. In combination with a garment and a button, a button backer for securing the button to the garment, said button backer comprising a piece of fabric and having a plurality of reinforced holes adjacent the center thereof, a strip of tape for tying said button to the button backer, said tape being threaded to the button and through the reinforced holes of the button backer, tied, and the ends thereof sewed to the button backer, and means for securing the button backer to the garment over a wide area surrounding the point of attachment of the button to the garment.

2,100,104
MANUFACTURE OF MATTRESSES
James Reid Johnson, New London, Conn., assignor to The Palmer Brothers Company, New London, Conn., a corporation of Connecticut
Application January 10, 1936, Serial No. 58,524
7 Claims. (Cl. 5—345)

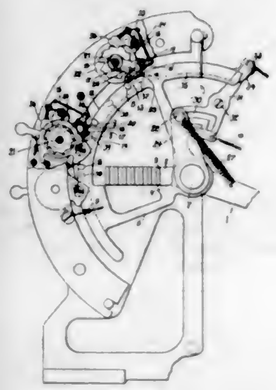
1. In the method of making a mattress the steps of preparing a plurality of disconnected similar oblong panels, having ornamented faces exemplifying a closed design and each sufficiently large to form the top or bottom of a mattress; assembling a plurality of the panels in superimposed pairs alternately face to face and back to back; sewing together the adjacent ends of the second panel of each pair and the first panel of the next pair; and sewing together successively the other ends of each pair of panels, to unite the panels in a continuous strip; assembling the continuous strip with a continuous bat and backing; cutting the assembly into panel lengths approximately on the lines of juncture of the panel sections; assembling the panels in pairs with a boxing to form mattress casings, and inserting cores therein.

2,100,105
SIGNAL FOR AUTOMOBILES
Albert C. Lee and William Lee, New Haven, Conn.
Application December 26, 1934, Serial No. 759,144
7 Claims. (Cl. 177—339)



3. In a signal device for vehicles comprising a tube, means supporting said tube on the frame of the vehicle, said tube being in an inclined position, a signal, an electric circuit leading to the signal and having spaced contacts in the lower end of said tube, a conducting liquid in said tube adapted to remain at the lower part thereof upon motion of said vehicle in a given direction and to be moved toward the elevated end of the tube upon a change in the direction of motion of said vehicle to make and break the circuit through said signal, a manually operated switch to close said circuit when said conducting liquid is in circuit-making position, said switch comprising a member normally urged to a neutral position, and magnetic means to hold said switch in closed position after manual movement of the switch to said position.

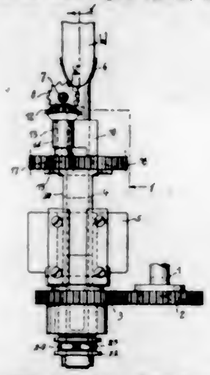
2,100,106
BUTTON AND CLASP CONSTRUCTION
Josuke Matsumoto, Los Angeles, Calif.
Application July 24, 1936, Serial No. 92,402
In Japan October 8, 1935
8 Claims. (Cl. 24—230)



1. In a clasp, a pair of buttons having cup shaped bodies adapted to be secured to a garment, heads removably engaged in said bodies,

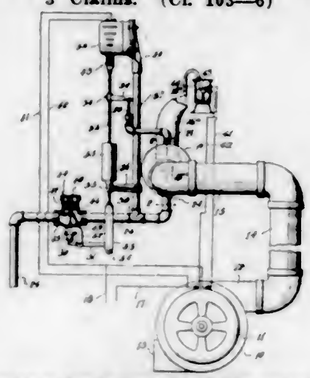
base plates between said heads and said bodies and extending therefrom into interfitted rela-

tion to one another, and cooperating clasp elements on the under sides of said plates.



2,100,107
COUNTER SELECTING AND OPERATING MEANS
William L. Paden, Dayton, Ohio, assignor, by mesne assignments, to Central National Bank of Cleveland, Cleveland, Ohio, as trustee
Application November 2, 1934, Serial No. 751,175
10 Claims. (Cl. 235—6)

1. In a register, a plurality of counters, a selector plate provided with notches and a groove, a slide provided with notches mounted in the groove, the notches in the plate being differentially spaced apart and the notches in the slide being equally spaced apart, means to move the slide so as to bring one of the notches of the slide into alignment with one of the notches of the plate and to move the plate and slide beyond the point where the notches were brought into alignment, and means connected to the counters to engage the two notches in alignment and upon the last-named movement of the plate and slide to operate the selected counter.

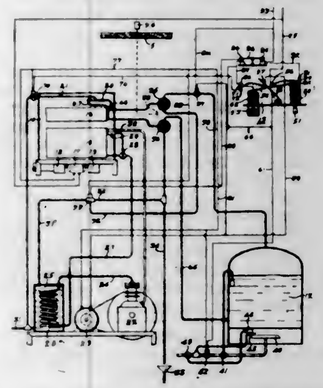


2,100,108
CIGAR BUNCH TRIMMER
Constantin Friedrich Röber, Dresden, Germany, assignor to "Universelle" Cigarettenmaschinenfabrik J. C. Mueller & Co., Dresden, Germany
Application August 20, 1935, Serial No. 36,944
In Germany August 27, 1934
8 Claims. (Cl. 131—39)

1. A device for removing the annular projection on the mouth piece ends of cigar fillers incident to the clipping of the twisted wrapper end therefrom, comprising a milling cutter, means for supporting the milling cutter against the said annular projection of the cigar filler, and means for

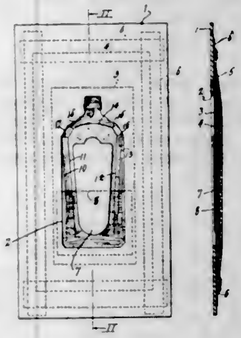
moving the milling cutter while turning said cutter around the axis of the cigar filler.

2,100,109
DOMESTIC WATER SYSTEM
William H. Ryan, Newburgh, N. Y.
Application April 17, 1936, Serial No. 74,839
3 Claims. (Cl. 103—6)



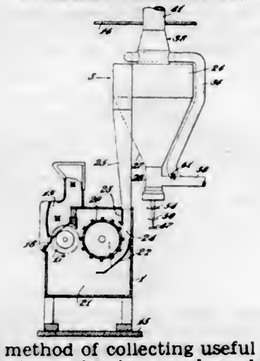
1. A means for automatically supplying air to a water system having an electrically operated pump, comprising a casing adapted to be interposed in the system on the outlet side of the pump, an air intake means connected to the casing, a drain pipe connected to the casing, a spring pressed valve in the air intake means, a spring pressed valve in the drain pipe, means engaging each of said valves for moving said valves to open position when the pump is inoperative, and means engaging said latter means for disengaging said latter means from the valves when the pump is operative.

2,100,110
AIR CONDITIONING
Nelson J. Smith and Jewel C. Chambers, Dayton, Ohio, assignors, by mesne assignments, to General Motors Corporation, a corporation of Delaware
Application June 30, 1933, Serial No. 678,388
18 Claims. (Cl. 257—3)



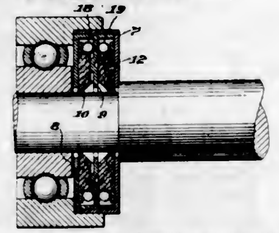
1. In an air conditioning apparatus, an enclosure, the air of which is to be conditioned, an air cooling refrigerant evaporating chamber

for said enclosure, a refrigerant liquefying unit for supplying refrigerant to said evaporating chamber, said refrigerant liquefying unit being cooled by a fluid, tempering means for tempering the air cooled by said evaporating chamber by heat exchange with said fluid, a boiler, means



for automatically controlling the operation of said tempering means in accordance with air conditions of said enclosure, and means for connecting said tempering means to said boiler automatically in accordance with atmospheric conditions.

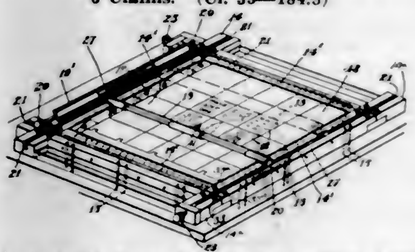
2,100,111
DISPLAY SIGN
Fred Stonebraker, Sr., San Diego, Calif., assignor, by direct and mesne assignments, to Illustigraph Corporation, San Diego, Calif., a corporation of California
Application June 29, 1936, Serial No. 87,844
5 Claims. (Cl. 40—126)



1. A sign comprising a sheet of transparent material framed in the outline of a translucent body to be simulated, which body has an irregular surface of substantial depth, in combination with a reflector positioned back of said sheet of transparent material for reflecting light through said sheet, in which said reflector has surface irregularities therein to simulate the irregularities in the surface of the body and said transparent sheet has shading thereon juxtaposed to irregularities of said reflector.

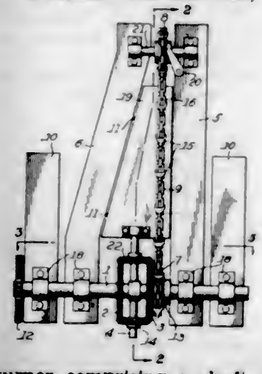
2,100,112
METHOD OF COLLECTING LINT
Dick Taylor, Paris, Tex., assignor to Southland Cotton Oil Company, Paris, Tex., a corporation of Texas
Original application June 5, 1936, Serial No. 83,650. Divided and this application February 24, 1937, Serial No. 127,462
3 Claims. (Cl. 19—72)

1. That method of collecting useful lint from a battery of gin mechanisms each so devised as to deliver a lint carrying air current, said method comprising as steps keeping the lint and accompanying dust in air suspension and, while they are in air suspension, separating the useful lint from dust in accordance with the relative masses of the lint and dust particles, dividing the air current into two streams, in one of which the major part of the lint is suspended and in the other of which the major part of the dust is suspended, conducting each dust-laden air stream to a point of discharge remote from the gin mechanism, conducting the several lint-laden air streams away from the respective gin mechanisms, merging said lint carrying air streams, and separating the useful lint from the air after merger of said streams.



2,100,113
GREASE RETAINER
Edward P. Travis, Floral Park, N. Y., assignor, by mesne assignments, to Chicago Rawhide Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application February 3, 1933, Serial No. 655,039
1 Claim. (Cl. 288—1)

A grease retainer for bearings comprising an annular casing, two annular fibrous washers mounted in said casing, said washers having flat walls bearing against the outer walls of said casing, whereby the casing affords lateral support for said washers adjacent to the inner edges of the washers, the inner margins of said washers adjacent to each other being bevelled to provide thin inner edges thereon for engagement with the shaft on which the device is to be used, springs

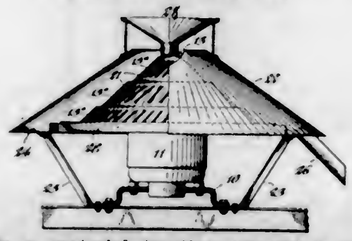


acting on the outer edges of said washers to contract them radially, a partition separating said washers, and lugs on said partition entering recesses in said washers to prevent the washers from revolving relatively to the casing.

2,100,114
ART OF LINING UP PRINTED MATTER AND REGISTERING TYPE
John P. Walsh, Boston, Mass.
Application March 23, 1935, Serial No. 12,625
6 Claims. (Cl. 33—184.5)

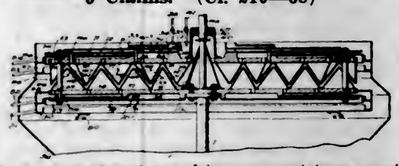
1. A combination lock-up and line-up frame for use in lining and squaring up printing elements in a chase on an imposing stone without removing either the chase or the frame from the imposing stone, comprising graduated rails adapted to be assembled as a frame and fastened to the imposing stone in enclosing relation to the chase, a double-edged straight edge member mounted on said frame for both sliding and tilting movements relative to the chase and provided with graduations along both of its edges which are readable with reference to the graduations of the frame rails accordingly as said straight edge member is tilted to bring a selected edge thereof into juxtaposition to the chase, and means for releasably locking the straight edge member in tilted position without interfering with the sliding movements thereof over the chase.

2,100,115
LOG TURNER
Benjamin O. Ward, Valle Crucis, N. C.
Application June 16, 1937, Serial No. 148,557
1 Claim. (Cl. 143—102)



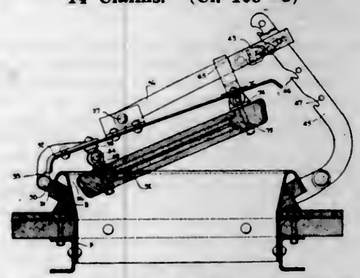
A log turner comprising a shaft, means for rotatably supporting the shaft, a pinion keyed to the shaft, a second pinion, like the first, with a sprocket wheel fastened to it, rotatably mounted on the shaft, planetary gearing rotatably mounted on a cross-shaft and meshing with the two pinions, the planetary gearing being fastened to two beams which are rotatably mounted on the shaft one on one side of the two pinions and the other on the other side, a second sprocket wheel mounted as an idler at the other end of the beams in line with the first sprocket wheel, an endless chain with hooks attached to it running on the two sprocket wheels, a track supported by the two beams between the two sprocket wheels on the front side so as to force the hooks firmly against the log, a brake on the idler sprocket wheel to furnish enough friction to lift the beams when the shaft is turned toward the log, whereby when the chain strikes the log the beams stop and as the shaft turns on, carrying with it the pinion keyed to it and as the planetary gearing that is secured to the beams that support the idler sprocket wheel and chain also stop then the rotatably mounted pinion and sprocket wheel turn in an opposite direction carrying the chain with its hooks up against the log forcing it to turn; power being applied to the shaft by a spur gear and pinion connected to power transmission means; the beams with the idler sprocket wheel returns to a horizontal position when the shaft is turned in a reverse direction so that logs may be rolled over it to the carriage.

2,100,116
METHOD AND APPARATUS FOR TREATING PYORRHEA
George Farrell Webb, Kansas City, Mo.
Application September 5, 1935, Serial No. 39,266
4 Claims. (Cl. 128—303.17)



1. In a method of treating pyorrhea the steps of successively subjecting small areas of unattached gingival margin to the action of a high frequency current.

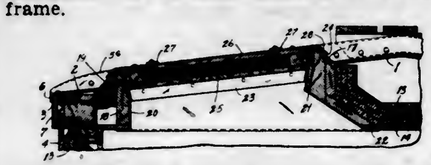
2,100,117
APPARATUS FOR TREATING MATERIALS
William L. Wettlaufer, Buffalo, N. Y.
Application January 22, 1935, Serial No. 2,913
Renewed October 12, 1937
4 Claims. (Cl. 210—68)



1. In a material treating apparatus of the character described, a centrifugal separating drum open at its upper and lower ends for the feed and discharge of material to and from the same, flanges disposed substantially radially about said drum and extending inwardly from the walls thereof, and baffle means disposed within said drum in superposed spaced relation to provide a plurality of separating zones, said baffle means abutting at their peripheries with the opposing edges of said flanges and adapted to intercept and direct the material outwardly from the lower end of one zone to the upper end of an adjoining zone, said drum having discharge slots in the zone areas thereof for the discharge of water and like matter separated from the material undergoing treatment.

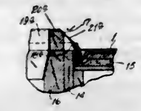
2,100,118
SEPARATING LIQUIDS FROM SOLIDS AND APPARATUS THEREFOR
Nathaniel R. Andrews, Yonkers, N. Y.
Application February 27, 1936, Serial No. 66,125
6 Claims. (Cl. 210—68)

1. A centrifugal machine comprising a rotatable shaft, two spaced parallel plates mounted on said shaft, two spaced annular sheets corrugated in circles mounted between said plates and so disposed as to provide a sinuous radial passage therebetween for material to be separated, peripherally disposed faces of the corrugations of said corrugated sheets being foraminous in order to provide outlets for liquids from said sinuous passage, means for feeding material centrally into said sinuous passage and means for collecting separated liquids and solids.



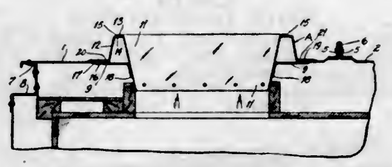
2,100,119
HATCH FOR RAILWAY CARS
Walter C. Stone, St. Louis, Mo.
Application December 9, 1936, Serial No. 115,046
14 Claims. (Cl. 108—5)

3. A railway car having a roof and spaced carlines below the roof in combination with a hatch frame having substantially vertical portions secured to said carlines and outwardly flared portions above the plane of said roof forming a hatch plug seat, and means to insulate the portion of the hatch frame above the plane of the roof.



2,100,120
HATCH CONSTRUCTION
Charles David Bonsall, Pittsburgh, Pa., assignor to P. H. Murphy Company, New Kensington, Pa., a corporation of Pennsylvania
Application July 25, 1935, Serial No. 33,041
Renewed May 11, 1936
12 Claims. (Cl. 108—5)

1. A hatch construction for car roofs comprising a wooden hatch frame having a portion extending above the body portion of said roof, a roof sheet having an integral portion thereof pressed upwardly to form a hollow upstanding boss therein that covers said portion of said hatch frame and has a hatch opening cut in its top, and a metal hatch frame mounted in said wooden hatch frame.



7. A roof sheet for a car roof, said roof sheet being made of rolled metal having an upstanding boss pressed therein integral therewith, said boss having a portion cut from the top thereof forming a hatch opening therein.

2,100,121
HATCH CONSTRUCTION
Charles David Bonsall, Pittsburgh, Pa., assignor to P. H. Murphy Company, New Kensington, Pa., a corporation of Pennsylvania
Application December 4, 1935, Serial No. 52,759
8 Claims. (Cl. 108—5.4)

1. A hatch construction for car roofs comprising a hatch sheet provided with a hatch opening having an upstanding flange along the margin thereof and a metal hatch frame having a portion located in said opening and a portion extending above said flange and provided at its upper end with a marginal flange that is rigidly secured flatwise to the flange of said hatch sheet, the flange of said metal hatch frame being inclined downwardly and outwardly therefrom and the hatch sheet flange being inclined upwardly and inwardly at a corresponding angle from the margin of said opening.

2,100,122
HATCH CONSTRUCTION
Paul E. Finger, New Kensington, Pa., assignor to P. H. Murphy Company, New Kensington, Pa., a corporation of Pennsylvania
Application April 11, 1936, Serial No. 73,954
16 Claims. (Cl. 108—5)

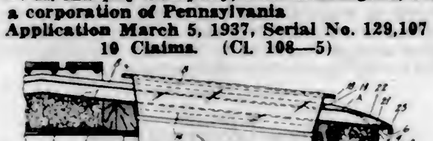
2. A hatch construction for car roofs comprising a roof sheet provided with a hatch opening and a metal hatch frame having a hopper portion located in said opening and a depending rim portion terminating at its lower end in an outstanding flange that extends beneath said roof sheet around the margin of the hatch opening therein.

2,100,123
HATCH CONSTRUCTION
Charles David Bonsall, Pittsburgh, Pa., assignor to P. H. Murphy Company, New Kensington, Pa., a corporation of Pennsylvania
Application April 13, 1936, Serial No. 74,218
16 Claims. (Cl. 108—5.4)

1. A hatch construction for a car roof comprising a roof sheet provided with a hatch opening having an upstanding flange along the margin thereof, and a self-contained metal hatch frame extending downwardly through said opening and upwardly above the general level of said roof sheet, members rigid with said roof and disposed in abutting relation to the inner side face of said upstanding flange, and means for rigidly securing the upper margin of said upstanding flange to the margin of the upwardly extending portion of said metal hatch frame.

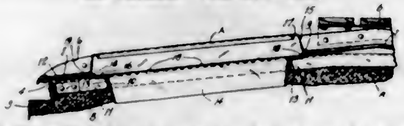
2,100,124
HATCH CONSTRUCTION
Garth G. Gilpin, Riverside, Ill., assignor to P. H. Murphy Company, New Kensington, Pa., a corporation of Pennsylvania
Application August 13, 1936, Serial No. 95,790
26 Claims. (Cl. 108—5.4)

10. A hatch construction for a car roof comprising a roof sheet provided with a hatch opening and an upstanding flange surrounding said opening, a metal hatch frame having a closed hollow rim portion fitting in said opening, means for securing said flange to said rim portion, and a filler of heat insulating material enclosed in said rim portion.



24. As an article of manufacture, a roof sheet and insulated metal hatch frame assembly adapted for application to a car roof as a complete preassembled unit, said roof sheet having a hatch opening therein and said hatch frame being disposed in said hatch opening and having a closed box-like hollow rim portion having a weatherproof connection with said sheet around said hatch opening.

2,100,125
HATCH CONSTRUCTION
Garth G. Gilpin, Riverside, Ill., assignor to P. H. Murphy Company, New Kensington, Pa., a corporation of Pennsylvania
Application October 28, 1936, Serial No. 107,923
10 Claims. (Cl. 108—5.4)

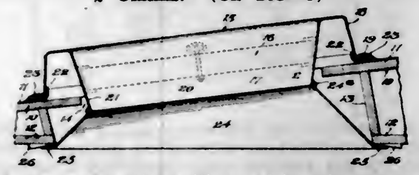


1. A hatch construction for a car roof comprising a metal hatch frame having a portion extending above the general level of the roof and provided with an inwardly opening channel, and heat insulating material mounted in said channel.

2,100,126
HATCH CONSTRUCTION
Charles David Bonsall, Pittsburgh, Pa., assignor to P. H. Murphy Company, New Kensington, Pa., a corporation of Pennsylvania
Application September 14, 1936, Serial No. 100,624
10 Claims. (Cl. 108—5.4)

1. A car roof construction comprising a roof sheet having a hatch opening therein, a hatch frame disposed in said opening and having an exterior downwardly opening rim portion with the lower edge of its outer wall located adjacent to the edge of said opening, a closure plate for said hollow rim portion cooperating therewith to form a closed hollow box-like section, and a continuous watertight rigid joint between said edge of said outer wall and the edge of said hatch opening.

2,100,127
HATCH CONSTRUCTION
Charles David Bonsall, Pittsburgh, Pa., assignor to P. H. Murphy Company, New Kensington, Pa., a corporation of Pennsylvania
Application February 6, 1937, Serial No. 124,365
12 Claims. (Cl. 108—5.4)

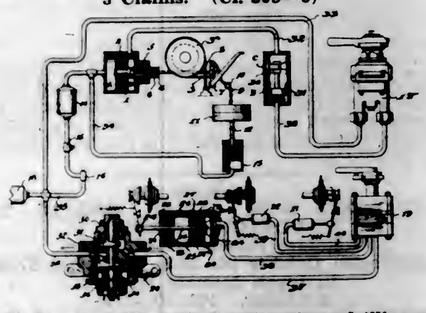


1. In a hatch construction for car roofs, a roof sheet provided with a hatch opening, a metal hatch frame for said opening comprising upper and lower body sections, said lower body section being located entirely below said roof sheet and said upper body section having its lower portion disposed in said hatch opening and seated on said lower body section, and a continuous weld securing said upper and lower body sections and said roof sheet together around said hatch opening.

2,100,128
HATCH CONSTRUCTION
Victor E. West, New Kensington, Pa., assignor to P. H. Murphy Company, New Kensington, Pa., a corporation of Pennsylvania
Application March 5, 1937, Serial No. 129,107
10 Claims. (Cl. 108—5)

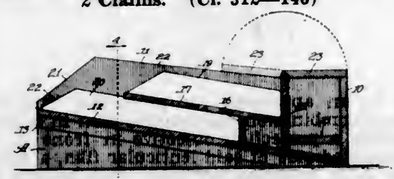
1. A car roof having a hatch opening therein and a member superimposed on said roof and extending from eaves to eaves thereof, said member having a hatch frame rigid therewith registering with said hatch opening.

2,100,129
HATCH FRAME
Louis C. Wilkoff, Youngstown, Ohio, assignor, by mesne assignments, to P. H. Murphy Company, a corporation of Pennsylvania
Application February 7, 1936, Serial No. 62,856
2 Claims. (Cl. 108—5)



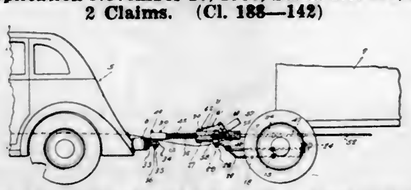
1. In combination with a refrigerator car and the like having a roof and ceiling spaced therefrom, an opening in said roof and ceiling, and a relatively heavy, rigid hatch frame positioned in said opening and including a one piece metal well having downwardly sloping side and end walls positioned within said roof and ceiling openings, and spaced from the walls thereof, and means for connecting the hatch frame to the roof at points spaced from the roof to provide a watertight imperforate joint therebetween.

2,100,130
HATCH CONSTRUCTION
Charles David Bonsall, Pittsburgh, Pa., assignor to P. H. Murphy Company, New Kensington, Pa., a corporation of Pennsylvania
Application September 4, 1937, Serial No. 162,414
10 Claims. (Cl. 108—5.4)



1. A hatch construction for a railway car comprising a non-metallic hatch frame, an insulated hatch plug, and a metallic hatch frame or liner fitted in said main frame and cooperating therewith to form the outer end portion only of a seat for said hatch plug.

2,100,131
DISTANT PNEUMATIC CONTROL FOR A DRILLING RIG
Matvey Alcunovitch Capeliushnicoff and Semien Lvovitch Zalkin, Baku, Union of Soviet Socialist Republics
Application December 3, 1934, Serial No. 755,842
In Union of Soviet Socialist Republics November 28, 1933
3 Claims. (Cl. 303—6)



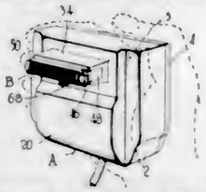
1. A pneumatic control system for a drilling rig comprising a rotatable member and a brake member adapted to be applied to or released from said rotatable member, a brake cylinder, a piston in said cylinder dividing the latter into two chambers, means connecting said piston with said brake member, an air reservoir, means including a regulating device, and a non-return valve for maintaining the pressure in said reservoir at a predetermined value, and means connecting said reservoir with one of said chambers whereby the piston is subjected to a predetermined air pressure constantly acting through said connecting means to apply said brake member.

2,100,132
COMMODITY DISPLAY CABINET
Edward D. Davis, Chicago, Ill., assignor to The Boye Needle Company, Chicago, Ill., a corporation of Illinois
Application March 25, 1935, Serial No. 12,918
2 Claims. (Cl. 312—146)

1. In a display cabinet of the character set forth, a case, walls providing a transverse compartment at the rear of said case, a floor extending forwardly from said compartment and upwardly toward its free end, and a swing door carried by said case and adapted to be swung to one position in which it closes said compartment and also to another position in which it covers the rear portion of said floor.

2,100,133
TRAILER HITCH AND BRAKE ACTUATOR
Jodie T. Dixon, Luxora, Ark.
Application November 16, 1936, Serial No. 110,143
2 Claims. (Cl. 188—142)

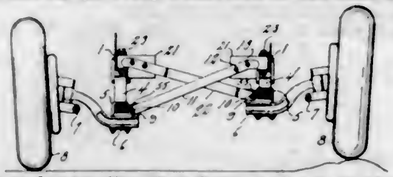
2. Coupling apparatus for use on a trailer having steering mechanism and brake mechanisms, respectively, said apparatus comprising an elongated bar adapted to be pivotally connected with the axle of the trailer at a point between the ends of said bar, a plate pivotally connected to one end of the bar, a guide block fixedly secured to the plate, a draft rod having a sliding fit through the guide block and provided at one end with means for connecting it to a draft vehicle, said means embodying an abutment, a rod secured at one end to the rear end of the first-mentioned bar and operatively connected to said steering mechanism for transmitting turning movement of the first-mentioned bar to said steering mechanism, and thereby steering the trailer, a spring disposed about the draft rod and having one end bearing against said abutment and a relatively opposite end bearing against said guide block, means operatively connecting the draft rod with said brake mechanism for applying the brakes upon a push being



exerted upon the draft rod, and means connected with said guide block and adapted to be engaged with the draft rod for arresting movement of the draft rod relative to the guide block in one direction, whereby to preclude an application of the wheel brakes when desired and incidental to the backing up of the vehicles.

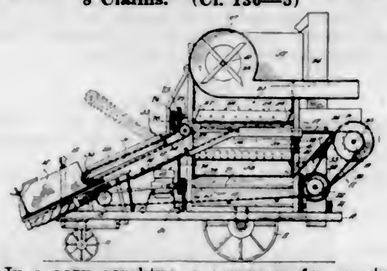
2,100,134
APPARATUS FOR PROJECTING LENTICULAR FILM
John Eggert, Leipzig-Gohlis, and Gerd Heymer, Wolfen Kreis Bitterfeld, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
Application November 24, 1934, Serial No. 754,656
In Germany November 25, 1933
2 Claims. (Cl. 88—16.4)

1. In an apparatus for projecting lenticular film in combination, a lenticular film in a plane position, a projection objective in front of the lenticulated side of said lenticular film, a multi-color filter arranged in front and beyond the focus of said objective with its color strips parallel to the lenticular elements, said objective and said multi-color filter being arranged at distances from said lenticular film so as to project in co-operation a real image of said multi-color filter opposite the emulsion side of said lenticular film with the images projected by the single lenticular elements in register with the like parts of the color filter record of the lenticular film, and simultaneously to project said film.



2,100,135
ELECTRIC DRY SHAVER
Irving Florman, New York, N. Y.
Application May 27, 1936, Serial No. 82,106
6 Claims. (Cl. 30—43)

6. An electric dry shaving device comprising a casing having substantially square front and rear walls and having a thickness less than either of the dimensions of the front and rear walls, the dimensions of said device being such as to permit the same to be substantially confined within the hand of the operator, a shaving unit mounted on the front wall of the casing and extending forwardly therefrom and within the projection of said wall, the cutting plane of said shaving unit being substantially parallel to the front wall of the casing.



2,100,136
VEHICLE WHEEL MOUNTING FOR INDEPENDENT SHIFTING
Harry R. Fowler, Toledo, Ohio
Application April 23, 1934, Serial No. 721,984
9 Claims. (Cl. 267—19)

1. A vehicle chassis, a wheel, an axle section for the wheel, spring means between the chassis and section for yieldably spacing the wheel from the chassis, and a directing controller connected between the section and chassis comprising a link fixedly pivotally connected to the axle sec-

tion and extending therefrom, and a pair of relatively movable spaced members having connection to the chassis, each providing a bearing shiftable relatively to the chassis and having spaced connection to the link.

2,100,137
CORN COMBINE
Roy Groves, Sylvia, Kans.
Application March 7, 1934, Serial No. 714,471
8 Claims. (Cl. 130—5)

1. In a corn combine, a conveyer for receiving gathered ears of corn, a husking and shelling chamber, a husking and shelling roll mounted in said chamber adjacent said conveyer to engage the ears of corn thereon, said chamber being provided at a point laterally of the roll with an opening above the roll and being further provided at the top of the chamber with a second opening located at the side of the roll opposite said first mentioned opening, and a suction fan mounted to draw air through said openings and through said chamber transversely across the roll thereabove for evacuating husks from said chamber.

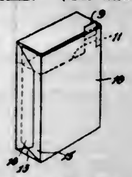
2,100,138
BRISTLE FOR CLEANING DEVICES
Friedrich Heldt, Gelsenkirchen, Germany
Application July 27, 1935, Serial No. 33,615
In Germany November 24, 1933
2 Claims. (Cl. 15—179)

1. A bristle for brushes, brooms and like cleaning devices comprising a core of tempered steel wire rope enclosed in a surrounding cable of tempered steel wires, and a sheathing of a tough, elastic, waterproof and resilient substance bonded to said core.

2,100,139
APPARATUS FOR GIVING DRAFTS TO COTTON SLIVERS
Kikutaro Honda, Osaka, Japan
Application October 30, 1935, Serial No. 47,493
In Japan January 12, 1935
2 Claims. (Cl. 19—131)

1. An apparatus for giving draft to a cotton sliver for spinning yarns comprising a cradle

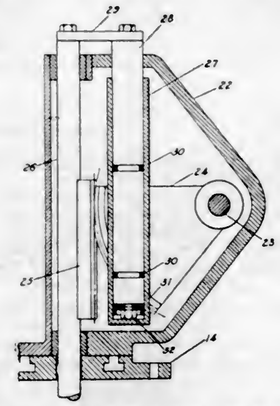
divided into upper and lower pieces and provided with an interlocking means of the pieces, an independent top roller yieldingly held in the upper piece, a spring provided in the upper piece in order to press the top roller downwards, a means provided on the lower piece of the cradle so as to



detachably fix the piece to the frame of the machine, and a lower tenser inserted in a recess provided on each side of the upper edge of the lower piece of the cradle, firmly held in its position by the lower edge of the upper piece of the cradle when the upper piece is interlocked with the lower one.

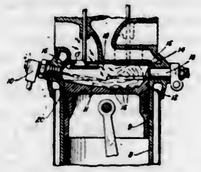
2,100,140
DECALCOMANIA
Ferdinand W. Humphner, Oak Park, Ill., assignor, by mesne assignments, to Mid-States Gummed Paper Co., a corporation of Delaware
Application January 15, 1936, Serial No. 59,318
2 Claims. (Cl. 41—33)

1. A decalcomania comprising: a paper base, a water-soluble adhesive thereon, said adhesive containing glycerine and vegetable wax, a transfer body on said adhesive, and a steel engraving print on the top of said transfer body.



2,100,141
WRAPPING OF BLOCK SHAPED ARTICLES
Thomas Grayland Jackson, London, England, assignor to Molins Machine Company, Limited, London, England
Application August 31, 1936, Serial No. 98,763
In Great Britain October 18, 1935
5 Claims. (Cl. 229—51)

1. A wrapping comprising a substantially rectangular wrapper, said wrapper being folded so as to enclose two pairs of opposed faces of an article with a pair of opposite end portions of the wrapper overlapping, that end portion which is below the other being provided with a tongue, said tongue being folded so as to protrude from between the overlapping end portions to provide a fingerhold to facilitate the removal of the wrapping from about the article contained therein.

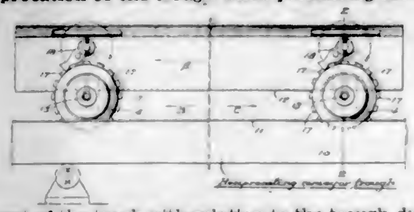


2,100,142
WEIGH CAN AND VALVE MECHANISM
Harry D. Lathrop, Chicago, Ill., assignor to The Lathrop-Paulson Co., a corporation of Illinois
Application February 1, 1935, Serial No. 4,569
7 Claims. (Cl. 137—21)

1. In mechanism of the character set forth, a receptacle, an outlet opening in the bottom thereof, a valve over said opening and adapted to close the same, said valve having a valve stem, means for raising said valve, and means controlled by the flow of liquid through said opening for auto-

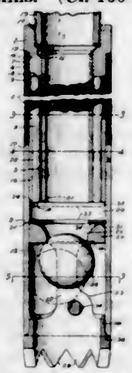
matically engaging said stem to lock said valve in raised position and for automatically disengaging said stem to unlock said valve as soon as the flow ceases.

2,100,143
INTERNAL COMBUSTION ENGINE
Frank C. Mock, Montclair, N. J., assignor to Eclipse Aviation Corporation, East Orange, N. J., a corporation of New Jersey
Application October 20, 1933, Serial No. 694,483
19 Claims. (Cl. 123—32)



1. In an internal combustion engine having a cylinder, a reciprocating engine element in said cylinder, said element having an undulating corrugated surface having a series of round corner grooves having prominent edges at the boundary of the grooves and heated to a relatively high temperature by the combustion of fuel in said cylinder, means in the side wall of the cylinder for injecting fuel into said cylinder against the corrugated surface of said element at an oblique angle thereto, and means in the cylinder opposite to the injection means for igniting said fuel.

2,100,144
CONVEYER-PROPELLED SUPPLY TRUCK FOR USE WITH SHAKING CONVEYERS
Roscoe Moore, Kingston, Pa.
Application April 4, 1936, Serial No. 72,787
14 Claims. (Cl. 198—220)



1. The combination with a reciprocating trough conveyer, reciprocation of which causes movement of a conveyed material in one direction along the trough, of a truck having guided rolling engagement with the trough, and means preventing movement of the truck with relation to

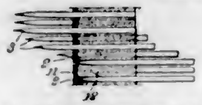
the trough during one phase of each cycle of reciprocation of the trough while permitting move-

ment of the truck with relation to the trough during the other phase of each cycle.

2,100,145
WELL POINT
Thomas F. Moore, Morris Plains, N. J.
Application August 6, 1936, Serial No. 94,675
10 Claims. (Cl. 166—5)

1. In a well point, a jetting and suction conduit, a foraminous filter surrounding said conduit in radially spaced relation thereto and forming an intervening filtrate chamber normally communicating with the lower end of said conduit, valve means actuatable by the influx of jetting fluid whereby to prevent the jetting fluid from entering the filtrate chamber and escaping outwardly through the foraminous filter, a tubular shell surrounding the lower extremity of the jetting and suction conduit and extended downwardly beyond the lower end thereof whereby to constitute a lower head for the well point, a valve seat disposed in said lower head and spaced below the lower extremity of the jetting and suction conduit, a float valve coacting with said valve seat and being free to move axially and laterally within the head aforesaid, responsive to the influx of jetting fluid, and means for limiting the axial movement of said float valve and also for displacing said float valve laterally towards one side of the head pursuant to the passage of jetting fluid through the well point, whereby to provide a substantially unobstructed space for the passage of the jetting fluid past the float valve and through the head.

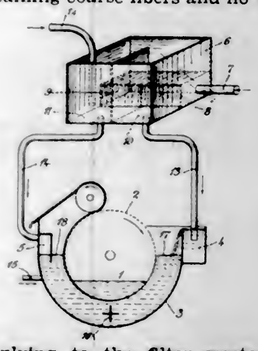
2,100,146
MANUFACTURE OF SOAP FROM MARINE OILS
Sigval Schmidt-Nielsen, Trondhjem, and Arne Flood, Larvik, Norway
No Drawing. Application November 2, 1936, Serial No. 108,900. In Norway June 20, 1933
4 Claims. (Cl. 87—16)



1. Process for the manufacture of soaps from unoxidized and unhydrogenated marine oils comprising the step of heating the marine oils without added catalysts and in the absence of oxygen to a temperature between about 250° C. and 300° C. in closed vessels, the said heating being continued for a period of time not less than 48 hours so as to bring about a substantial decrease of the iodine number by intramolecular saturation of the glyceride molecules and subjecting the resulting product to saponification by the aid of added alkali.

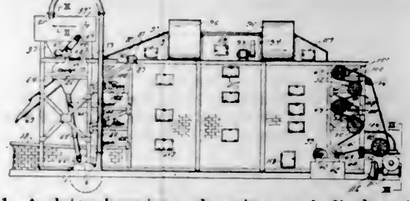
2,100,147
STEERING WHEEL
Hans Oehmen, Berlin-Schmargendorf, Germany
Application November 27, 1933, Serial No. 699,965
In Germany November 28, 1932
1 Claim. (Cl. 74—552)

A steering wheel for motor vehicles including a metallic rim of considerable transverse section and a wrapping consisting of a plurality of identically shaped parts having passages corresponding to said section through which said rim passes, said parts being composed of compressed artificial resin, each of said parts being a fractional part of a quadrant the end of said parts adapted to fit into each other on circumferences of different radii and a separable and adjustable locking means connecting the overlapping ends of said metallic core, said locking means consisting of a bolt with a screw adapted to cooperate with a thread in one of said overlapping ends and with a conical screw-head adapted to engage with a conical bore in the other of said overlapping ends.



2,100,148
APPARATUS FOR PRODUCING IMAGES
Claire Parker, Paris, France
Application October 8, 1934, Serial No. 747,470
In Belgium July 12, 1934
7 Claims. (Cl. 40—28)

1. A device for the production of images which comprises, in combination, a screen provided with a plurality of openings distributed over its surface, said openings extending transversely to said surface and being spaced from each other to leave substantial screen surfaces therebetween, means for projecting onto said screen oblique light rays, and a plurality of elongated elements slidable in said openings so as to project more or less from said surface and to produce shadows on said surfaces between said openings, said shadows being of variable size and shape according to the respective position of said elements with respect to said surface.



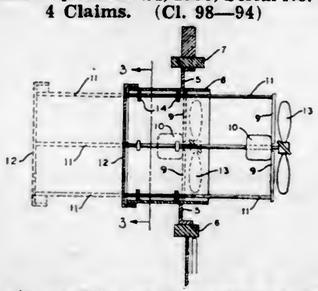
2,100,149
METHOD AND ARRANGEMENT FOR FILTERING WASTE WATER (BACK WATER) FROM PAPER, CELLULOSE, AND WOOD PULP FACTORIES, ETC.
Olaf Qviller, Oslo, Norway, assignor to A/S Thunes Mekaniske Værksted, Skörjen by Oslo, Norway
Application February 24, 1936, Serial No. 63,946
In Norway December 18, 1934
5 Claims. (Cl. 210—201)

1. Method of collecting fibers and finer particles from waste water by filtering through a cloth filter, said waste water being obtained from paper factories, cellulose factories, pulp factories etc., said method consisting in causing the formation of a filtering layer of coarse fibers on the cloth filter by supplying to said cloth filter a pulp containing coarse fibers and no waste water,

then supplying to the filter waste water admixed with coarse fibers, in order to filter the waste water through the said first layer of coarse fibers and thereby causing the said layer to collect additional fibers consisting of an even mixture of the fine fibers from the waste water and added coarse fibers, and then removing the resulting layer from the cloth.

2,100,150
DEHYDRATOR
Oliver W. Randolph, Toledo, Ohio
Application January 20, 1936, Serial No. 59,925
3 Claims. (Cl. 34—12)

1. A drier housing, charging and discharging openings in the housing, means for charging material through the charging opening, said means including an oscillating chute, spreading means including a continuous rake, superimposed conveyors for conveying the material from the charging opening to the discharging opening, agitators between the conveyors, drive means causing the rake and agitators each to be movable relatively to the housing and conveyors, sealing means providing a partition dividing the housing into a charging and spreading compartment, a drying compartment, and separate air supply means for each compartment independent of air re-circulation therebetween, said chute and rake being operable in said air-supplied spreading compartment.



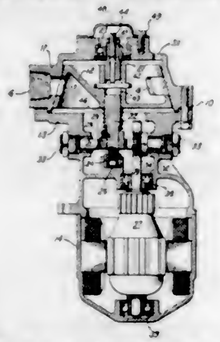
2,100,151
APPARATUS FOR PRODUCING ICE
Hans Tietz, Leverkusen-Wiesdorf, Germany, assignor to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
Application December 14, 1934, Serial No. 757,544
In Germany December 16, 1933
10 Claims. (Cl. 62—107)

2. In an apparatus for producing ice by partial evaporation of water in an evacuated chamber, the arrangement of a moving device upon the surface of which the water is exposed to the

vacuum until it is frozen and a device for withdrawing the ice formed from the vacuum chamber while sustaining the vacuum.

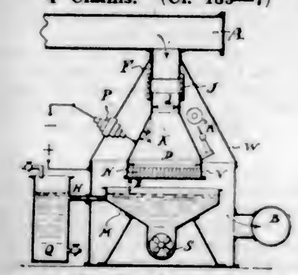
2,100,152
COMBINED CIRCULATING AND VENTILATING FAN ASSEMBLY
Malcolm P. Youker, Bartlesville, Okla.
Application September 24, 1936, Serial No. 102,336
4 Claims. (Cl. 98—94)

1. An air conditioning fan assembly comprising a conduit adapted to be inserted in a suitable opening in the wall of a room, placing the interior of said room in communication with the outside atmosphere, a motor-driven fan supported co-axially by said conduit and slidable longitudinally to a position within one end of the conduit, whereby when in operation said fan will draw fresh air into said room, said fan being slidable in the opposite direction out of the conduit to a position within the room, whereby it may serve as a circulating fan, and means for closing said conduit when the fan is in the latter position.



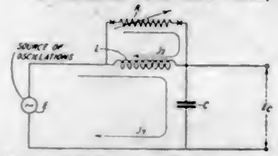
2,100,153
IRON SLEEPER
Carl Wallmann, Julius Grossweischede, and Bernhard Kruse, Mulheim Ruhr, Germany, assignors to firm Vereinigte Stahlwerke Aktiengesellschaft, Dusseldorf, Germany
Original application January 28, 1932, Serial No. 589,466, now Patent No. 2,023,827. Divided and this application December 17, 1934, Serial No. 757,940. In Germany February 10, 1931
1 Claim. (Cl. 238—59)

A double width sleeper more particularly for joint connections of railroad track rails consisting of a body having a recess in the medial portion thereof dividing said body into two trough-shaped portions, each of said portions corresponding in width to the width of a normal sleeper, said recess being interrupted at the rail contact points of the sleeper to provide a contact



surface for the rails which extend across the entire width of the double sleeper, the portions of said sleeper at the rail contact surfaces having a greater thickness than the tops of the trough-shaped portions, and rail locating projections on said rail contact surfaces.

2,100,154
DISTRIBUTOR VALVE
Benjamin N. Ashton, Bloomfield, N. J., assignor to Eclipse Aviation Corporation, East Orange, N. J., a corporation of New Jersey
Application November 30, 1934, Serial No. 755,503
5 Claims. (Cl. 251—107)



1. In a distributor the combination of a housing having inlet and outlet ports and a series of openings, a shaft rotatably mounted in the housing and having a shoulder coacting with the housing for restraining the shaft against axial movement, resilient means urging the shoulder against the housing, a rotor seated in said housing for periodically connecting the openings with the inlet and outlet ports, said rotor being driven by said shaft and slidably mounted thereon, said shaft extending through said rotor and being supported on opposite sides thereof, an adjustable stop threaded in the shaft for positively limiting movement of the rotor on the shaft and maintaining a constant clearance between the rotor and housing in all angular positions of the shaft, and a spring coacting between the shaft and the rotor for urging the rotor against the stop.

2,100,155
ELECTRICAL PURIFICATION OF GASES
Vojtěch Beran, Pribram, Czechoslovakia
Application December 19, 1935, Serial No. 55,281
In Czechoslovakia December 22, 1934
4 Claims. (Cl. 183—7)

1. Apparatus for the electrical removal of dust from gases, comprising electrodes arranged in horizontal parallel planes, the upper electrode being a glow discharge electrode, and the lower electrode being a liquid surface, and means for raising and lowering the surface level of the liquid relatively to the under surface of the glow discharge electrode.

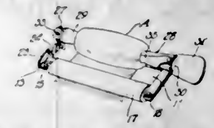
2,100,156
PHASE MODULATION
Werner Buschbeck, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany
Application January 21, 1936, Serial No. 60,141
In Germany February 19, 1935
3 Claims. (Cl. 179—171)

1. In a circuit for producing phase modulation of alternating voltages, a source of alternating voltages of constant frequency and amplitude, an alternating current circuit including a capacity and an inductance in series, and a resistance in parallel with said inductance, means for varying said resistance at the rhythm and rate of modulation potentials, the inductance and capacity of the said alternating current circuit being so chosen that they will approximately obey the formula

$$\omega^2 = \frac{2}{LC}$$

where ω is the angular velocity of the supplied alternating voltage, and means for applying voltages from said source to said circuit.

2,100,157
SWAB
Harry H. Chandler, New Ipswich, N. H.
Application July 9, 1937, Serial No. 152,717
3 Claims. (Cl. 128—269)

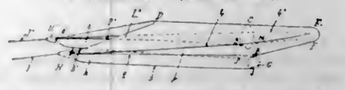


2. In a device of the character described, a receptacle for liquid, a plug having an opening in the upper end of said receptacle, a tube slidably mounted in said plug opening, said tube having an aperture near its bottom to be selectively opened and closed by said plug, and a pliable conductor in said tube terminating adjacent said aperture and extending beyond said tube.

2,100,158
HAIR WAVING APPARATUS
Platon Constantine, New York, N. Y.
Application March 31, 1936, Serial No. 71,832
4 Claims. (Cl. 132—33)

1. A hair clamping device for use in association with a hair curling rod including a relatively flat elongated base of heat resisting material, a

metal plate embedded in one end of said base and projecting therebeyond, an upstanding flange at the outer edge of said plate in spaced relation to the adjacent end of said base, and a curling rod anchor pin pivotally mounted between said

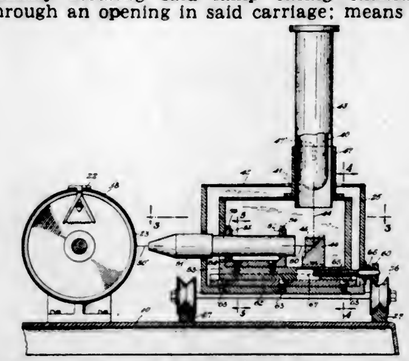


flange and adjacent end of said base for lateral swinging movement to an operative upstanding position to releasably receive one end of a curling rod, or to a collapsed out of the way position against said plate.

2,100,159
POROUS BUSHING FOR BEARINGS AND METHOD FOR MAKING SAME
Victor Curstädt, Berlin, Germany, assignor of one-fourth to Georg H. Hirsch, New York
Application May 21, 1936, Serial No. 80,962
In Germany November 23, 1934
6 Claims. (Cl. 29—149.5)

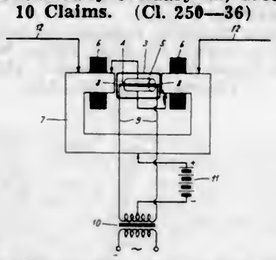
5. A method of making a self-lubricating bushing which consists in spooling a wire crosswise on a mandrel until a hollow cylinder of sufficient wall thickness is formed, subjecting said cylinder to heat and pressure to bond the wire at its crossings and to bring the cylinder into the desired shape of the bushing without destroying the interstices of the wire spool and the regularity of the wire crossings, and filling the interstices with a lubricant.

2,100,160
FISHING NET
Oscar Dahl and William Forsyth Black, La Rochelle, France, assignors to V. D. Limited, London, England
Application June 15, 1936, Serial No. 85,316
In France June 26, 1935
6 Claims. (Cl. 43—9)



1. An upwardly swelling net comprising a covering sheet, a head rope along the front edge of said covering sheet, a rear pocket connected to said covering sheet and having its front edge at a considerable distance to the rear of said head rope, the top sheet of said rear pocket being positioned to operate substantially at the level of the apex of said head rope, and means below said rear pocket for keeping the whole bottom sheet of said rear pocket above the sea bottom and for preventing the escape of the fish under the mouth of said rear pocket.

2,100,161
TELEPICTURE TRANSLATING MECHANISM
William G. H. Finch, New York, N. Y.
Original application February 26, 1936, Serial No. 65,869, now Patent No. 2,047,863, dated July 14, 1937. Divided and this application June 1, 1936, Serial No. 82,713
5 Claims. (Cl. 178—7.4)



1. In a telepicture receiver having a movable

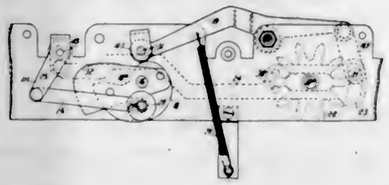
carriage and a signal lamp for generating a light beam in accordance with received electrical signals, a tubular casing for holding said lamp in an inverted position; an optical box within said carriage, a sleeve extending from said box for slidably securing said lamp casing extending through an opening in said carriage; means for

deflecting said light beam mounted within said optical box; a lens system for focusing said deflected beam, adjustably mounted in said box and projecting through openings in said box and said carriage; and means for adjusting the position of the optical box and signal lamp with respect to said carriage.

2,100,162
MAGNETRON DISCHARGE TUBE APPARATUS
Karl Fritz, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany
Application January 25, 1936, Serial No. 60,785
In Germany January 22, 1935
10 Claims. (Cl. 250—36)

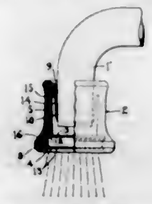
1. An oscillation generator of the magnetron type comprising a magnetron discharge tube, an energy source for producing an electron discharge across the electrodes of said tube, means for producing a magnetic field in the discharge zone and a resonant circuit tunable to the oscillation frequency of said generator, said resonant circuit including the magnetic core of said field-producing means.

2,100,163
GIRDLE
Martin Goodman, New York, N. Y., assignor to The Neatform Co. Inc., New York, N. Y., a corporation of New York
Application May 8, 1936, Serial No. 78,530
17 Claims. (Cl. 2—37)



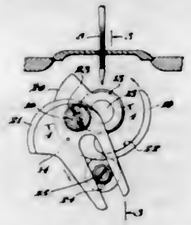
1. A garment comprising a knit yieldable foundation garment, a panel attached to the

garment at a point to be stayed, said panel being so secured to the garment that it is loose when the garment is in unstretched condition, thereby affording free yielding of the elastic material when the garment is stretched, until the slack in the panel is taken up, stays or bones stitched in



place in said panel or support, garters depending from the lower edge of the garment, and elastic tapes extending from the lower corners of the panel or support to the bottom edge of the garment, the lower ends of said elastic tapes being connected to the garment substantially at the points of connection of the garters.

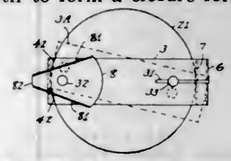
2,100,164
REGISTERING AND DISPLAYING APPARATUS PARTICULARLY APPLICABLE TO TOTALIZATORS
John Handley, London, England
Application August 29, 1936, Serial No. 98,520
In Great Britain January 3, 1935
2 Claims. (Cl. 235—134)



1. A mechanism for transferring stepwise impulses from a register disc of lower order to one of higher order, which comprises a cam rotated by said register disc of lower order, a toothed wheel capable of rotating said register disc of a higher order, a spring-pressed lever actuated by said cam and linked to a pin engageable with the toothed wheel, a reciprocating guide link, said pin being also under the control of said reciprocating guide link, means for actuating said reciprocating guide link concurrently with the cam, the conjoint effect of the spring-pressed lever and the reciprocating guide link being such as to impart a stepwise rotation to said toothed wheel to rotate the register disc of higher order when the register disc of lower order has been rotated a predetermined amount.

2,100,165
FAUCET SPRAY AND STRAINER NOZZLE
August W. Holmberg, Brooklyn, and Centre W. Holmberg, New Rochelle, N. Y.
Application May 5, 1936, Serial No. 77,958
7 Claims. (Cl. 299—141)

2. In a device of the character described, a nozzle body having a gripping surface at the inlet end for engagement with a faucet or the like, a shoulder formed at the outlet end of the bore of said body, and a bead at the outlet end attached to the body part by a relatively thin elastic wall at the outer periphery of the body, said bead and shoulder forming a retaining groove for a strainer, and said thin wall permitting rolling of the bead back over the body part to permit insertion or removal of the strainer.

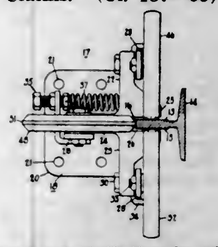


2,100,166
SEWING MACHINE
Richard William Johnson, Charles Lester Loverch, and Max Zaum, Brooklyn, N. Y., assignors to Fine Art Novelty Corporation, New York, N. Y., a corporation of New York
Application March 1, 1937, Serial No. 128,360
4 Claims. (Cl. 112—79)

1. In a sewing machine, the combination with a reciprocating needle and a loop-taker actuating shaft, of yarn shearing mechanism rotatable by said shaft, said mechanism comprising a loop-taker having a shearing surface and a fork-shaped knife eccentrically mounted on and movable with said loop-taker, relatively stationary means between the tines of said forked-knife for guiding the movement of said knife, said knife and said shearing surface of said loop-taker cooperating to cut yarn carried by said needle at a predetermined position of said loop-taker.

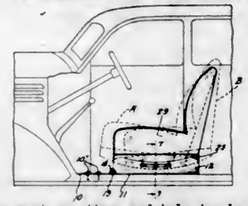
2,100,167
DETACHABLE CLOSURE AND SPOUT FOR CONTAINERS
Robert H. Lehew, Highland Park, Mich.
Application April 8, 1936, Serial No. 73,245
3 Claims. (Cl. 221—23)

1. The combination, with a container having in its cover a pair of diametrically opposed openings, of a flat resilient strip of metal adapted to engage the periphery of said container, said strip having a pair of openings adapted to coincide with said first-mentioned openings and being of sufficient width to form a closure for said first-



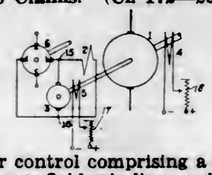
mentioned openings when said strip is rotated about the axis of said container.

2,100,168
BARREL OR DRUM FLANGE UNIT
Earle Gordon Melrath, Philadelphia, Pa., assignor to Melrath Supply & Gasket Co., Inc., Philadelphia, Pa., a corporation of Pennsylvania
Application March 12, 1936, Serial No. 68,366
4 Claims. (Cl. 285—49)



2. In a device of the kind described, a wall having a bung hole therein defined by an inwardly projecting annular lip, a sput including a body and neck, a grooved ring forced onto said neck and against the underside of the body, said sput neck projecting into the bung hole, a gasket positioned between the upper portions of the lip and neck and seated in the groove and means for securing said sput in said bung hole.

2,100,169
ELEVATOR ROLLER GUIDE SHOE
Clifford Norton, South Orange, N. J., assignor to Otis Elevator Company, New York, N. Y., a corporation of New Jersey
Application September 10, 1935, Serial No. 39,906
2 Claims. (Cl. 187—95)

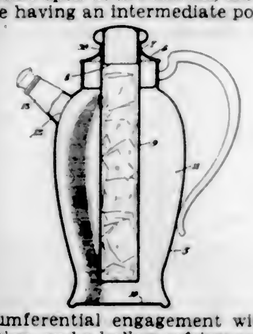


1. In an elevator installation in which a guide rail having a flat guide surface on its face and on each of its two sides is provided for a body movable in the elevator hatchway and in which a plurality of guide rollers, one roller for each of said guiding surfaces, is carried by said body, each roller being yieldably maintained in continuous rolling engagement with the guide rail to guide said body in its movement in the hatchway, the construction of said rollers wherein each of them comprises a wheel having a metal rim and a rubber tire vulcanized to said rim, the tires of the rollers for the side guiding surfaces of said rail each having a curved tread and the tire of the roller for the face guiding surface of said rail having a flat tread of a width less than the width of said face guiding surface, and the rubber of each tire being of a composition and hardness such that the tire resumes its normal shape after being subjected to pressure at the same point over an extended period of time.

2,100,170
ADJUSTABLE SEAT
Walter A. Parks, Milwaukee, Wis.
Application October 4, 1935, Serial No. 43,549
3 Claims. (Cl. 155—14)

1. In an automotive vehicle including a steering wheel at a driver's position, a seat construction at said position comprising a seat and back rest rigidly joined and bodily movable together as a seat unit, a base unit on which said seat unit is shiftably carried, and means connecting said seat unit to said base unit for limited adjustable arcuate movement of said seat unit about a center in the vicinity of said steering wheel, including an arcuate track extending longitudinally of the vehicle and connected to one of said units and an element on said track connected to the other unit, said track and element being relatively movable so that said seat unit may be bodily shifted on said base unit to adjust it to different positions with respect to said wheel.

2,100,171
ELECTRICAL MACHINE INSERTED IN A SERIES NETWORK AND OPERATING AT AN ADJUSTABLE CONSTANT SPEED
Joseph Maximus Pestarini, Grant City, Staten Island, N. Y.
Application October 14, 1935, Serial No. 44,990
In France January 22, 1934
6 Claims. (Cl. 172—239)

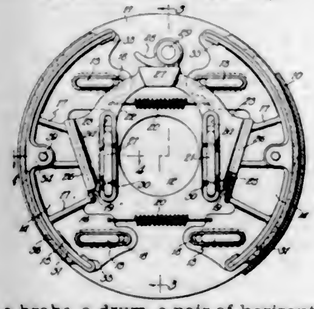


1. A motor control comprising a direct current motor having a field winding and an armature supplied with constant current and adapted to operate at a practically constant speed showing slight discrepancies from the no load speed even when the torque varies from full accelerating torque to full braking torque, a first auxiliary source of E. M. F. varying with the speed of the motor and connected to the said field winding to form a closed circuit, a second auxiliary source of constant current connected to the said closed circuit at two points for supplying to the field winding of the motor a current automatically varying with the variation of the E. M. F. of the first auxiliary source and means for controlling the E. M. F. developed by the first auxiliary source and so controlling the no load speed value of the motor.

2,100,172
COCKTAIL SHAKER
Jean M. Riegel, New York, N. Y.
Application February 12, 1936, Serial No. 63,488
2 Claims. (Cl. 220—1)

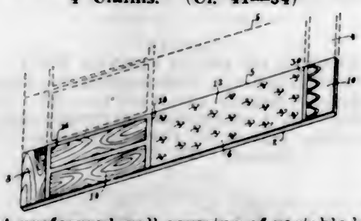
1. A cocktail shaker or the like comprising a main vessel, a closure cap therefor having an an-

nular recessed portion in the lateral wall thereof and a downwardly extending tube therein sealed at the top and open at the bottom, the lateral wall of the tube having an intermediate portion there-



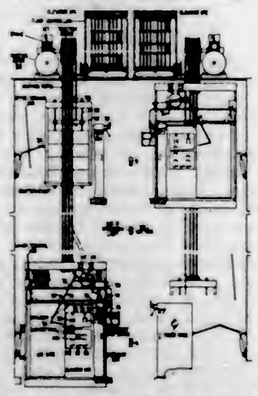
of in circumferential engagement with said recessed portion, and a hollow refrigerant container with an open-ended top portion in detachable engagement with said tube.

2,100,173
CLOSURE DEVICE
Harry Ernest Rubens, New York, N. Y.
Application February 23, 1935, Serial No. 7,730
1 Claim. (Cl. 132—80)



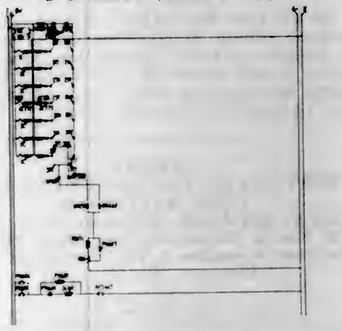
In a collapsible tube for containing a paste-like composition having a neck; a closure cap thereon and having a closed head and a cylindrical wall section extending therefrom; a dispensable article partially contained within said cylindrical wall section and extending beyond for dispensing purposes, whereby when said article is being dispensed, the tube may serve as a handle for supporting the same.

2,100,174
BRAKE
Peter Ruffino, Brooklyn, N. Y.
Application March 22, 1935, Serial No. 12,345
6 Claims. (Cl. 188—78)



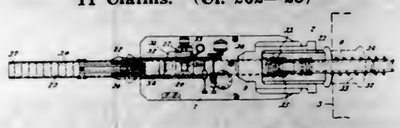
1. In a brake, a drum, a pair of horizontally opposed shoes slidably mounted relative to said drum, a vertically slidable yoke shaped wedge member intermediate said shoes, coacting wedge surfaces between the ends of said member and the inner mid portions of the respective shoes, spring means acting upon said shoes to move the same toward each other to retracted position, and actuating means engageable with the top of said yoke shaped member for sliding said member to cause the coacting wedge surfaces to expand said shoes against the tension of said spring means into braking engagement with said drum.

2,100,175
WALL COVERING
John Tomec, Trenton, N. J.
Application June 1, 1935, Serial No. 24,472
4 Claims. (Cl. 41—34)



1. A preformed wall covering of variable length adapted to be applied to the walls of rooms of different height comprising a unit of greater length than width embodying a base member and having water resistant decorative material applied to adjacent areas of said base member in individually complete designs arranged in a predetermined relation lengthwise of the unit with the edges of the designs extending transversely of said unit, the decorative material applied to each of said areas simulating a conventional type of wall covering and the designs on adjacent areas simulating wall coverings of different types, said unit being severable along the edges of said areas to remove a part or all of an area without impairing the design on the remainder of said areas whereby wall covering shorter in length than said unit but containing each of said designs may be produced from said unit.

2,100,176
ELEVATOR CONTROL SYSTEM
Harold Waters, Hohokus, and Arthur Willard Paulson, Tenafly, N. J., and Mathew Troster, Jr., New York, N. Y., assignors to Otis Elevator Company, New York, N. Y., a corporation of New Jersey
Application January 31, 1936, Serial No. 61,762
79 Claims. (Cl. 187—29)

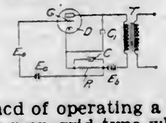


1. An elevator system comprising; a plurality of elevator cars; a plurality of landings served by the cars; call registering means for each of said landings; means for causing one of said cars to respond to the calls that are registered, so long as it is the only car in operation; and means for causing a second car to start in operation in response to a subsequently registered call to assist said one car in answering calls, provided such subsequent call is behind said one car.

2,100,177
ELEVATOR SYSTEM
Harold Waters, Hohokus, and Arthur Willard Paulson, Tenafly, N. J., and Mathew Troster, Jr., New York, N. Y., assignors to Otis Elevator Company, New York, N. Y., a corporation of New Jersey
Original application January 31, 1936, Serial No. 61,762. Divided and this application October 30, 1936, Serial No. 108,380
4 Claims. (Cl. 187—29)

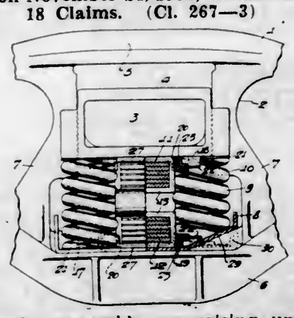
1. In combination; an elevator car movable in a hatchway to serve a plurality of landings; a plurality of circuit controlling means, one for each of said landings; means common to said circuit controlling means and adapted upon movement with respect thereto to cooperate therewith individually in succession; means for causing movement of said common means with respect to said circuit controlling means in accordance with movement of the car; means operable to slow down the car; and means responsive to the movement of said common means out of cooperative relationship with said circuit controlling means for a landing for causing operation of said slow down means to slow down the car at the landing for which such circuit controlling means is provided.

2,100,178
COAL MINING MACHINE
Jerome C. White, Pittsburgh, Pa., assignor to Pittsburgh Coal Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application May 11, 1936, Serial No. 79,022
11 Claims. (Cl. 262—28)



1. A coal mining machine comprising cutting means, a mechanical conveying device for receiving and conveying the cuttings from the cutting means, and means for confining and withdrawing dust originally carried into the conveying device along with the cuttings.

2,100,179
METHOD OF COATING METAL ARTICLES WITH ZINC
Allan Heathcote Williams, Chester, England
No Drawing. Application March 16, 1937, Serial No. 131,183. In Great Britain August 9, 1935
1 Claim. (Cl. 91—20.2)



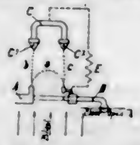
A method of coating metal articles and more particularly window frames with zinc carried out in a bath comprising a thin layer of molten zinc floating on a body of molten lead, which method comprises heating the molten lead to a temperature of about 550° to 570° C., passing the article to be coated completely through the thin layer of molten zinc into the molten lead, leaving the article in the molten lead for a sufficient length of time to heat it to about 490° C., and finally withdrawing the heated article through the thin layer of molten zinc.

2,100,180
ELECTRICAL COMMUNICATION CIRCUIT
Stuart Ballantine, Mountain Lakes, N. J., assignor, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware
Application December 17, 1929, Serial No. 414,797
21 Claims. (Cl. 250—27)

1. The method of operating a vacuum tube detector of the screen grid type which includes the step of adjusting the polarizing potentials to effect linear detection for a limited range of input voltages, amplifying received signals to bring the detector input voltages to a value not less than those falling within said limited range, and extending the range of input voltages for which linear detection obtains by applying to one element of the tube a bias voltage derived from the rectified current in both the screen grid and anode circuits of the detector.

2,100,181
RAILWAY TRUCK
Donald S. Barrows, Rochester, N. Y., assignor to The Symington-Gould Corporation, Rochester, N. Y., a corporation of Maryland
Application November 24, 1934, Serial No. 754,659
18 Claims. (Cl. 267—3)

1. A spring assembly comprising upper and lower plates, helical springs and leaf springs disposed between said plates and arranged to operate in parallel under an applied load, said leaf springs being held together by band means, the



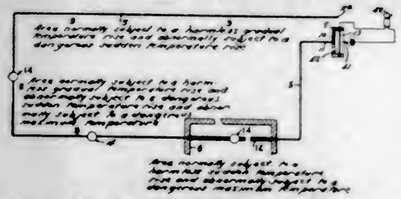
load carrying surfaces of said helical springs contacting the adjacent surfaces of said plates, said plates comprising a relatively thick portion adapted to provide a seat for the leaf springs and receive and position said band means, and a relatively thin portion rigidly connected thereto and provided with means for centering said helical springs.

2,100,182

COMPRESSED FLUID CIRCUIT BREAKER WITH MULTIPLE BREAKS

André Clerc, Villeurbanne, France, assignor to Ateliers de Constructions Electriques de Delle, Paris, France

Application November 16, 1934, Serial No. 753,341
In Germany December 18, 1933
11 Claims. (Cl. 200—148)



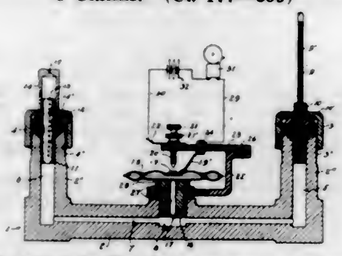
1. A circuit-breaker comprising, in combination, two contacts relatively movable to produce an arc at break; two fixed, electrically interconnected auxiliary electrodes spaced laterally from each other in the plane of movement of said contacts, and having their free ends directed toward the latter; and means to project a blast of extinguishing fluid past said relatively movable contacts toward said fixed auxiliary electrodes and transversely to the path of movement of said contacts, to project the arc extending between said relatively movable contacts into contact with said fixed auxiliary electrodes, thereby to divide said arc into two separate arcs, each extending parallel to the direction of said blast between one of said relatively movable contacts and one of said auxiliary electrodes, said separate arcs being thus readily extinguished by said blast.

2,100,183

METHOD AND APPARATUS FOR INITIATING TEMPERATURE RISE ALARMS

Frank M. Cowan, Plainfield, N. J., assignor to American District Telegraph Company, New York, N. Y., a corporation of New Jersey

Application February 24, 1932, Serial No. 594,875
15 Claims. (Cl. 177—355)



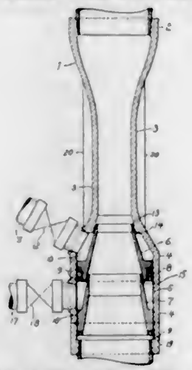
1. In a fire-detector-tube system operative by sudden increase in interior tube-pressure, and inoperative for gradual increase and including a tube for installation adjacent to an area normally subject to harmless sudden temperature rise, and abnormally subject to a dangerous maximum, heat insulation around the tube in said area to prevent response by the system to said sudden rise; and means in said area, operative by said dangerous maximum for suddenly increasing the pressure in the tube when said dangerous maximum is reached.

2,100,184

BREATHER FOR TEMPERATURE RISE ALARM SYSTEMS

Frank M. Cowan, Plainfield, N. J., assignor to American District Telegraph Company, New York, N. Y., a corporation of New Jersey

Application May 24, 1933, Serial No. 672,537
8 Claims. (Cl. 177—355)



1. An air tube fire detector system comprising a detector, tubing, a rigid breather of dense porous mineral material, means for securing the breather to said system so that air may be interchanged between the inside and outside of the tubing through the breather.

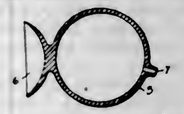
2,100,185

APPARATUS FOR THE MOVEMENT OF VISCOUS MATERIALS

Gunnar C. Engstrand, Matawan, N. J., assignor to Simon Marmorek, New York, N. Y.

Application November 6, 1936, Serial No. 109,465
2 Claims. (Cl. 103—267)

1. A steam jet pump comprising, in combination, a narrow throat piece, an inner annular steam jet nozzle discharging therethrough, a restricted passage through said nozzle, an outer annular steam jet nozzle discharging through the passage of the inner steam jet nozzle, a passage through the outer nozzle, the outer nozzle passage having a substantial larger cross section than the passage of the inner one.



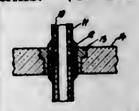
2,100,186

TUB SHOWER

Charles H. Hagopian, New York, N. Y.

Application July 17, 1935, Serial No. 31,762
7 Claims. (Cl. 4—150)

1. In a bath shower, a manifold secured to the faucet of the bath tub, spray tubes secured to said manifold and secured to the inner surface of the bath tub having nozzles adapted to direct jets of water inwardly and downwardly from the upper edge of the bath tub, and suction cups securing said spray tubes to



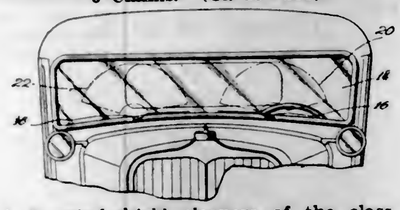
and around the upper inner surface of said bath tub.

2,100,187

ENTRANCE INSULATION FOR ELECTRICAL CONDUCTORS

Hans Handrek, Bad Klosterlausnitz, Germany, assignor to Porzellanfabrik Kahla, Kahla, Germany

Application February 4, 1935, Serial No. 4,858
In Germany December 27, 1933
9 Claims. (Cl. 173—311)



1. The combination comprising an insulating element having an aperture, a carrier of ceramic insulating material passing therethrough, a conductive film on said carrier constituting a conductor for electrical energy passing through said element, and projecting therefrom at both sides thereof to form electrical contact terminals, and a flux filling the space between said carrier and said insulating element.

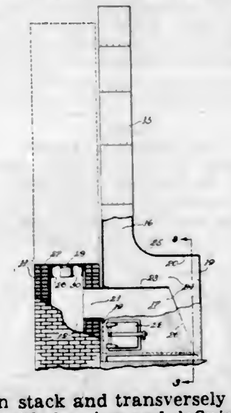
2,100,188

WINDSHIELD CLEANER

Elwood Hansmann, Glencoe, Ill., assignor to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia

Application October 17, 1934, Serial No. 748,628
6 Claims. (Cl. 15—255)

1. In wind-shield cleaners of the class described, the combination of a plurality of wiper blades, common driving means therefor, a separable detachable connection connecting each blade with said driving means, respectively, a handle having parts positioned to be movable thereby into engagement with the parts of said connections secured to the wiper blades respectively, for detaching both of said detachable connections and simultaneously moving said blades to parked position.



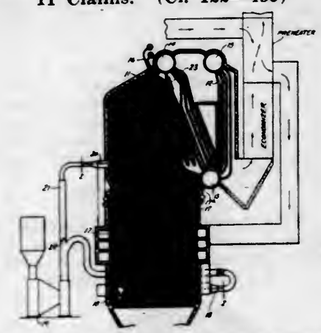
2,100,189

GAS SEPARATOR FOR INCINERATORS

George J. Irsch, Harvey, Ill., assignor of one-half to William B. Stephenson, Chicago, Ill.

Application September 8, 1932, Serial No. 632,151
12 Claims. (Cl. 110—18)

1. In an incinerator, in combination with a vertical main stack, means closing the upper end of said stack, a vertical auxiliary stack communicating laterally with one side of the upper end of said main stack, said auxiliary stack having a base constituting a separating chamber, a flat substantially horizontal baffle wall in said separating chamber extending laterally with respect



to said main stack and transversely from side to side within said chamber and defining a tortuous lateral and upward passage for the flue gases between said stacks, and a screen extending across said passage.

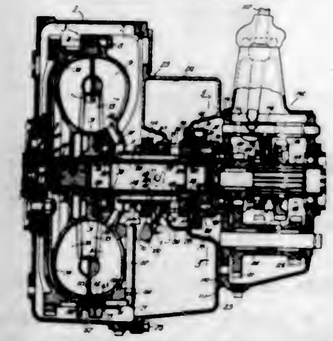
2,100,190

METHOD OF CONTROLLING SUPERHEAT TEMPERATURE

George P. Jackson, Flushing, N. Y., assignor to Combustion Engineering Company, Inc., New York, N. Y.

Application March 2, 1937, Serial No. 128,571
11 Claims. (Cl. 122—459)

1. The method of maintaining substantially constant superheated steam temperature in a boiler provided with a convection type superheater which comprises; burning at least the greater portion of the amount of fuel required to produce a quantity of gases at a temperature adequate to generate and superheat to a predetermined temperature the amount of steam required at a determined boiler load; imparting heat from the burning fuel to generating elements for generating part of the amount of steam required; separately burning any additional fuel required and mingling the hot gases therefrom with the gases that have been partially cooled by the extraction of heat therefrom; passing the mingled gases over other generating and the superheating elements to generate the remainder of the total amount of steam required and to superheat the latter to said predetermined tempera-



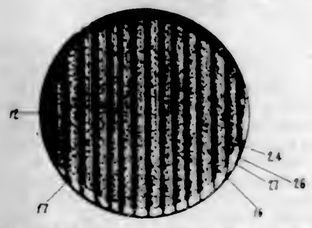
ture; and, as the steam demand falls, decreasing the amount of fuel burned to provide gases from which heat is extracted before passing over said other generating and said superheating elements while substantially proportionately increasing the amount of fuel burned to produce gases passed directly over said other generating and superheating elements for maintaining the gases passing over the latter heated to a temperature adequate to maintain said predetermined superheated steam temperature at low boiler loads.

2,100,191

HYDRAULIC DRIVE

Robert Lapsley, Berrien Springs, Mich., assignor to Clark Equipment Company, Buchanan, Mich., a corporation of Michigan

Application August 2, 1934, Serial No. 738,091
16 Claims. (Cl. 60—54)



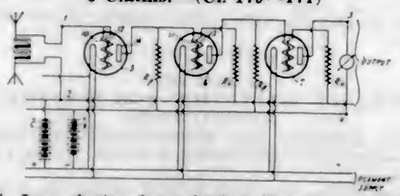
1. In a hydraulic drive, a stationary housing, torque transmitting means including a rotatable casing having driving and driven elements therein, a shaft journaled in said housing and carrying said driven elements, a liquid sump carried by said housing spaced axially of said shaft from said torque transmitting means, a stationary sleeve surrounding said shaft and extending from said sump to the interior of said rotatable casing, and valve means disposed between said sump and the interior of said sleeve for controlling the flow of liquid from said sump through said sleeve into said rotatable casing.

2,100,192

TRAY FOR CANARY CAGES

Joseph P. Leindorf, Pelham Manor, N. Y.

Application November 1, 1935, Serial No. 47,751
3 Claims. (Cl. 119—17)



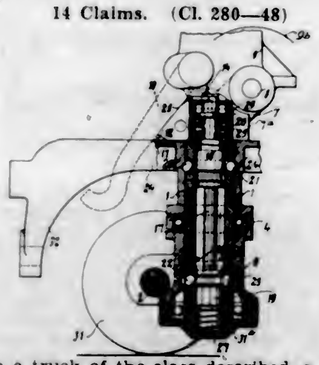
1. In a bird cage, a removable tray for the cage bottom, comprising a dish having a raised border bounding the whole exterior, said dish having a plurality of upstanding projections on its bottom, each of a size to be grasped by a bird's foot, the upper portions of the projections being smooth, and the lower portions of the projections and the spaces between the projections being rough.

2,100,193

LINEAR AMPLIFIER WITH EXTRA WIDE BAND PASS CHARACTERISTICS

Nils E. Lindenblad, Port Jefferson, N. Y., assignor to Radio Corporation of America, a corporation of Delaware

Application November 21, 1934, Serial No. 754,038
6 Claims. (Cl. 179—171)



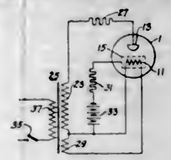
1. In a device for relaying direct current potentials and alternating current potentials, a thermionic tube having an anode, cathode and control grid, and an auxiliary gridlike electrode of substantially the same size as said control grid mounted adjacent said control grid, a circuit connected between the control grid and cathode of said tube, said circuit including a source of potential which maintains said control grid positive relative to said cathode, means for applying the potentials to be amplified to said circuit, an output circuit connected between the anode and cathode of said tube, said output circuit including a source of direct current potential to maintain said anode positive relative to said cathode, and a source of potential connected between said auxiliary grid and the cathode of said tube to maintain said auxiliary grid negative relative to said cathode to compensate the effect of the positive potential on said control grid on the tube operation.

2,100,194

LIFTING-TRUCK

Jakob Loef, Moosburg, Germany

Application June 6, 1931, Serial No. 542,683. Renewed May 25, 1935. In Germany June 10, 1930
14 Claims. (Cl. 280—48)



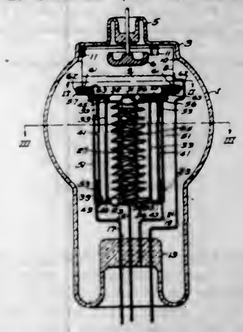
1. In a truck of the class described, a steering head, a king pin in said head, a steering assembly including a pivoted steering lever adapted to impart steering movement to said king pin, said lever being movable from a vertical position to a substantially horizontal position relatively to said steering head, a wheel assembly mounted for rotation on the axis of said king pin and relatively to or in locked relation to said steering assembly, and means actuated by said lever when in an upright position to release said wheel assembly for free rotation relatively to said steering assembly.

2,100,195

ELECTRIC DISCHARGE APPARATUS

Erwin F. Lowry, Forest Hills, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application October 3, 1935, Serial No. 43,347
6 Claims. (Cl. 250—27)



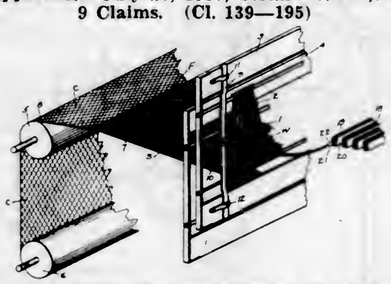
1. In combination an elctrode that is to be heated to emit electrons, means for heating said electrode, an electrode for collecting the electrons emitted by said first-named electrode, a member disposed adjacent to said emissive electrode in the path of the heating energy emitted by said emissive electrode, said member being capable of emitting electrons when it is heated from said first-mentioned electrode, means for impressing a difference of potential between said electron collecting electrode and said emissive electrode, connecting means establishing a normal potential relationship between said member and said emissive electrode whereby when said member is below a predetermined temperature it operates as a blocking electrode to block the passage of current between said emissive electrode and said collecting electrode and when it is heated to a temperature above said predetermined value its blocking effect is suppressed and electrons pass between said emissive electrode and said collecting electrode.

2,100,196

ELECTRON DISCHARGE DEVICE

Erwin F. Lowry, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application January 4, 1936, Serial No. 57,536
15 Claims. (Cl. 250—27.5)



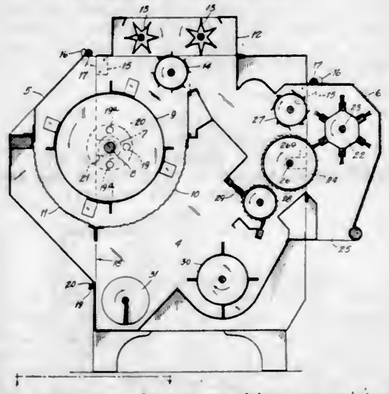
15. In an electron discharge device, a cathode structure including a plurality of concentric shields, a source of electrons within the innermost shield, an electrostatic guard within said shields and surrounding said source, said guard permitting electrons from said source to emerge only into the space between it and the shield, an anode spaced from the cathode structure in the direction of the length of said shields, a grid between said anode and said cathode structure and transverse of said direction, and means for supporting said grid from said shields including an annular body of insulating material contacting both grid and shields.

2,100,197

SELVAGE FORMING DEVICE

George H. McRae, Thomaston, Ga., assignor to Draper Corporation, Hopedale, Mass., a corporation of Maine

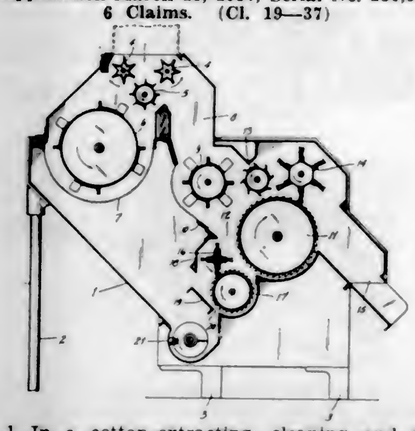
Application July 27, 1937, Serial No. 155,881
9 Claims. (Cl. 139—195)



1. In a loom, the combination of vertically moving harness frames, a selvage wire extending forwardly from said harness frames to a point in the cloth selvage in front of the fell, the forward end of said wire being free, and means connecting the rearward end of said wire to one of said harness frames for vertical movement therewith, said means including a spring constructed and arranged to yield and thereby shift said wire longitudinally of the selvage as the weaving progresses.

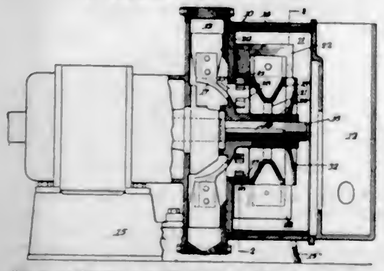
2,100,198

EXTRACTOR-CLEANER MACHINE



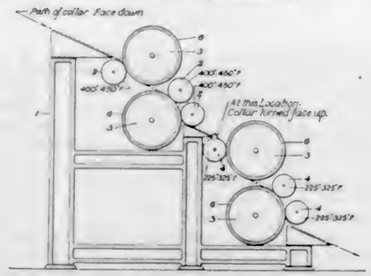
John E. Mitchell, Dallas, Tex.

Application January 8, 1936, Serial No. 58,079
5 Claims. (Cl. 19—37)



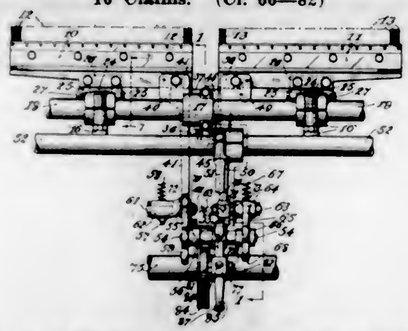
4. An extractor-cleaner machine comprising a central vertical casing section having a preparatory cleaning cylinder and an extractor cylinder mounted therein at its opposite sides and projecting through openings in the front and rear walls of said casing section, front and rear detachable casing sections normally closing said openings and inclosing the projecting portions of said cylinders, a doffing cylinder for said extractor cylinder mounted in and carried by the front casing section, the latter being constructed to receive the cotton removed by the doffer from the extractor cylinder and to discharge same from the machine.

2,100,199
EXTRACTOR-CLEANER RECLAIMING MACHINE
John E. Mitchell, Dallas, Tex.
Application March 13, 1937, Serial No. 130,619
6 Claims. (Cl. 19—37)



1. In a cotton-extracting, cleaning and reclaiming machine, in combination with an extracting cylinder and means for delivering a stream of mixed cotton and hulls to the up-going side thereof, which latter provides one side of an opening for the escape past the cylinder of hulls and trash, and of small-lock cotton not engaged by the teeth of the cylinder, a directing cylinder located beneath said opening and rotating in the opposite direction to the extracting cylinder, a reclaiming cylinder located below and in doffing relation to the directing cylinder and adapted to receive on its up-going side from said directing cylinder the products escaping through said opening and to have reclaimed cotton locks doffed therefrom by the directing cylinder and returned to the rising side of the extracting cylinder, and means for permitting the escape of hulls and trash from the reclaiming cylinder.

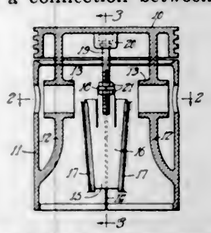
2,100,200
GRINDING MILL
Alfred J. Mosley, Aurora, Ill.
Application August 9, 1933, Serial No. 684,370
3 Claims. (Cl. 83—11)



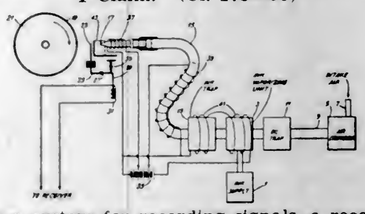
3. In a reducing mill, in combination, a casing inclosing a reducing chamber and a suction fan chamber, the two chambers being separated by a wall having an aperture forming the eye of the fan assembly and an annular series of ports surrounding the eye, a shaft projecting from the outer wall of the fan chamber through the named aperture, a fan and a beater wheel mounted on the shaft, the wheel being tubular and having an imperforate rim making substantial contact with the eye of the fan assembly, a diaphragm facing the opposite end of the wheel chamber and spaced from the wheel rim to provide an annular air admission passage, and a damper for controlling the named ports.

2,100,201
PROCESS FOR MANUFACTURING WEARING APPAREL AND PRODUCT THEREOF
Charles C. Quenelle, Newburgh, N. Y., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
Application October 24, 1935, Serial No. 46,473
7 Claims. (Cl. 154—2)

1. The process of making three-ply, semi-stiff collars which comprises coating an interliner on one side only with a thermoplastic adhesive, providing the same with a face and back ply, and applying sufficient heat and pressure to cause the said adhesive to migrate through the interliner and adhere to the ply on its opposite side.



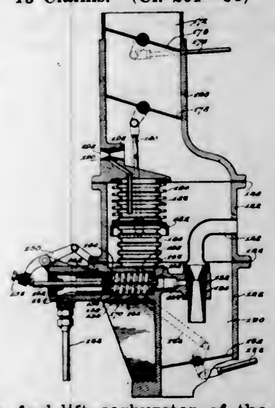
2,100,202
FULL FASHIONED HOSIERY KNITTING MACHINE
Gottfried Scherle, Bloomfield, N. J.
Application August 19, 1936, Serial No. 96,734
10 Claims. (Cl. 66—82)



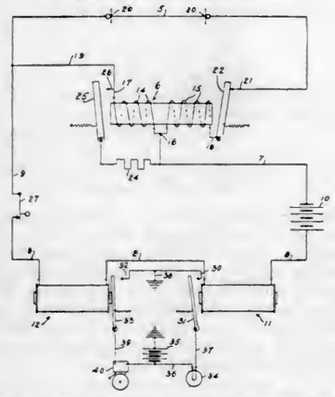
1. In a knitting machine, in combination, a pair of needle bars having adjacent opposed ends, and a series of needle bar arms hingedly connected to said needle bars, one of said arms being hingedly connected to the opposed end portions of both of said needle bars.

2,100,203
PISTON
Walter Leonard Schoengarth, Ironwood, Mich., assignor to Benjamin G. Harmon, Chicago, Ill.
Application August 10, 1935, Serial No. 35,643
5 Claims. (Cl. 309—9)

1. A piston of the character described including a head portion and a circumferentially expandible and contractible skirt portion, slidable means for expanding or contracting said skirt portion and a connection between said slidable means and said head portion having a different coefficient of expansion than the material composing said head and skirt portions.

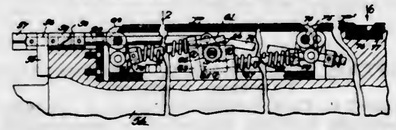


2,100,204
FACSIMILE SYSTEM
Henry Shore, Elizabeth, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application June 3, 1933, Serial No. 674,147
1 Claim. (Cl. 178—96)



In a system for recording signals, a recording fluid supply, means for vaporizing the recording fluid, means for maintaining the vaporized fluid in a heated state, means for continuously projecting constant amounts of the vaporized fluid toward a recording surface, and an electromagnetic shutter for controlling the amount of vaporized fluid reaching the surface upon which recordings are to be made in accordance with the representations desired upon the recording surface.

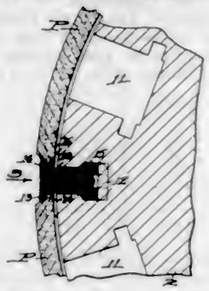
2,100,205
CARBURETOR
Carl W. Spohr, Chicago, Ill.
Application June 24, 1936, Serial No. 86,967
13 Claims. (Cl. 261—34)



13. In a fuel-lift carburetor of the class described, the combination of a nozzle, means connecting said nozzle with a source of fuel supply having a variable head with respect to said nozzle, a mixing chamber into which said nozzle discharges, means for supplying secondary air to said mixing chamber, a valve regulating the supply of secondary air to said mixing chamber, and a control for said valve responsive to variations in head between said nozzle and its source of fuel supply.

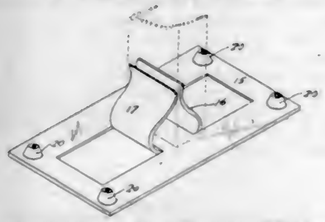
2,100,206
DIFFERENTIALLY OPERATED DETECTION CIRCUIT
John J. Stephens, Brooklyn, N. Y., assignor to American District Telegraph Company, Jersey City, N. J., a corporation of New Jersey
Application August 4, 1934, Serial No. 738,481
7 Claims. (Cl. 177—311)

7. An alarm system comprising a balancing control relay; an energized series circuit including a loop, an indicating circuit portion having signal means associated therewith; said relay having a winding disposed in the loop, there being a normally closed armature switch cooperating with the winding; a second relay winding in shunt to the loop; said loop having therein means for producing impedance responsive to a sound of a predetermined value, whereby when such sound occurs the varied resistance may cause the current to flow through the shunt winding and said portion so as to initiate a signal in the first mentioned means.



2,100,207
PRINTING PLATE CYLINDER
Henry A. Wise Wood, New York, N. Y., assignor to Wood Newspaper Machinery Corporation, New York, N. Y., a corporation of Virginia
Original application May 5, 1931, Serial No. 535,165. Divided and this application June 29, 1932, Serial No. 619,887. Renewed May 4, 1937
6 Claims. (Cl. 101—378)

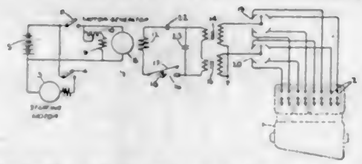
1. The combination with a printing plate cylinder, of oscillatable clamps for the printing plates, a rod carried by the cylinder, a shaft, said rod and shaft having cooperating cam surfaces on their adjacent ends, whereby the turning of



the shaft will move the rod longitudinally, and means connected to said rod for swinging said clamps into and out of clamping position according to the direction in which the rod is moved.

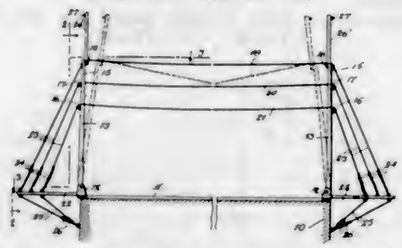
2,100,208
MARGIN BAR FOR PRINTING CYLINDERS
Henry A. Wise Wood, New York, N. Y., assignor to Wood Newspaper Machinery Corporation, New York, N. Y., a corporation of Virginia
Application March 21, 1934, Serial No. 716,560
Renewed May 4, 1937
6 Claims. (Cl. 101—378)

1. The combination with a printing plate cylinder having a longitudinal groove, of a pair of margin bars located in said groove and projecting beyond the surface of the cylinder, each margin bar having a projection for engaging the ledge of a printing plate, said margin bars being movable circumferentially to properly hold down the ledges of two plates on the cylinder located on opposite sides of the two margin bars.



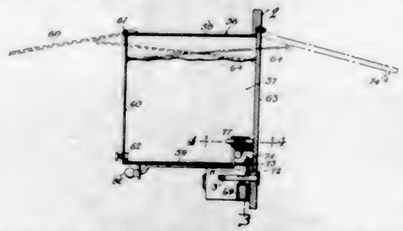
2,100,209
STUDDING SHOE
Alex H. Bieuel, Wauwatosa, Wis.
Application January 20, 1936, Serial No. 59,845
3 Claims. (Cl. 72—115)

2. A studding shoe of the character described comprising, a flat plate adapted to fit flush on a floor surface and be fastened thereto, a pair of resilient tongues formed on said plate and adapted to resiliently retain a metal stud therebetween, and a deformable projection on said plate having means to retain and guide a nail while driving into said floor.



2,100,210
IGNITION SYSTEM FOR INTERNAL COMBUSTION ENGINES
Bernard M. Cain, Ballston Lake, N. Y., assignor to General Electric Company, a corporation of New York
Application December 14, 1934, Serial No. 757,513
5 Claims. (Cl. 123—148)

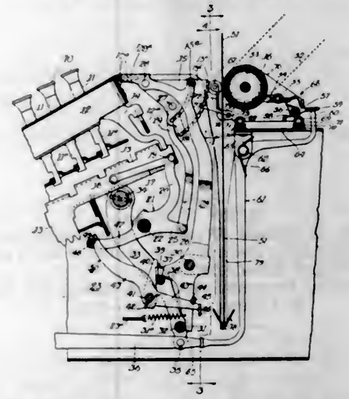
1. A multi-spark ignition system for an internal combustion engine having a spark gap comprising an inductive source of alternating current, a transformer having its primary connected in circuit with said source and its secondary con-



nected with said spark gap and a capacitor connected across said primary, the impedance of said capacitor being substantially no greater than the no load impedance of said transformer.

2,100,211
BOMB PROTECTION APPARATUS
Francisco Feitosa, New York, N. Y.
Application December 16, 1936, Serial No. 116,126
2 Claims. (Cl. 89—36)

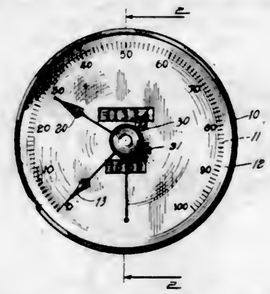
1. A bomb protection apparatus including a base frame, a series of upright frames of varying heights pivotally connected to the base frame, nets connecting the upper ends of pairs of said upright frames, fixed arms extending horizontally from the base frame, stays connecting said arms with the upright frames, coil springs constituting portions of said stays, and cables connecting said arms and said upright frames, said cables limiting the inward pivotal movement of the frames and the sag of the nets.



2,100,212
ELECTRICALLY ACTUATED DISPENSING APPARATUS
Maxime Ferrer, Jamaica, N. Y.
Application November 20, 1936, Serial No. 111,806
1 Claim. (Cl. 232—1)

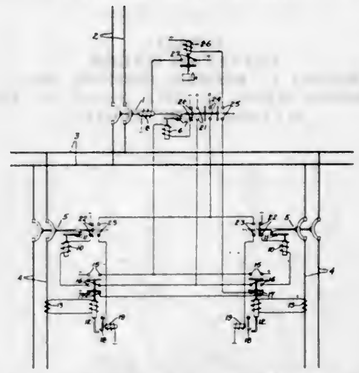
A device of the character described including means forming a compartment, said means being formed with inner and outer doors, a flexible member connecting said doors, said flexible member being of a length to permit one door to be opened without molesting the other door while said other door is capable of being swung sufficiently to pull said flexible means for closing the

first mentioned door, a catch for locking the first mentioned door closed, electrically actuated means for disengaging said catch, and spring actuated means for opening the first mentioned door.



2,100,213
PRINTING MECHANISM
Max Garbell, Chicago, Ill., assignor to Victor Adding Machine Company, Chicago, Ill., a corporation of Delaware
Application December 28, 1935, Serial No. 56,465
8 Claims. (Cl. 101—93)

1. In a machine of the character described, having racks arranged for reciprocating movements, a platen type carriers adapted to selectively impinge the platen, said type carriers being arranged in side-by-side relation and having a series of type thereon, means supporting the type carriers for pivotal movements, means connecting the type carriers with the racks to pivotally move to adjust said type carriers upon the movement of the racks, lock means coacting with said type carrier supporting means rigidly supporting the same, yieldable means urging said supporting means and type carriers toward the platen, and means coacting with said lock means for effecting a release thereof with said supporting means upon a predetermined movement of the rack.

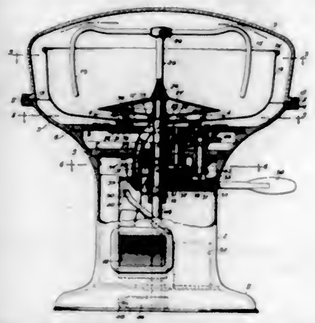


2,100,214
ADJUSTABLE SPEED LIMIT INDICATOR
Elmer J. Graham, Denver, Colo., assignor of one-half to Leslie H. Rees, Denver, Colo.
Application March 28, 1936, Serial No. 71,479
Renewed October 5, 1937
1 Claim. (Cl. 200—56)

In a speed indicating device having a dial and a speedometer hand for indicating positions on said dial, means for closing an electrical circuit when said speedometer hand reaches certain positions on said dial comprising: a setting hand pivotally mounted in axial alignment with said speedometer hand; a spring stud projecting inwardly from said setting hand toward said speedometer hand; a spring arm extending from said stud parallel to said setting hand across the axis thereof; a first contact on the latter extremity of said spring arm; a rear extremity on said speedometer hand positioned diametrically opposite to the latter; a contact stud extending forwardly from said rear extremity, said first contact having a cylindrical surface said contact stud terminating in the path of said surface so that the latter will slide past said stud while flexing said spring as said two hands pass each other; and

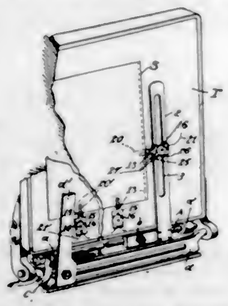
means for placing said contacts in an electric signal circuit.

2,100,215
CIRCUIT BREAKER CONTROL SYSTEM
Alan E. Henninger, South Ardmore, Pa., assignor to General Electric Company, a corporation of New York
Application July 29, 1936, Serial No. 93,241
5 Claims. (Cl. 175—294)



1. In combination, a supply circuit, a supply bus, a circuit breaker between said supply circuit and said bus, a load circuit, a second circuit breaker connecting said load circuit to said supply circuit, a relay responsive to a predetermined abnormal condition in said load circuit, means for maintaining said relay in its operated position after said predetermined abnormal condition has been removed from said load circuit, means responsive to the operation of said relay for effecting the opening of said first-mentioned circuit breaker and the subsequent opening of said second circuit breaker, means responsive to the opening of said second breaker for restoring said relay to its normal position, and means responsive to the restoration of said relay to its normal position for reclosing said first-mentioned circuit breaker.

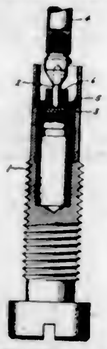
2,100,216
VENDING MACHINE
Philip C. Hughes, Brooklyn, N. Y.,
Application June 10, 1936, Serial No. 84,403
4 Claims. (Cl. 221—123)



2. A vending machine including a support, an article carrying bowl carried by said support,

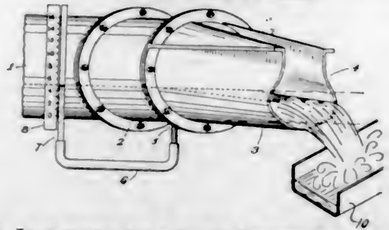
spring actuated means for rotating said bowl, said bowl being formed with an opening in the center of its bottom, manually actuated means for causing said spring actuated means to function, an article discharge chute extending

through the opening in the bottom of said bowl for directing an article to a discharge point, and an article discharge member having a spiral passageway for guiding articles to said discharge chute as said bowl rotates.



2,100,217
PRINTER'S GAUGE
Herbert F. Johnson, Pittsfield, Mass.
Application March 11, 1937, Serial No. 130,341
8 Claims. (Cl. 101—415)

1. A gauge for use as a side gauge, adapted to be adjustably supported on an arm having a movement imparted thereto in a direction to and away from the side of the sheet to be printed, means between the base of the gauge and the arm to guide the gauge along the arm for adjustment thereof longitudinally and transversely, means to clamp the gauge in said adjusted position, and means connected with the gauge to engage in a slit cut in the tympan sheet to hold the arm and gauge in movable contact with the tympan sheet.

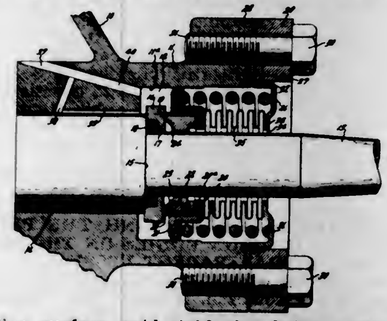


2,100,218
METER PIVOT
Floyd C. Kelley, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application June 20, 1935, Serial No. 27,615
5 Claims. (Cl. 308—159)

1. A pivot consisting substantially of about 20% to 35% of metal from a group consisting of tungsten and molybdenum and about 80% to 65%

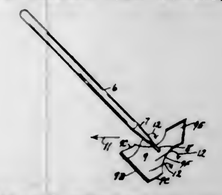
of metal from a group consisting of cobalt and nickel.

2,100,219
OPEN NOZZLE
Karl R. Kennison, Newton, Mass., assignor to Builders Iron Foundry, Providence, R. I., a corporation of Rhode Island
Application December 23, 1935, Serial No. 55,824
8 Claims. (Cl. 73—215)



1. In a meter for a liquid flowing from a conduit, an open-nozzle attachable to said conduit and having a trough-like portion shaped at its entrance to align with the said conduit and thence narrows to its outlet, the lower edge of said outlet being no higher than the bottom line of said conduit and upper portion of said outlet being a top-open slot with vertical walls, the said trough-like portion being arranged to progressively alter the cross sectional area of the stream of said liquid relative to that at a given point in said conduit with increase in the depth of said liquid therein.

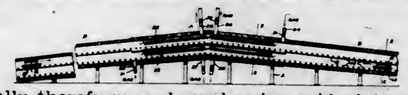
2,100,220
SHAFT SEAL
Ralph E. King, Fort Wayne, Ind., assignor to General Electric Company, a corporation of New York
Application October 24, 1936, Serial No. 107,434
3 Claims. (Cl. 286—11)



1. A shaft seal comprising a casing provided with a shaft aperture, a rotatable shaft extending through said aperture and provided with a transverse sealing surface, a supporting collar provided with a recess therein, a resilient annulus positioned in said recess and having a sealing face engaging said sealing surface, a rigid ring positioned in said recess adjacent said resilient annulus and having a sealing face engaging said sealing surface, means including a portion of said resilient annulus interposed between said rigid ring and said supporting collar for sealing said

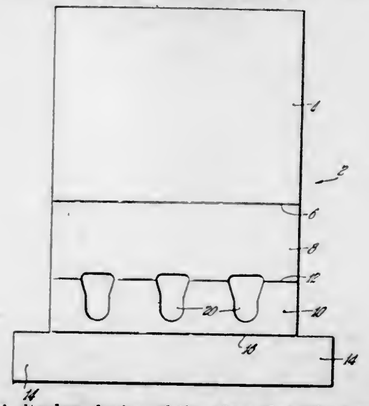
rigid ring to said supporting collar and for yieldably mounting said rigid ring in said recess to accommodate aligning movements thereof with respect to said sealing surface, means including a spring for pressing said resilient annulus and said rigid ring in sealing engagement with said

sealing surface, said rigid ring being arranged to carry a major portion of the thrust upon said sealing surface, and means including an imperforate resilient bellows extending between said supporting collar and said casing for sealing said supporting collar to said casing.



2,100,221
WEEDING AND CULTIVATING TOOL
James C. Kofoed, Northfield, Minn.
Application July 15, 1936, Serial No. 90,652
1 Claim. (Cl. 97—66)

In a weeder and cultivating implement including an elongated handle bar, a metal stem extending forwardly integrally from an end thereof, a cutter blade of flat metal rigidly fixed to the outer end of said stem in a plane at right angles and transversely of the handle bar; said blade comprising a hoe part extending in an arcuate plane to one side of said stem and its outer end comprising a transverse beveled cutting edge, said blade extending on the opposite side of the stem in the form of an arrow head pointed outwardly and having beveled cutting edges from its tip to its widest part, said blade further being formed with continuous arcuate side edges intermediate its arrow shaped head and the cutting edge of the hoe part to form a narrow neck in vicinity of the stem and flaring thence outwardly at opposite sides to the side edges of the hoe part, for the purpose set forth.

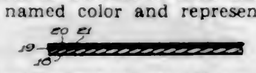


2,100,222
ENAMELING FURNACE
James L. McFarland, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application September 23, 1936, Serial No. 102,152
6 Claims. (Cl. 25—142)

1. A furnace having a heat transfer section comprising superposed chambers, means for supporting and moving material therein having different temperatures in the different chambers and a baffle separating said chambers comprising spaced horizontal plates and a plate spaced verti-

cally therefrom and overlapping said plates for preventing dirt from falling from the upper chamber into the lower chamber but providing a free passage for the exchange of the atmosphere in said chambers.

2,100,223
DISPLAY DEVICE
William Reed, Springfield, Mass.
Application April 22, 1936, Serial No. 75,784
2 Claims. (Cl. 206—79)

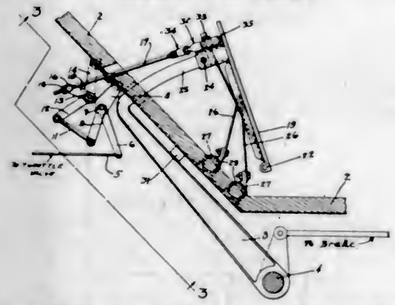


1. A display device of the class described comprising in combination, a substantially flat and vertically-disposed body member, a substantially flat and horizontally-disposed ledge member extending forwardly from the forward face of said body member at a point intermediate its upper and lower marginal edges, and a connecting member extending downwardly from said upper marginal edge of the body member to the forward marginal edge of the ledge member so as to form therewith a hollow support, said connecting member being provided with an enlarged opening adjacent its connection with the ledge member and said ledge member being provided with a rearwardly tapering opening which leads into said enlarged opening, all adapted and arranged whereby an object may be introduced into said enlarged opening and moved rearwardly into said tapering opening so as to be supported within said hollow support by the portions of the ledge member surrounding said tapering opening.

2,100,224
COLOR PHOTOGRAPHY
Francis H. Snyder and Henry W. Rimbach, New York, N. Y., assignors to Francis H. Snyder, Inc., New York, N. Y., a corporation of Delaware
Application February 26, 1935, Serial No. 8,344
2 Claims. (Cl. 95—2)

1. The process of color photography which comprises producing on an emulsion carried by a

paper sheet a positive which is in a color representing a reproduction of the tone values of the corresponding color of the subject, producing a plurality of other positives each of which is in a transparent or translucent color different from said first named color and representing a re-

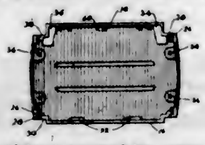


production of the tone values of the corresponding color of the subject, coating the paper sheet with a water proofing material, and successively superimposing and registering such other positives in a wet condition on said first named positive with said emulsion in a wet condition.

2,100,225
OPERATING MECHANISM FOR AUTOMOTIVE VEHICLES

Henry E. Stein, Mankato, Minn.

Application December 18, 1936, Serial No. 116,559
9 Claims. (Cl. 192—3)

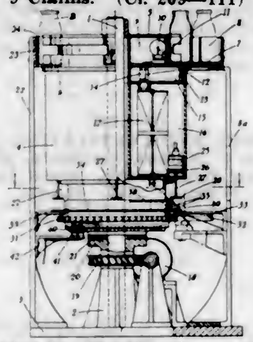


1. The combination with an automotive vehicle comprising a throttle and a brake, of an operating mechanism for said throttle and brake comprising a brake pedal and a throttle pedal disposed in a common plane, whereby the driver may shift his foot from one pedal to the other with a minimum of movement, means carried by the brake pedal for transmitting motion from the throttle pedal to the throttle, but which means has no effect upon the throttle when the brake pedal is actuated, means whereby the throttle pedal can be operated to open the throttle only when the brake pedal is substantially in its normal inoperative position, and means convenient to the driver's seat for limiting the opening of the throttle whereby the vehicle cannot be driven beyond a predetermined speed.

2,100,226
COMPOSITION PANEL CABINET ASSEMBLY PARTICULARLY ADAPTED FOR USE IN MOLDED RADIO CABINETS

Knut Eskid Birger Stenberg, Attleboro, Mass., assignor to Associated Attleboro Manufacturers, Inc., Attleboro, Mass., a corporation of Massachusetts

Application March 11, 1937, Serial No. 130,364
2 Claims. (Cl. 312—7)



2. A radio cabinet assembly, comprising molded composition integral U-shaped top and end panels having aligned molded grooves at the front and rear edges of said top and end panels, and front and rear panels having tongues at the top and end edges thereof, whereby said front and rear panels may be assembled by sliding said tongues upwardly in said grooves, the removable front and rear panels having lugs substantially vertically equidistantly spaced from the lower ends thereof and the end panels having lugs substantially equally equidistantly spaced from the lower ends thereof having screw holes for detachable securement of a chassis base thereto insertable from underneath, whereby on securement of a chassis base thereto, said chassis base may abut the lugs on the removable front and rear panels to retain said front and rear panels with said U-shaped panel in assembled relationship.

2,100,227
APPARATUS FOR DETECTING THE PRESENCE OF FOREIGN BODIES ON THE BOTTOMS OF TRANSPARENT VESSELS

Norman Parker Stoate, Kew Gardens, and William Albert Robinson, Wembley Hill, England; said Robinson assignor to said Stoate

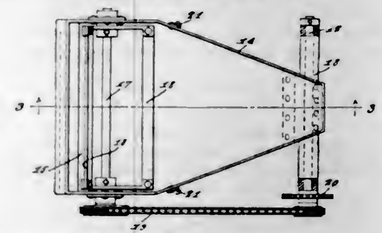
Application January 28, 1936, Serial No. 61,254
9 Claims. (Cl. 209—111)

1. Apparatus for detecting the presence of foreign bodies on the bottoms of transparent vessels comprising in combination a support for a vessel, said support having a narrow scanning slit formed therein having an area small relatively to that of the bottom of the vessel and a length substantially equal to the radius of the vessel, a light-sensitive device disposed beneath the support, a source of light disposed to direct its light through the bottom of the vessel onto the slit, means for rotating the vessel about its longitudinal axis whereby the entire surface is scanned, means operable under the control of the light-sensitive device to give a signal or indication when the light falling on the light-sensitive device is reduced below a predetermined value, and means for preventing operation of the indicating means due to the passage of the walls of the vessel across the scanning slit.

2,100,228
PROCESS FOR THE DEALKYLATION OF ALKYL-ARYL ETHERS

John M. Tinker, Penns Grove, and Viktor M. Weinmayr, Pitman, N. J., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application May 27, 1936, Serial No. 82,150
8 Claims. (Cl. 260—154)



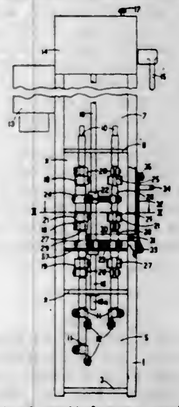
1. The improvement in a process of dealkylation of aryl alkyl ethers which comprises heating an aryl alkyl ether in the presence of an aliphatic amine hydrohalide until dealkylation is at least partially complete.

7. A process for the preparation of pyrocatechol from guaiacol which comprises heating guaiacol in the presence of trimethylamine and gaseous hydrochloric acid until demethylation of the guaiacol is at least partially complete.

2,100,229
SKIP FOR CONCRETE MIXERS

James E. Van Orden, Acra, N. Y.

Application January 13, 1936, Serial No. 58,953
4 Claims. (Cl. 83—73)

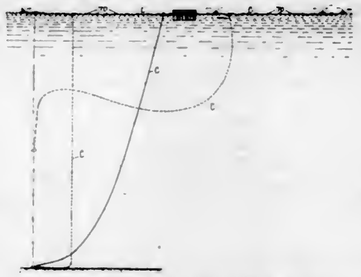


2. A skip of the character described comprising a trough-like body having a chute end, and a receiving mouth and lip, a shaft journaled with the body for swingingly supporting the latter, a bladed cleaning and mixing wheel rotatably arranged within the body adjacent said mouth, driven connections between the shaft and said wheel, means for raising and lowering said body, connections with a power unit for driving said shaft, and a stop disposed within the body between the lip and the wheel and overhanging a portion of the wheel which is disposed adjacent the lip.

2,100,230
ELECTRICAL SWITCH GEAR

George Ethelbert Whitehead, Cardiff, South Wales

Application September 18, 1936, Serial No. 101,507
In Great Britain October 23, 1935
3 Claims. (Cl. 175—298)



1. An electrical switchgear unit for moderate voltages comprising a vertical framework, horizontal cross-partitions dividing said framework into three superimposed compartments, transverse busbars contained in one of the end compartments and having rod-like circuit breaker terminal stems directly connected therewith, rod-like circuit breaker terminal stems contained in the remote compartment and adapted to be connected with cable ends, and a circuit breaker contained in the middle compartment and having pairs of fixed contacts, the members of each pair of fixed contacts being in vertical alignment, and moving bridge contacts comprising longitudinal rods and a spider carrying said longitudinal rods, said spider being rotatable on a vertical axis, each moving contact rod being in line with the terminal stems of a pair of fixed contacts when the circuit breaker is closed and giving a straight through electric circuit disposition.

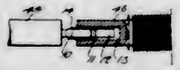
2,100,231
SEA BOTTOM ANCHOR SYSTEM AND METHOD OF PLACING THE SAME

Edward R. Armstrong, Hollyoak, Del.

Application June 19, 1934, Serial No. 731,380
15 Claims. (Cl. 114—0.5)

3. A deep-sea-anchor comprising an externally smooth and upwardly convex top wall having a peripheral shoe and a central aperture, a bottom wall, a peripheral closing wall spaced inwardly from said shoe, a cable securing means located inside said walls, and a conical wall extending from said means to the top wall for closing said aperture, said walls providing a buoyancy chamber.

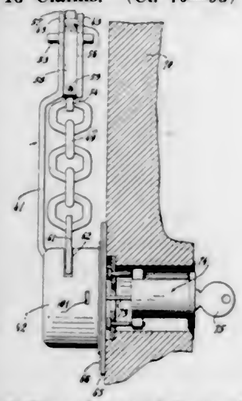
8. The method of placing a deep-sea-anchor device upon the sea floor, said device including an anchor cable and an anchor having a buoyancy chamber by which it is floated, which comprises buoyantly moving the anchor to the desired latitude and longitude, buoyantly supporting the anchor cable at a plurality of points along its length with the cable extended and connected to an end buoy, flooding the buoyancy chamber and rendering the anchor non-buoyant and simultaneously releasing the cable along its length so that the anchor and cable drop simultaneously, and retarding the descent of the anchor and the adjacent portion of the cable to a rate substantially equivalent to that of the descent of the remainder of the cable to prevent fouling of the cable.



2,100,232
FLEXIBLE COUPLING FOR RADIO VOLUME CONTROL OR THE LIKE

Gerald J. Barry, Philadelphia, Pa., assignor to Philco Radio & Television Corporation, Philadelphia, Pa., a corporation of Delaware

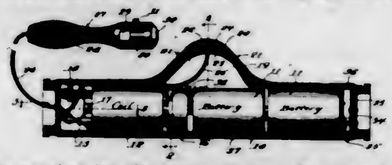
Application May 19, 1936, Serial No. 80,630
3 Claims. (Cl. 64—15)



1. A flexible shaft coupling for a radio volume control or the like, comprising a pair of electrically-conductive members having interlocking portions forming a flexible joint, one of said portions comprising a non-circular part and a projection extending therefrom, the other of said

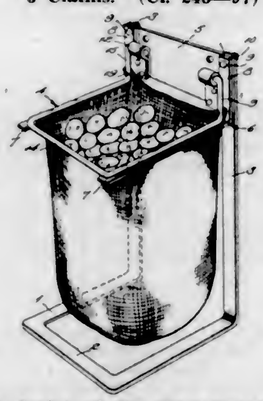
portions having a non-circular recess to receive said part and another recess to receive said projection, and an electrically-conductive resilient spring extending about said part and having an aperture through which said projection extends, for preventing angular movement of said mem-

bers relative to one another while permitting axial misalignment of said members, and for forming a good electrical joint between said members, said projection serving to hold said spring in place and cooperating with said other recess to interlock said members.



2,100,233
AUTOMATIC CHAIN LOCK
Eugene P. Beaumont, New York, N. Y., assignor to Whiting Manufacturing Company, Minneapolis, Minn., a corporation of Minnesota
Application September 29, 1936, Serial No. 103,099
18 Claims. (Cl. 70—93)

1. In a lock for a door and its jamb, the combination of, a chain secured at one end whereby it remains mounted on one of them, a pair of members, each adapted to admit and engage the free end of the chain, mounted on the door and jamb respectively, one fixed and the other pivoted; the free end of the chain being removably engaged in one of said members, a key-operative means adapted to be actuated from the outside surface of the door for swinging the pivoted member whereby the free end of the chain is conveyed to leave the said member with which it is in engagement, and to enter and become engaged by the other of said members to effect or remove a chain connection between the door and jamb, locking means adapted to removably engage the pivoted member to fix its position, and means actuated by said key-operative means to motivate said locking means to fix the position of the pivoted member after a chain connection has been effected or removed and to release said pivoted member at each commencement of operation of said key-operative means.

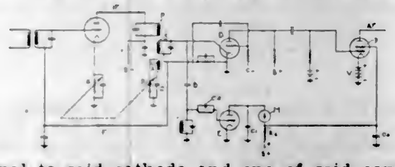


2,100,234
MASSAGING DEVICE
Gardner A. Belknap, Conneautville, Pa.
Application May 21, 1936, Serial No. 81,116
2 Claims. (Cl. 128—24.5)

1. A massaging device comprising an elongated casing, means in the casing for supplying an oscillating current, a hollow projection intermediate the ends of the casing on one side of the casing gradually increasing in length from its upper to its lower end and having slightly convex upper end and front and rear edges, an elec-

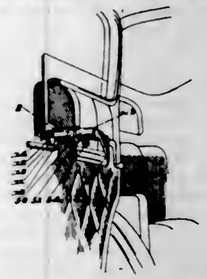
trode carried by the projection and exposed at the top of the projection and electrically connected to said means, and a dirigible electrode connected to said means and applicable adjacent the first named electrode to the person of the user.

2,100,235
SACK HOLDER
Milo Brown, Blackfoot, Idaho
Application April 20, 1936, Serial No. 75,460
3 Claims. (Cl. 248—97)



1. In a device of the character described, a base section comprising a U-shaped base having a pair of legs, a pair of spaced apart uprights connected to said legs, and a clamping section secured to said uprights and comprising a pair of brackets, respectively, each including a horizontally disposed arm overlying the corresponding leg of the base and a vertically disposed end arm parallel to the corresponding upright, a bail pivotally mounted intermediate the upright arms and comprising side arms adapted to be swung into clamping relation to said horizontal arms, and right angled end arms adapted to be swung into clamping relation to said upright arms, said bracket arms and bail arms being provided with apertures and pins, respectively, disposed for mating relation.

2,100,236
INTERCARRIER NOISE SUPPRESSOR
Reynolds D. Brown, Jr., Philadelphia, Pa., assignor to Philadelphia Storage Battery Company, Philadelphia, Pa., a corporation of Pennsylvania
Application May 8, 1935, Serial No. 20,477
In Great Britain May 14, 1934
4 Claims. (Cl. 250—20)



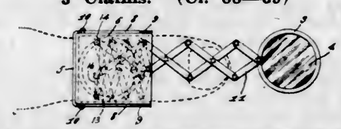
1. In a superheterodyne radio receiver, an intermediate frequency amplifier for amplifying

modulated intermediate frequency carrier signals, a branch circuit comprising at least one sharply tuned circuit energized by said intermediate frequency amplifier, rectifying means energized by said intermediate frequency amplifier for demodulating said modulated signal, an audio frequency amplifier comprising at least one space discharge device having an anode, a cathode and two control elements, means for supplying said demodulated

signal to said cathode and one of said control elements, a second rectifying means connected to said branch circuit and having an output circuit wherein there is obtained a signal dependent upon said carrier signal amplitude, and means including filter means for supplying said last named signal to said cathode and said other control element so as to reduce the amplification of said audio frequency amplifier when said carrier signal amplitude is less than a predetermined value.

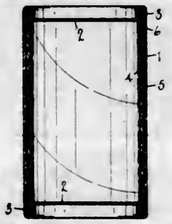
2,100,237
DOOR LOCK
Simon Bubes, Chicago, Ill.
Application March 13, 1937, Serial No. 130,767
6 Claims. (Cl. 292—352)

1. In a door latch, a casing, a rotatable member adapted to be connected to an operating part of a door lock and mounted in said casing, a shaft loosely mounted for rotation in the rotatable member, a door handle connected to the outer end of the shaft, a sleeve slidably mounted on the member and rotated by said member, cooperating means on the shaft and sleeve for operatively connecting the rotatable member with the shaft, a spring for maintaining the sleeve out of engaging relation with the connecting means on the shaft, and means for retaining the sleeve in engagement with said connecting means so that the handle may operate the rotatable member.



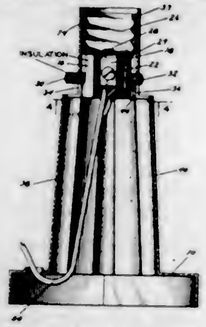
2,100,238
METALLIC EXPANSION JOINT
John I. Burgess, Fort Worth, Tex.
Application April 8, 1936, Serial No. 73,366
2 Claims. (Cl. 20—6)

1. In an expansible leak proof joint, the combination with a pair of spaced, parallel inner side edgewise aligned body sections of a structure, said sections being formed in opposed side edges with aligning oppositely disposed semi-circular grooves intermediate the upper and lower ends of said edges, said sections being formed in their upper faces with grooves adjacent and parallel to said side edges, and a continuous jointing element provided at its inner end with an anchoring part in the form of a split bulbous tubular portion having its outer face snugly engaging throughout the walls of said semi-circular grooves, a pair of vertically disposed spaced parallel stems merging at their lower ends into the split ends of said portion and having their outer faces bearing



throughout against said side edges from the top of said portion to the upper end of said edges, a pair of oppositely disposed outwardly extending flat wings merging at their inner sides into the outer ends of and disposed at right angles to said stems, the inner faces of said wings seating throughout upon the upper face of said sections, and a pair of downturned vertical straight flanges integral at their upper ends with the outer sides of said wings and extending into said grooves in the upper faces of said sections.

2,100,239
MAGNIFYING GLASS
Paul C. Carlton, Baldwin, Md.
Application July 7, 1936, Serial No. 89,393
3 Claims. (Cl. 88—39)

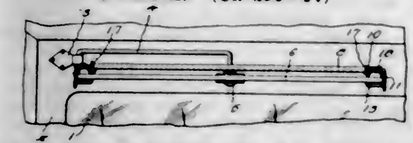


1. A magnifying device comprising a glass, a housing therefor, a band having the housing rotatably secured thereto, means for attaching the band to the hand of the user, extensible means for connecting the glass to the housing for movement of the former into and out of the latter, and universal connecting means between the glass and the extensible means.

2,100,240
CONTAINER
Julius N. Cayo, Benton Harbor, Mich.
Application April 23, 1936, Serial No. 75,986
1 Claim. (Cl. 229—5.5)

A mailing tube or package comprising an inner body of spirally wound low grade paper tube, an outer layer of kraft paper wrapped thereon in concentric layers and projecting beyond the end of the spiral tube to form shoulders, and flanged heads for said container bottomed against the ends of the inner tube with the projecting ends of the kraft paper layer bent and crimped over the flanges of the heads, whereby the heads are retained in place by the folding and crimping of the kraft paper.

2,100,241
ELECTRIC LAMP SUPPORT
Roy H. Cunningham, Fairfield, Conn., assignor to The Bryant Electric Company, Bridgeport, Conn., a corporation of Connecticut
Application July 24, 1936, Serial No. 92,430
3 Claims. (Cl. 240—81)



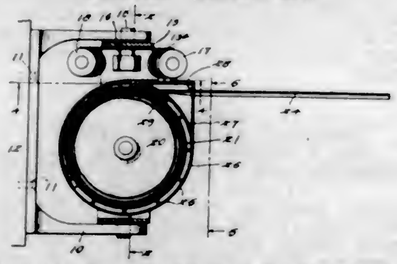
3. In combination, an electric lamp socket having an insulating base, lamp receptacle contacts and switch mechanism mounted on said base, a rigid switch operating member projecting from said base, in combination with a thin walled standard of molded insulating material, said standard comprising a hollow column having a substantially cylindrical top portion closely fitting said socket base and being slotted to permit extension of said operating member therethrough, said column being enlarged to permit the insertion of said socket base into said top portion through the column, said column having an opening adjacent said top portion and communicating with the slotted area of said top portion whereby said operating member may move out of said column as said socket base moves into said top portion.

2,100,242
PREPARATION OF 2-CHLORO-5-AMINO-BENZOIC ACID
Robert Freeman Deese, Jr., Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application June 5, 1936, Serial No. 83,812
5 Claims. (Cl. 260—109)

1. The process of producing 2-chloro-5-amino-benzoic acid which comprises nitrating ortho-chloro-benzoic acid, reducing the resulting chloro-nitro-benzoic acids to the corresponding chloro-amino-benzoic acids, and separating the 2-chloro-5-amino-benzoic acid from an aqueous acidic medium maintained at a pH within the range of 2.5 to 3.5.

2,100,243
AUXILIARY GLARE SHIELD
Frederick C. Doody, St. Onge, S. Dak.
Application March 9, 1937, Serial No. 129,899
8 Claims. (Cl. 296—97)

5. An auxiliary glare shield, comprising a clamping unit for securing the shield to a support and consisting of a frame having a longitudinal side bar and end bars and clamping arms pivotally coupled with the frame at its ends and having co-acting clamping relation with said end bars, a shield frame having hinge connection with the unit, and a transparent panel of material in the frame having the capacity to intercept undesirable light rays.

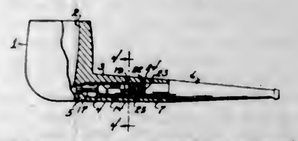


2,100,244
WITHDRAWN

2,100,245
FIGURE TOY
Edgar W. J. Fagan, Brooklyn, N. Y., assignor of one-half to Adam G. George, New York, N. Y.
Application August 31, 1936, Serial No. 98,766
1 Claim. (Cl. 272—52)

A figure toy in the form of a horse and comprising a flat body, front and rear legs pivotally secured to the body upon opposite sides thereof, means connecting the front legs with the rear legs for movement thereof in unison, a head and a neck and the latter fixed to the pivot of the front legs for movement therewith, parallel front and rear flat supporting braces for the user of the toy, said braces being slotted from their lower ends to straddle the body and secured to and rising therefrom, a pair of straps having one of their ends secured to the rear brace and having spaced openings extending longitudinally in the opposite end portions thereof, hook means secured to the front brace to be received in the openings for adjustably securing the straps thereto, and said straps adapted for disposal about the shoulders of the user for the latter to carry the toy with the legs of the user straddling the body.

2,100,246
TRAFFIC SIGNAL
Raymond W. Glawe, Acampo, Calif.
Application July 28, 1936, Serial No. 93,109
4 Claims. (Cl. 177—327)



1. A signalling device of the class described comprising a frame, means pivotally mounting said frame, an extensible signalling means carried by the frame comprising a drum, a normally arcuate flexible signalling member having a portion wrapped flat about the drum, means providing an opening arcuate in cross section adjacent to the drum, one end of said signalling member being fastened to the drum and the other end being free and so disposed as to be projected through said arcuate opening, an electric motor on the frame operable to extend said signalling means, and mechanism operable to energize the motor and to actuate the frame pivotally to vary the position of the signalling means.

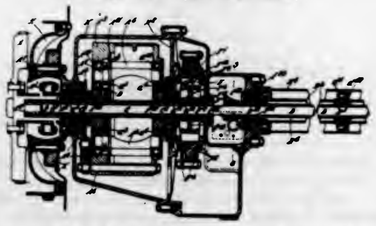
2,100,247
CABINET TABLE
Earl C. Groves, Jetmore, Kans.
Application November 21, 1935, Serial No. 50,951
2 Claims. (Cl. 38—113)

2. A cabinet table comprising a cabinet including a top and side walls having portions extending above the top, a table top pivoted on the cabinet and swingable to a horizontal position upon the extended side wall portions to form a chamber, an ironing board located in its substantial entirety in the chamber, a pin projecting from the board, a single bracket at one end of the chamber having pivotal connection between the board and cabinet top and located in a plane which is at an acute angle to an edge of said top, a pair of brackets adjacent the other end of the chamber pivoted on the cabinet top and in planes which are at angles to each other, the free ends of the last-mentioned brackets being provided with eyes aligning with each other and receiving the pin on the board when the board is raised to the working position by swinging the single bracket to an upright position with respect to the top, thereby retaining the pair of brackets in a vertical position, all of said brackets assuming a resting position on the cabinet top when the board is swung down with the single bracket into the lowered and non-working position.

2,100,248
TOBACCO PIPE
Raymond F. Hallstein, Philadelphia, Pa.
Application December 11, 1936, Serial No. 115,432
4 Claims. (Cl. 131—12)

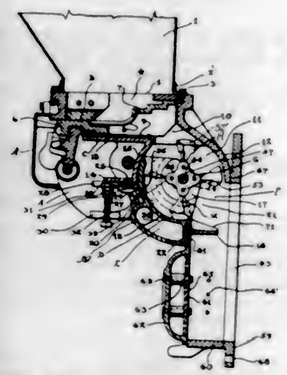
1. A tobacco pipe comprising a bowl, a stem for the bowl having a passage communicating with the bore thereof, a mouth piece received in the stem, movable means on the mouth piece, means carried by the movable means and movable through the passage to remove obstructions therefrom upon rotation of the mouth piece in one direction, expansible and contractable means on the mouth piece and acted upon by the movable means to be expanded in binding engagement with the stem upon rotation of the mouth piece in an opposite direction for securing the latter to the stem.

2,100,249
NECK FOR MUSICAL INSTRUMENTS
Guy Hart, Kalamazoo, Mich., assignor to Gibson, Inc., Kalamazoo, Mich.
Application August 25, 1937, Serial No. 160,762
8 Claims. (Cl. 84—293)



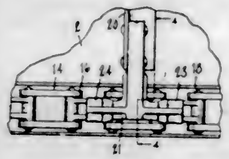
8. A neck for stringed instruments comprising a body member having a longitudinal channel in the upper side thereof, a metal insert disposed in the bottom of said channel, a truss rod disposed on said insert, and a filler strip secured in said channel above said truss rod.

2,100,250
PROTECTIVE COATING FOR TENNIS STRINGS AND THE LIKE
George Victor Heyl, Chicago, Ill., assignor to Johnson & Johnson, New Brunswick, N. J., a corporation of New Jersey
No Drawing. Application December 31, 1934, Serial No. 760,051
3 Claims. (Cl. 149—1)



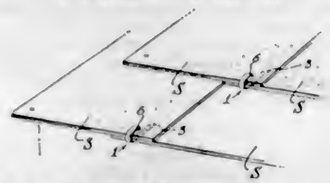
1. A tennis string having a protective coating comprising an organic colloid and a substance calculated to transmit oxygen upon exposure to air whereby it is substantially self curing, said substance comprising the reaction product of ammonia with the hydroxide of a suitable divalent metal.

2,100,251
AUTOMATICALLY VARIABLE POWER TRANSMISSION MECHANISM
Howard Frederick Hobbs, Leamington Spa, England
Application January 23, 1936, Serial No. 60,471
In Great Britain December 29, 1933
5 Claims. (Cl. 74—260)



1. A power transmission mechanism comprising a driver shaft, a driven element, planet pinions carried by the driver shaft, at least one set of planetary weights carried by said planet pinions, a sun-gear meshing with said planet pinions, an intermediate rotary tubular shaft, means for preventing said intermediate tubular shaft rotating other than in a desired direction, said sun-gear being mounted on said intermediate tubular shaft, and a resilient device mounted within said intermediate tubular shaft and resiliently connecting said intermediate tubular shaft to said driven element.

2,100,252
MECHANICAL STOKER
Jerome A. Hoffman, Detroit, Mich., assignor to Hoffman Combustion Engineering Company, Detroit, Mich., a corporation of Michigan
Application May 29, 1934, Serial No. 728,186
15 Claims. (Cl. 110—115)



11. A delivering mechanism for a stoker including a casing having a fuel inlet and a fuel outlet, means in said casing for distributing and discharging fuel through said outlet, said casing including a lower adjustable portion having a chamber for the passage of air therethrough under pressure to cool said lower adjustable portion, said lower adjustable portion having a discharge shelf and an air outlet from said chamber above said shelf, and means for adjusting said lower casing portion and holding the same in adjusted position.

2,100,253
CONVEYER MECHANISM
Robert W. Irwin and Cornelius M. Herz, Grand Rapids, Mich.
Application June 19, 1936, Serial No. 86,104
7 Claims. (Cl. 198—175)

1. A kiln with smooth flat floor from end to end, movable support adapted to travel said floor and carry articles to be dried, channel guides at each side thereof, endless sprocket chains running over sprocket wheels at each end, the upper runs of which travel in said guides, removable push bars with detachable attaching brackets at each end, each having a square projecting tooth adapted to engage between the links of the sprocket chains at each side and adapted to be pushed from said engagement by the sprocket wheels at the end of the run, whereby the push bars are released by the sprocket wheels after completing the travel of the kiln, a guide channel disposed under the first mentioned channel for the return run of the chain disposed upon the foundation upon the first run of the channel.

2,100,254
CLIP FOR FASTENING ROOFING
Bernie C. Krider, Flint, Mich.; Philip W. Krider administrator of said Bernie C. Kridler, deceased
Application April 10, 1935, Serial No. 15,677
5 Claims. (Cl. 108—33)

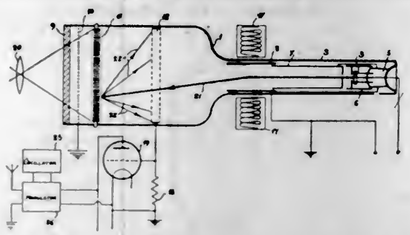
1. A clip of the type described comprising a relatively long lower leg, an upstanding shoulder of a height equal to the thickness of at least two shingles, an upwardly slanting upper leg, and a downturned pointed end substantially straight so it can be driven into the shingles, and in which said upper leg terminates and which is only of sufficient length to engage the outer shingle only.

2,100,255
METHOD OF MAKING COMPOSITE BODIES OF ZINC AND ALUMINUM
Clayton E. Larson, Louisville, Ky., assignor to Reynolds Metals Company, New York, N. Y., a corporation of Delaware
No Drawing. Application January 28, 1936, Serial No. 61,252
15 Claims. (Cl. 29—189)

1. In the method of making aluminum coated zinc plates, sheets, foils, and other bodies having an aluminum coating at opposite sides of a zinc core, the steps which include applying molten zinc to that face of the aluminum which is to constitute the inner face of an aluminum envelope while breaking down the aluminum oxide film on said face to form a predetermined layer of zinc aluminum alloy, forming the aluminum into an envelope for a billet or the like, fusing a core of zinc to said alloy within said envelope, and then subjecting said billet or the like to successive rolling operations to increase its surface area without destroying the bond between the aluminum and zinc.

2,100,256
METHOD OF MAKING COMPOSITE BODIES OF ZINC AND ALUMINUM
Clayton E. Larson, Louisville, Ky., assignor to Reynolds Metals Company, New York, N. Y., a corporation of Delaware
No Drawing. Application February 8, 1936, Serial No. 63,030
4 Claims. (Cl. 29—189)

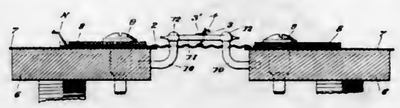
4. The method of forming malleable and ductile aluminum coated zinc having an aluminum zinc bond of relatively thin and substantially uniform and predetermined thickness which does not penetrate to the surface of the aluminum, said method including the steps of forming on the surface of an aluminum coating sheet a relatively thin layer of zinc aluminum alloy while breaking down the aluminum oxide film at the surface of the aluminum and controlling the thickness of said alloy layer by the temperature of the metal and the amount of work applied thereto, and then causing cohesion of the zinc of said layer to the zinc core metal by rolling the coating and core metals together under a pressure that causes interlocking of the contacting zinc faces and under a temperature that leaves the zinc aluminum alloy of substantially its original thickness whereby the resulting bond remains relatively thin and of predetermined thickness and the laminated metal is malleable and ductile, and thereafter working said laminated metal to reduce the cross section thereof without disrupting said bond.



2,100,257
COMPOSITE BODY OF MAGNESIUM AND ALUMINUM, AND METHOD OF MAKING SAME
Clayton E. Larson, Louisville, Ky., assignor to Reynolds Metals Company, New York, N. Y., a corporation of Delaware
No Drawing. Application February 8, 1936, Serial No. 63,031
15 Claims. (Cl. 22—203)

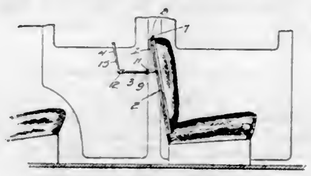
5. The method of forming laminated billets and other bodies of aluminum coated magnesium which includes the steps of forming a sheet of aluminum, forming an alloy layer at the face of said sheet which is to be united to the magnesium, and fusing to said alloy layer a magnesium core to form an alloy bond of substantially uniform character and predetermined depth throughout the contiguous surfaces of said metals.

2,100,258
COMPOSITE BODY OF COPPER AND ALUMINUM OR COPPER AND MAGNESIUM, AND METHOD OF MAKING SAME
Clayton E. Larson, Louisville, Ky., assignor to Reynolds Metals Company, New York, N. Y., a corporation of Delaware
No Drawing. Application February 15, 1936, Serial No. 64,180
16 Claims. (Cl. 29—189)



1. The method of forming laminated billets and other bodies of copper coated aluminum or magnesium which includes the steps of forming an alloy of zinc and copper at the inner face of a copper envelope, and casting aluminum or magnesium into said envelope into direct contact with said alloy to form therewith a substantially continuous zinc alloy bond between said copper and said aluminum or magnesium.

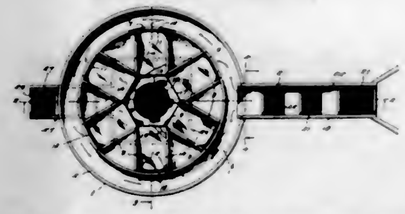
2,100,259
TELEVISION
James Dwyer McGee, Ealing, London, England, assignor to Electric and Musical Industries Limited, Hayes, Middlesex, England, a company of Great Britain
Application May 3, 1934, Serial No. 723,633
In Great Britain May 5, 1933
8 Claims. (Cl. 178—6)



8. Television and like transmitting apparatus comprising an evacuated envelope containing a mosiac screen and an electron gun for directing a beam of electrons upon said screen, said screen having a first surface directed towards said electron gun and a second surface facing away from said electron gun and being formed of a multiplicity of elements each comprising a conductor having two opposite end faces lying in said surfaces, a coating of photo-electrically active material upon the end faces of said elements which lie in said second surface, insulating means between said conductors and screening means positioned between said conductors and extending over substantially the whole distance between said first and second surfaces, substantially completely electrostatically screening said conductors each from the others.

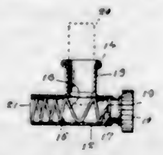
2,100,260
THERMOCOUPLE AMMETER
John H. Miller, Short Hills, N. J., assignor to Weston Electrical Instrument Corporation, Newark, N. J., a corporation of New Jersey
Application September 11, 1936, Serial No. 100,372
8 Claims. (Cl. 171—95)

1. In an ammeter for use at high frequencies, the combination with a millivoltmeter and a thermocouple, of a heater element in heat transfer relationship to said thermocouple, said heater element being tubular and having a wall thickness of the order of not more than 0.004 inch.



2,100,261
LUGGAGE RACK
Edward Montgomery, Knoxville, Tenn.
Application September 28, 1936, Serial No. 103,007
1 Claim. (Cl. 224—29)

A luggage rack comprising a hanger frame adapted to be attached to the front seat of an automobile to depend from the upper edge thereof, bottom and side panels respectively, the first hinged to the hanger frame and each to the other to extend in angular relation, with the side panel opposed to the hanger frame and forming together with the back of the vehicle seat a trough-like container open at both ends, the hanger frame comprising a pair of end arms connected together at their lower ends by a cross rod, the end arms having upwardly directed ends for attachment to said vehicle seat and adapted to suspend said frame along side the back of said seat, the lower ends of the arms being bent outwardly and being formed with hinge sockets, said bottom panel comprising a pair of end arms pivoted at one end to said sockets and forming together with the latter rule hinges between said bottom panel and said frame, the opposite ends of the bottom panel arms being provided with sockets, said side panel comprising a single piece rod



frame comprising an upper cross rod and end arms provided with lower inwardly bent ends pivoted to the last named sockets and forming together with said sockets rule hinges between said side panel and said front panel, and a single piece of upholstery cloth secured at its edges to the cross rod of the hanger frame, to the end rods of the bottom panel, and to the rod-like frame of the side panel, said hinge connections permitting of the bottom panel and side panel unfolding to a limited extent in angular relation to each other and to the hanger frame and permitting the side panel to swing downwardly over the bottom panel and the two panels to be folded on the hanger frame in upstanding position close to the back of said seat.

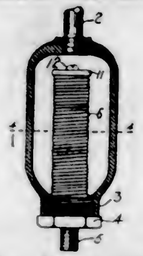
2,100,262
SLUICE BOX AND AMALGAMATION CONCENTRATOR
Albert Lee Moorhead, Klamath Falls, Ore.
Application February 29, 1936, Serial No. 66,491
5 Claims. (Cl. 209—43)

1. A sluice box structure comprising means forming a circular trough into which gold bearing material is washed, said trough having inner and outer walls and a bottom and said inner wall having a plurality of openings therethrough, a plurality of chutes leading from said openings toward the central part of the circular area defined by the trough, a receiver at the center of said area into which the chutes discharge, and an amalgamation plate forming the bottom for each of said inwardly directed chutes over which the said material passes.

2,100,263
COMBINED ASHTRAY AND SNUFFER
Edward C. Moulton, Newburgh, N. Y.
Application April 28, 1936, Serial No. 76,855
1 Claim. (Cl. 131—51)

The combination of a barrel, a knob rotatably fitting one end of said barrel, a mouth extension rising vertically from the barrel and opening thereinto for accommodating a lighted cigarette, and a coil of wire fitted within said knob and snugly confined within said barrel for rotation therein by the knob and having a spread turn for bridging the communication between the mouth extension and said barrel for the snuffing of the lighted end of said cigarette when said cigarette is protruded through the mouth extension into the barrel and into the path of the spread turn.

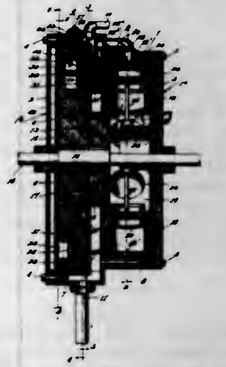
2,100,264
TREATMENT OF METALS AND SLAGS
René Perrin, Paris, France, assignor to Société d'Electrochimie, d'Electrometallurgie et des Aciéries Electriques d'Ugine, Paris, France, a corporation of France
Application May 23, 1934, Serial No. 727,177
In Italy July 11, 1932
27 Claims. (Cl. 75—24)



1. A process for regenerating an oxidized slag in a molten condition which consists in violently intermixing said slag with an agent capable of reducing oxides of the oxidized slag so as to bring said slag to a condition of thorough division and mixing with the reducing agent.

2,100,265
PROCESS FOR THE MANUFACTURE OF METAL ALLOYS
René Perrin, Paris, France, assignor to Societe d'Electrochimie d'Electrometallurgie et des Acieries Electriques d'Ugine, Paris, France, a corporation of France
No Drawing. Application July 8, 1936, Serial No. 89,656. In Italy July 11, 1932
22 Claims. (Cl. 75—122)

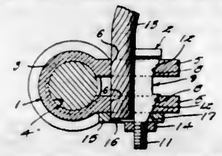
1. A process for the manufacture of a metal alloy which consists in forming a bath of molten fluid slag containing an oxidic compound of the alloying metal to be introduced into the first recited basis metal, forming a bath of this latter metal in the molten state and intermixing with such violent energy and intimacy the said slag and the said basis metal together with a reducing agent capable of reducing the said oxidic compound of the slag as to cause the slag and the reducing agent to become almost instantaneously dispersed in a finely divided condition into the metal, thereby quickly effecting a reduction of the said oxidic compound of the slag and alloying the metal therefrom with the first recited basis metal and allowing the slag so impoverished in its said oxidic compound to separate from the metal alloy.



2,100,266
OIL FILTER
Milton H. Perry, Lansing, Mich.
Application September 14, 1936, Serial No. 100,753
1 Claim. (Cl. 210—169)

In a fluid filter, the combination with a cas-

ing having an outlet tube, an inlet tube arranged axially in the casing and provided with perforations, a series of coils of wire arranged around said inlet tube, said coils being placed one within another, the outermost of said coils being formed of wire greatest in thickness, the innermost coils being formed of wire least in thickness in said series, and the said inlet tube having a top provided with a screw engaging the inlet tube for closing the tops of the coils.

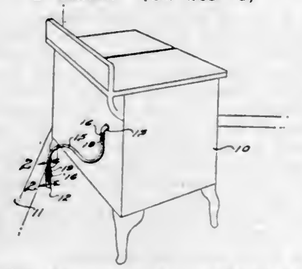


2,100,267
ROTARY COMBUSTION ENGINE
Walter H. Potthast, Manning, Iowa
Application March 17, 1936, Serial No. 69,387
11 Claims. (Cl. 123—14)

4. In a rotary internal combustion engine, a casing, a partition dividing the casing into a rotor chamber and a compressor chamber, a shaft extending through said casing axially of said chambers, a rotor fixed to said shaft and turning in the rotor chamber, said partition being formed with an intermediate chamber communicating with said compressor chamber and closed at one side by said rotor, a compressor in the compressor chamber actuated during rotation of said shaft for successively delivering charges of compressed fuel into the intermediate chamber, said rotor being formed with combustion chambers in its side face opposite from the intermediate chamber and with passages leading from the combustion chambers through the rotor and terminating in position to successively communicate with the intermediate chamber during rotation of the rotor, an opening being formed in a wall of the casing and constituting an exhaust for the combustion chambers, means carried by the rotor for highly recompressing and for forcing fuel from the intermediate chamber through the passages into said combustion chambers, an abutment carried by said casing working in said combustion chambers in succession, and means for exploding fuel in the combustion chambers.

2,100,268
BATTERY TERMINAL POST CLAMP
Frank M. Reynolds, Sanford, Colo.
Application July 7, 1936, Serial No. 89,425
4 Claims. (Cl. 173—259)

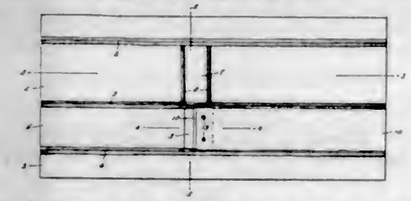
3. A battery terminal post clamp comprising a split annulus adapted to receive the post, a pair of spaced arms extending from the annulus upon opposite sides of the division thereof, said arms having cable receiving apertures therethrough and slots each opening into an aperture, each of said slots having an obliquely directed wall at the end opposite from the cable opening, a bolt extending thru said slots and connecting said arms, a pair of cams forming a part of the bolt and



each having sliding engagement with the obliquely directed slot wall, and a nut carried by the bolt, said nut when drawn up upon the bolt effecting the lateral movement of the bolt through the contact of the cams with said oblique walls.

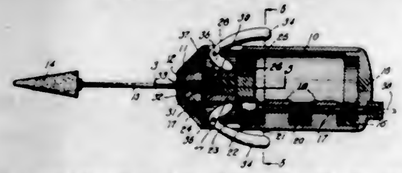
2,100,269
CARD HOLDER
Carroll E. Roche, Cincinnati, Ohio
Application June 10, 1936, Serial No. 84,575
2 Claims. (Cl. 40—16)

2. A card holder, comprising a plate, edges of said plate returned on its intermediate portion and providing recesses for receiving the edges of an identification card, spring clips secured to said plate adjacent opposite sides and within the area of the plate, each of said clips being a tongue of resilient material, secured at one terminal to the plate, and a button on the free end of the tongue providing an enlarged clamping surface, and a marginal flange on said button for engagement by a thumb or finger nail in releasing the clip.



2,100,270
DUCTILE GAS LINE CONNECTER
Joseph C. Romine, Detroit, Mich., assignor to William R. Wilson, Detroit, Mich.
Application July 9, 1937, Serial No. 152,807
1 Claim. (Cl. 285—8)

Means for connecting a household gas stove having a gas inlet line to a gas supply line comprising a solid wall ductile metal tubing having its walls unsupported either externally or internally by auxiliary means extending between the ends of the two lines, and connections releasably but sealingly connecting the ends of the lines to the ends of the tubing, said tubing being of such metal that it may be bent and twisted without damage



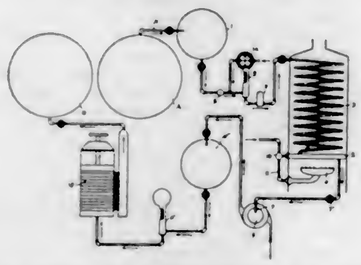
thereto by material cross-sectional deformation and without causing leakage and being of such length that the connections may be made with the stove substantially removed from its final position and then the stove moved to its final position during which the tubing flexes or bends as the ends of the two lines move into positions nearer each other.

2,100,271
CULINARY DEVICE
Rudolph William Rotter, Kent, Wash.
Application December 12, 1936, Serial No. 115,608
3 Claims. (Cl. 146—4)

1. A device as described comprising a sheet metal base, said base having its edges folded under, said base having three lengthwise guides, one of which is a common guide, defining slideways on the face of the base, said slideways having rectangular openings across their lengthened areas, one of the openings having its lengthwise edges projecting upwardly in a converging relation for culinary purposes, and the other having one of its lengthwise edges elevated, and a blade suitably mounted thereon.

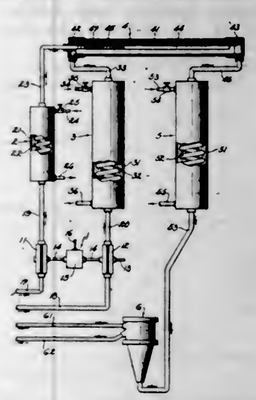
2,100,272
ELECTRIC REVERSIBLE TOOTH BRUSH
Guy R. Sawyer, Glover, Vt., assignor of one-half to B. R. Sherburne, Glover, Vt.
Application September 3, 1935, Serial No. 39,000
3 Claims. (Cl. 74—204)

1. In a device of the class described, a casing forming a handle, angular levers pivoted on opposite sides of the handle and each having a long leg exposed exteriorly of the handle and a short leg entering the interior of the handle, a friction wheel mounted to tilt on an axis transverse to the longitudinal axis of the casing and adapted to be rocked by the levers in a selected direction, there being concentric annular surfaces on the friction wheel, a motor driven shaft entering the handle, and a friction pulley on the shaft between said driving surfaces and engageable selectively with said driving surfaces when said angular levers are selectively manipulated.



2,100,273
SAFETY SIGNAL FOR LOADED GUNS
Martin Skandera, Mohawk, N. Y.
Application October 12, 1936, Serial No. 105,312
1 Claim. (Cl. 42—1)

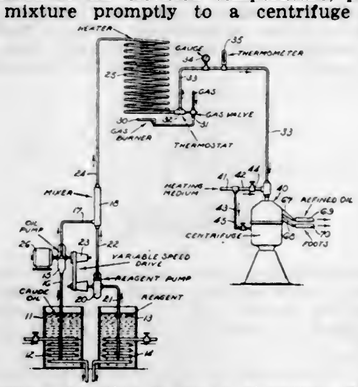
In a signal device to indicate that a gun is loaded, the combination of a barrel having a breech, there being a slot formed in the wall of the breech and extending through the outer face of the breech and also extending to the cartridge chamber of the breech said slot also opening through the rear face of the breech, said slot having the front wall sloped rearwardly at approximately a 45 degree angle to the axis of the breech, a signal plate pivoted at one corner in said slot and having a front edge sloped at approximately a 45° angle to the axis of the breech and adapted to bear against said inclined wall of the slot when the plate is rocked outwardly upon its pivot by



insertion of a cartridge into the breech, a fin on the plate exposed beyond the outer surface of the breech when the plate is moved outwardly by insertion of the cartridge, a spring extending from the sloped front wall of the slot and bearing against the sloped edge of the plate to normally hold the plate projecting into the path of movement of a cartridge being inserted into the breech, and a projection on said fin outside of the breech forming a stop adapted to engage the outer surface of the breech and limiting rocking pivotal movement of the plate under action of the spring.

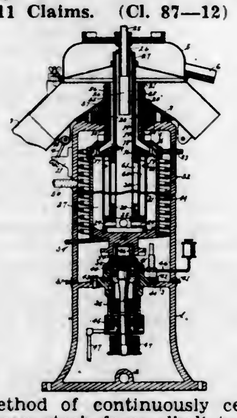
2,100,274
PROCESS FOR REFINING OILS
Benjamin Clayton, Houston, Tex., Walter B. Kerrick, Los Angeles, and Henry M. Stadt, Glendale, Calif., assignors, by direct and mesne assignments, to Refining, Inc., Reno, Nev., a corporation of Nevada
Application May 2, 1931, Serial No. 534,533
40 Claims. (Cl. 87—12)

3. A process for the purification of vegetable and animal oil containing free fatty acid, comprising continuously feeding in measured quantities separate streams of said oil and an alkali to a mixing zone, continuously advancing said oil and alkali while in intimate physical contact through said mixing zone to effect a thorough admixture thereof, in passing the mixture discharging from the mixing zone as a continuously advancing stream restricted in cross section through a continuous elongated passageway, in raising the temperature of the mixture during its passage through said elongated passageway to a degree sufficient to facilitate its subsequent centrifugal separation, and in subjecting the mixture discharging from said passageway to centrifugal separation to separate the refined oil from resulting sludge and residual solution.



2,100,275
PROCESS OF REFINING GLYCERIDE OILS
Benjamin Clayton, Sugarland, Tex., Walter Barnes Kerrick, Los Angeles, and Henry M. Stadt, Glendale, Calif., and Benjamin H. Thurman, Bronxville, N. Y., assignors, by direct and mesne assignments, to Refining, Inc., Reno, Nev., a corporation of Nevada
Application August 14, 1933, Serial No. 685,130
In England March 25, 1933
23 Claims. (Cl. 87—12)

17. In the purification of glyceride oils containing free fatty acid and color impurities, a quick process comprising mixing small quantities of oil and a saponifying reagent for a brief period to form soap stock, heating the oil to a temperature which will cause the resulting mixture to be at an "emulsion breaking or opposing" temperature in excess of 100° F., prior to mixing the same with said saponifying reagent, whereby to rapidly condition the mixture of oil and soap stock for the step of centrifugally separating the soap stock from the oil, providing sufficient time for the soap stock to agglomerate with color impurities after the materials are contacted and during the passage of the mixture to the centrifugal separator and promptly subjecting the mixture to centrifugal separation for the separation of the soap stock and the agglomerated color impurities from the oil.

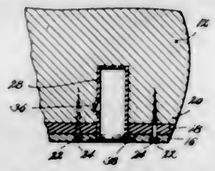


2,100,276
PROCESS OF REFINING GLYCERIDE TYPE OILS
Benjamin Clayton, Houston, Tex., assignor to Refining, Inc., Reno, Nev., a corporation of Nevada
Application July 9, 1935, Serial No. 30,573
Renewed September 20, 1937
13 Claims. (Cl. 87—12)

1. A continuous process of refining glyceride type oil which comprises mixing an alkaline reagent with said oil to effect neutralization of the free fatty acids contained in the oil, continuously advancing the mixture through a zone where the heavier constituents are kept in dispersion in the oil and the remaining caustic acts upon the color to produce a proper bleach, maintaining the temperature of the mixture while passing through said zone to a relatively low degree and maintaining the mixture in said zone for a time sufficiently short to avoid excessive refining losses during the travel of said mixture but relatively long with respect to the time the mixture is later subjected to an elevated temperature, passing the mixture promptly to a centrifuge while

abruptly subjecting it to an elevation of temperature during centrifugal separation.

2,100,277
PROCESS FOR REFINING GLYCERIDE OIL
Benjamin Clayton, Houston, Tex., assignor to Refining, Inc., Reno, Nev., a corporation of Nevada
Application August 1, 1935, Serial No. 34,258. Renewed September 20, 1937. In Canada December 21, 1935
11 Claims. (Cl. 87—12)

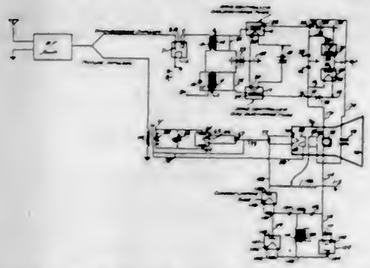


1. The method of continuously centrifugally separating soap stock from alkali treated glyceride oils, which comprises separating the soap stock from said oil by centrifugal force in a rotating centrifugal bowl, and discharging the oil and soap stock separately therefrom, applying heat to the material undergoing separation in an amount sufficient to maintain the temperature of the soap stock being discharged from the centrifugal from 120° F. to at least as high as 160 F., while preventing a substantial increase in the temperature of the oil during separation.

2,100,278
REINFORCED LAST FOR BOOTS AND SHOES
Walter P. Field, Brockton, Mass., assignor to Florence F. Field, Brockton, Mass., doing business as W. & F. F. Field Company
Application July 29, 1936, Serial No. 93,163
6 Claims. (Cl. 12—139)

1. A wooden last for boots or shoes having its comb portion provided with a protective cushion

comprising an outer layer of fibrous non-compressible material and an inner layer of relatively hard yet permanently resilient material, said cushion being fastened to said comb portion by a plurality of drive screws having threaded



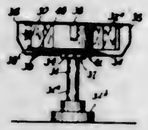
ends embedded in said comb portion and having smooth shank portions within said cushion for permitting compression of said cushion without disturbing the fastening of said screws in said comb.

2,100,279

TELEVISION SYSTEM

Roscoe H. George and Howard J. Heim, La Fayette, Ind., assignors, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware

Application September 2, 1931, Serial No. 560,798
14 Claims. (Cl. 178—7.5)



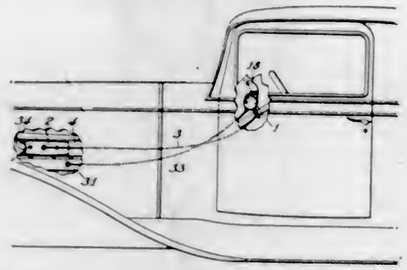
1. In a television receiver adapted to have impressed thereon two series of synchronizing impulses, scanning means comprising two transformers, the primaries thereof being in series with each other, means for rendering one of said transformers responsive to both series of synchronizing impulses, means for rendering the other transformer responsive to only one series of synchronizing impulses, damping means associated with each of said transformer secondaries and means including a grid controlled gaseous discharge device associated with each of said transformer secondaries for utilizing said synchronizing impulses for scanning purposes.

2,100,280

ROTARY GAME TABLE

Oscar Goldberger, New York, N. Y., assignor to Rotor-Table Games, Inc., New York, N. Y.

Application April 16, 1935, Serial No. 16,547
3 Claims. (Cl. 273—136)



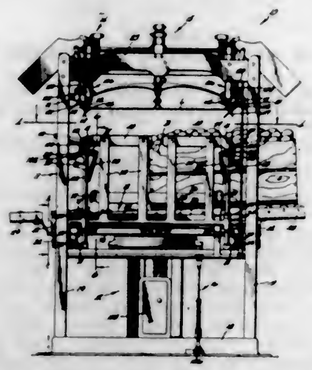
1. In a rotary game table, a table top, a game device rotatably mounted beneath said table top, a fixedly mounted plate with an edge portion having peripheral apertures, means on said game device for engaging said apertures to hold said game device in fixed positions, and several strips of material having one of their ends attached to the underside of said plate and extending upward and supporting said table top.

2,100,281

MOTOR VEHICLE TEMPERATURE MODIFIER

Henry Hueber, Buffalo, and Erwin C. Horton, Hamburg, N. Y., assignors to Trico Products Corporation, Buffalo, N. Y.

Application May 29, 1933, Serial No. 673,552
20 Claims. (Cl. 237—12.3)



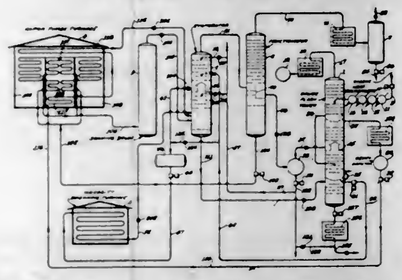
3. A temperature regulating unit for motor vehicles comprising a pair of complemental casing sections forming a pump chamber, one casing section carrying a radiator and the second casing section carrying a motor, pump means within the pump chamber and operable by said motor for creating a flow of air over the radiator, and means for securing the casing sections together, said pump means being enclosed by said complemental sections and said pump chamber separating said motor from said radiator.

2,100,282

TUCKING MECHANISM

Dana E. Keech, Glendale, Calif., assignor, by mesne assignments, to Food Machinery Corporation, a corporation of Delaware

Application February 12, 1934, Serial No. 710,845
22 Claims. (Cl. 1—10)



1. In a machine for pressing covers on overfilled boxes the combination of: cover pressing mechanism; a stop for stopping a box in place in said machine; means for moving overflow portions of the contents of said box inward; and means for actuating said overflow moving means in response to said stop being engaged by a box.

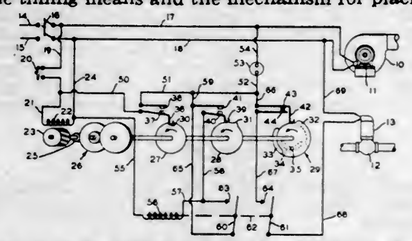
2,100,283

PROCESS OF TREATING HYDROCARBON OIL

Percival C. Keith, Jr., Port Washington, N. Y., assignor to Gasoline Products Company, Inc., Newark, N. J., a corporation of Delaware

Application June 16, 1933, Serial No. 676,127
11 Claims. (Cl. 196—48)

1. The process of treating hydrocarbon oil which comprises introducing relatively heavy oil comprising residual constituents and lighter constituents into a stripping zone wherein said oil is separated into vapors and a liquid residue, removing said residue from said stripping zone and passing residue so removed through a first cracking zone wherein it is raised to a cracking temperature and subjected to conversion while passing in a stream of restricted cross-sectional area through a heating zone, introducing the resulting cracked products into an evaporating zone wherein vapors separate from liquid residue, fractionating vapors evolved from said oil in said stripping zone to form a condensate suitable for use as clean cracking stock, passing condensate so derived through a second cracking zone wherein it is raised to a cracking temperature and subjected to conversion while passing in a stream of restricted cross-sectional area through a heating zone, introducing the resulting cracked products into said evaporating zone to be in admixture therein with the products from said first-mentioned cracking zone, removing liquid residue from said evaporating zone, reducing the pressure on the residue so removed to cause partial vaporization thereof, passing resulting vapors upwardly through said stripping zone to aid in heating and distilling the said heavy oil introduced thereinto, while preventing the mixture with the stock passing through said first and second cracking zones of undistilled portions of said residue last-mentioned, and fractionating vapors separated in said evaporating zone to form a final desired light product.



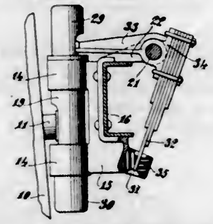
2,100,284

TIME CONTROL SYSTEM

John P. Kriechbaum, Minneapolis, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware

Application November 16, 1934, Serial No. 753,314
21 Claims. (Cl. 34—19)

1. In a system of the character described, a device to be operated following the lapse of a substantial time interval, timing means, mechanism placed in operation by the timing means to start a timing cycle, and means controlled by the timing means and the mechanism for placing



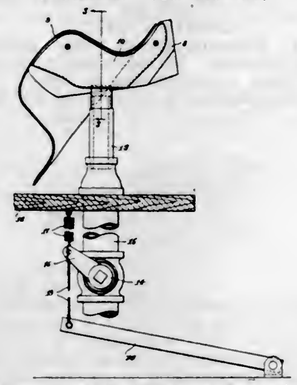
the device in operation a substantial time after the starting of the timing cycle.

2,100,285

INDEPENDENTLY SPRUNG FRONT WHEEL

Philip E. Matthews, Plainfield, N. J., assignor to Mack Manufacturing Corporation, a corporation of Delaware

Application December 12, 1934, Serial No. 757,089
6 Claims. (Cl. 267—57)



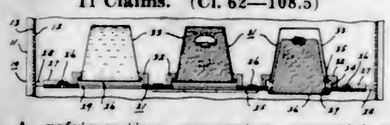
1. An independent wheel mounting comprising a vehicle frame, means to mount a wheel on the frame with provision for vertical movement thereof with respect to the frame, an arm movable with respect to the frame, a torsion spring anchored to the arm, yielding non-metallic means to secure the spring to the frame, and a thrust bearing on the end of the arm engaging the wheel mounting means.

2,100,286

CLEANING METHOD AND APPARATUS

George W. Allen, Hyde Park, Boston, and Joseph S. Farwell, Brookline, Mass., assignors to B. F. Sturtevant Company, Inc., Hyde Park, Boston, Mass.

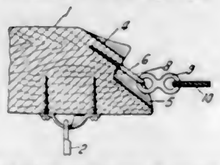
Application October 26, 1934, Serial No. 750,178
4 Claims. (Cl. 223—23)



1. The method of cleaning a hat which comprises rotating the hat, sweeping during one com-

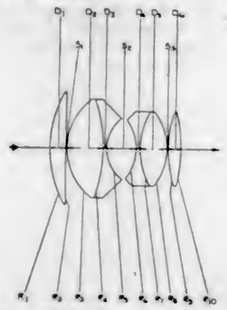
plete revolution of the hat, the entire underside of both the crown and brim of the hat with a concentrated suction force in a narrow band applied simultaneously to said crown and brim, and preventing deformation of the hat during the cleaning thereof by supporting during said rotation a substantial portion of the crown and brim of said hat adjacent said band of suction.

2,100,287
MOTOR FUEL
Victor Conquest, Chicago, Ill., assignor to Armour and Company, Chicago, Ill., a corporation of Illinois
No Drawing. Application June 29, 1936, Serial No. 88,064
4 Claims. (Cl. 44—9)



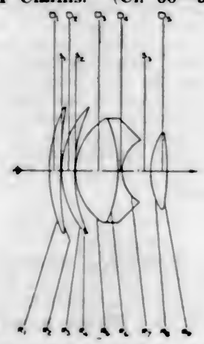
1. A hydrocarbon motor fuel of the gasoline or kerosene type, said fuel containing a small amount of an aralkyl ketone the aryl radical of which is chosen from the group consisting of unsubstituted phenyl, tolyl and xylyl, and the alkyl group is a straight-chain unsubstituted alkyl radical containing at least eight carbon atoms.

2,100,288
REFRIGERATING APPARATUS
Elmer L. Horlacher, Dayton, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware
Application June 27, 1936, Serial No. 87,756
11 Claims. (Cl. 62—108.5)



1. A refrigerating apparatus comprising in combination, a cooling element, a support on said cooling element, a device supported on said support and provided with a mold having an open bottom and adapted to contain a liquid to be frozen, means for closing the open bottom of said mold to seal a liquid therein, said support having an opening beneath the bottom of said mold, said closure means being movable relative to said mold through the opening in said support, and the liquid within said mold upon freezing and expanding therein being released therefrom and moving said closure means to thereby fall through the opening in said support.

2,100,289
CASTING BAIT
Herman F. Khoenle, Akron, Ohio, assignor to The Enterprise Manufacturing Company, Akron, Ohio, a corporation of Ohio
Application March 24, 1936, Serial No. 70,626
6 Claims. (Cl. 43—46)

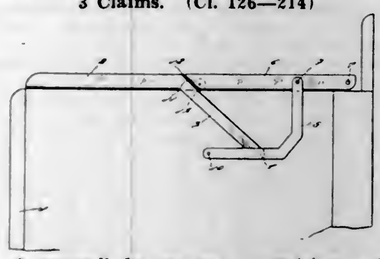


1. An artificial bait for use in trolling or "popping" comprising a bait body the forward end of which is formed with a plurality of downwardly and forwardly inclined surfaces, separated by an undercut notch extending across the end of the bait, the said surfaces being concaved transversely of the body.

2,100,290
LENS
Horace William Lee, Chiswick, England, assignor to Kapella Limited, Leicester, England, a corporation of England
Application June 8, 1935, Serial No. 25,563. Renewed May 6, 1937. In Great Britain June 15, 1934
4 Claims. (Cl. 88—57)

1. A lens comprising four separate components of which the two exterior ones are collective and the two interior ones are dispersive menisci and have their concave exterior surfaces facing one another, the outer convex surfaces having radii of curvature at their vertices not less than 0.45 the focal length of the system, the front dispersive component having its exterior concave surface of radius of curvature not less than one-fourth and the rear dispersive component having its exterior concave surface of radius not less than one-third, the focal length of the system, and in which at least one of the exterior surfaces of the components is substantially conicoidal as to its peripheral zone over a width not less than one-tenth the diameter of the surface at any point in its periphery.

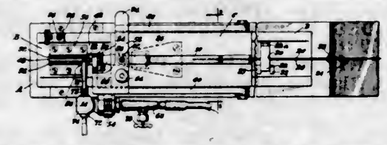
2,100,291
LENS
Horace William Lee, Leicester, England, assignor to Kapella Limited, Leicester, England, a corporation of England
Application July 18, 1935, Serial No. 32,047
In Great Britain July 18, 1934
4 Claims. (Cl. 88—57)



1. A substantially corrected photographic lens comprising in order from the front to the rear a meniscus type collective member with the convex surface towards the incident light, a compound dispersive member including a front collective element and a rear dispersive element and a collective member, said dispersive member having a convex face towards the incident light, and a concave face on the opposite side, all of said members being air-spaced in axial alignment, the power of the collective members being greater than that of the dispersive member to make the lens system as a whole collective, the marginal part of one glass-air surface of one member having a curvature substantially that of one of the conic sections and of a magnitude such that the member having this non-spherical surface contains less glass than it would have if such surface had the same curvature throughout as it had at the axis of the lens to reduce zonal spherical aberration.

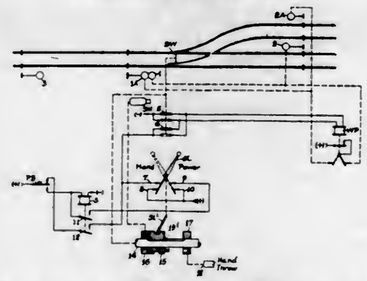
2,100,292
BURNER FORMING GRID
Frank H. Schneider, Royersford, Pa., assignor to The Floyd-Wells Company, Royersford, Pa., a corporation of Pennsylvania
Application July 17, 1936, Serial No. 91,043
3 Claims. (Cl. 126—39)

1. A burner in the form of an integral casting having at its outer portion an endless fuel passage with combined grid and burner members projecting inwardly from and communicating with said passage, and terminating in proximity to the central portion of the burner, said members forming the utensil supporting means and having burner ports at opposite sides.



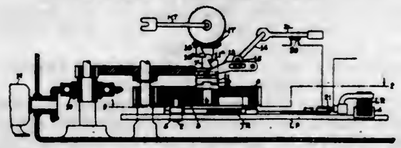
2,100,293
COVERALL FOR RANGES
Walter D. Teague, Jr., Kew Gardens, N. Y., assignor to The Floyd-Wells Company, Royersford, Pa., a corporation of Pennsylvania
Application December 10, 1936, Serial No. 115,158
3 Claims. (Cl. 126—214)

1. A coverall for ranges, comprising a front cover section having a fixed pivot, a rear cover section having a fixed pivot, and means connecting said covers to cause them to move in unison and into alignment in closed position and to position the front cover section in front of the rear cover section when the coverall is in raised position.



2,100,294
METHOD AND MACHINE FOR PRODUCING BRAZED SEAMS IN WIRE CLOTH
Nelson W. Webb, Belleville, N. J., assignor to Eastwood-Nealy Corporation, Belleville, N. J., a corporation of New Jersey
Application June 13, 1935, Serial No. 26,446
Renewed May 5, 1937
28 Claims. (Cl. 113—59)

1. A portable brazing machine for brazing wire-cloth edges comprising in combination a base part, an upper part on the base part, said upper part and said base part slidably receiving between them the thickness of the wire-cloth, the base part having a bottom suitable for supporting the machine upright for free movement in any direction on a table, a cloth-edge guide extending lengthwise of the machine at the division between



its base part and upper part, means for translating said base and upper parts as a unit along a supporting table and slidingly across the interposed cloth-ends whose edges project toward each other against the sides of the cloth-edge guide, and brazing means carried by the machine operative on the edges of the cloth beyond one end of the guide.

2,100,295
SIGNALING SYSTEM FOR RAILROADS
Sedgwick N. Wight, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.
Application July 14, 1934, Serial No. 735,267
8 Claims. (Cl. 246—220)

1. In a signaling system for railroads, a track switch, a switch machine, dual control means conditioning the switch to be moved and locked by power or by hand, signals governing traffic over the switch, and manually operable means at the switch operable for clearing of the signals while said switch machine is in condition for hand operation due to the position of the dual control means.

2,100,296
SWITCH MACHINE FOR RAILROADS
Sedgwick N. Wight, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.
Application January 19, 1935, Serial No. 2,563
9 Claims. (Cl. 246—240)

1. In a power operated switch machine having a throw rod and a locking plunger which are operated in succession by the rotation of a main shaft to different extents, manually operable

means for rotating said shaft to one extent, another manually operable means for rotating said shaft to a different extent, for operating either the throw rod alone or both the throw rod and locking plunger.

2,100,297

SOLUBILIZED HIGHER ALIPHATIC SULPHIDES AND PROCESS FOR THEIR PRODUCTION

Alfred William Baldwin and Henry Alfred Piggott, Blackley, Manchester, England, assignors to Imperial Chemical Industries Limited, a corporation of Great Britain

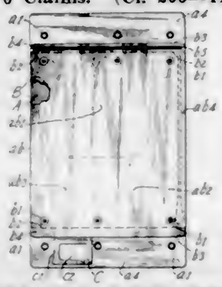
No Drawing. Application February 27, 1935, Serial No. 8,553. In Great Britain March 12, 1934

14 Claims. (Cl. 260—99.12)

3. The process of making compounds having the general formula

$$A—S—R(SO_4M)_{1 \text{ or } 2}$$

in which A represents an alkyl group having a chain containing eight or more carbon atoms, R represents an aliphatic hydrocarbon group, and M represents hydrogen or an alkali metal, which comprises sulphating compounds having the general formula $A—S—R(OH)_{1 \text{ or } 2}$.



2,100,298

POUCH

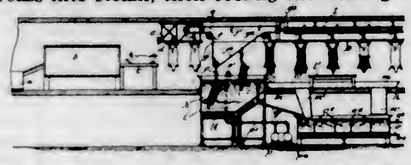
William Edwards Baxter, Floyd County, Ind.

Application July 30, 1935, Serial No. 33,877

6 Claims. (Cl. 206—41)

1. A pouch having a backing member, a second member of shorter length than said backing member positioned on and secured to said backing member in such a manner that an end of said backing member projects, forming a flap, an end of said second member near said flap being turned over to form a sheath along an edge thereof and a stiffening member in said sheath, whereby when said flap is turned over to close the pouch said stiffening member aids in preventing leakage of the contents.

2,100,299



TREATMENT OF HOG CARCASSES

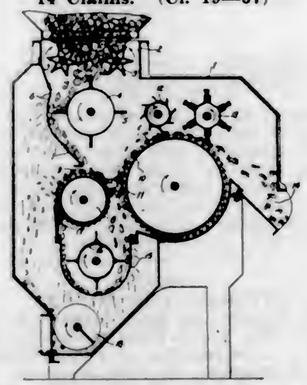
Frederick M. Tobin, Rochester, N. Y., assignor to The Tobin Packing Co., Inc., Fort Dodge, Iowa, a corporation of Iowa

Application May 6, 1937, Serial No. 141,031

8 Claims. (Cl. 17—45)

1. That improvement in the treatment of a hog carcass which comprises first applying an appreciable amount of moisture to the carcass, then substantially immediately thereafter dipping the moistened carcass in a molten, readily congealable, adhesive liquid for a sufficient length of time to form a substantially complete seal-like coating therearound and at a sufficient temperature to change the moisture on and in the skin of the carcass into steam, then cooling the coating to a

plastic state, and finally removing the plastic coating from the carcass so as to release the matter loosened from the skin by the steam and also remove the hair embedded in the coating.



2,100,300

COTTON CLEANING AND RECLAIMING MACHINE

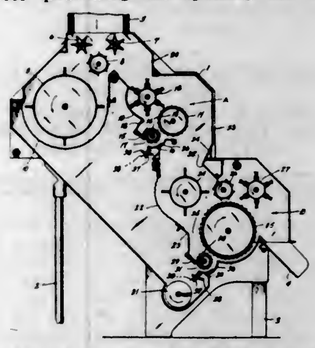
John E. Mitchell, Dallas, Tex.

Application May 14, 1936, Serial No. 79,647

14 Claims. (Cl. 19—37)

1. A cotton cleaning machine comprising, in combination, a rotatable extracting saw cylinder for receiving mixed cotton and hulls fed into the machine, a reclaiming saw cylinder for recovering any cotton escaping with hulls past the extracting cylinder and mounted to rotate in the same direction as the extracting cylinder at a distance therefrom, and means for projecting a stream of the mixed cotton and hulls over and in contact with one side of the reclaiming saw cylinder and toward the extracting cylinder to thereby doff any recovered cotton from the reclaiming cylinder and deliver it, along with the mixed cotton and hulls, to the extracting cylinder.

2,100,301



SELF-CONTAINED BOLL COTTON EXTRACTING MACHINE

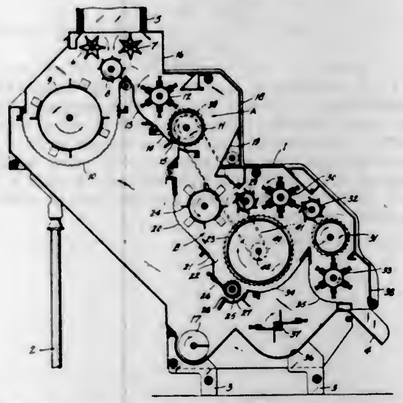
John E. Mitchell, Dallas, Tex.

Application May 18, 1936, Serial No. 80,239

12 Claims. (Cl. 19—35)

1. In a multi-unit extracting machine for making a plurality of separations of hulls and hull particles from a regulated stream of mixed cotton and hulls fed into the machine, an upper extracting unit having an extracting cylinder and providing an opening of a size to permit the free escape past the cylinder of a portion of the hulls and of lock cotton not engaged by the same, the remaining cotton and hulls being carried up by the extracting cylinder and delivered to a lower unit, a reclaiming cylinder co-operating with said extracting cylinder and functioning to recover cotton locks from the hulls escaping past the extracting cylinder and to discharge the hulls from the machine, a lower extracting unit receiving the cotton and remaining hulls removed from the stream in the first unit by the extracting cylinder thereof, an extracting cylinder in said lower unit, the latter providing an opening for the free

escape past its cylinder of hulls and lock cotton not engaged thereby, a separate reclaiming cylinder co-operating with the lower extracting cylinder to recover cotton locks from the remaining hulls escaping past said latter extracting cylinder, and means for delivering the cotton and hulls entering the lower unit from the upper unit to the rising side of the lower extracting cylinder.



2,100,302

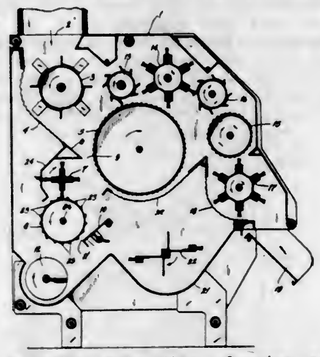
SELF-CONTAINED BOLL COTTON EXTRACTING MACHINE

John E. Mitchell, Dallas, Tex.

Application May 18, 1936, Serial No. 80,240

11 Claims. (Cl. 19—35)

5. In a multi-unit cotton extracting machine, an upper unit having an extracting cylinder and co-operating hull-discharge means for effecting the escape from the unit and the discharge from the machine of free hulls from a mixture of cotton and hulls fed into the unit, and the delivery of the cotton and remaining hulls to a lower unit, an extracting cylinder in said lower unit, a kicker roll co-operating with the latter extracting cylinder, and a reclaiming cylinder for recovering locks of cotton escaping with the hulls past the lifting side of said latter extracting cylinder.



2,100,303

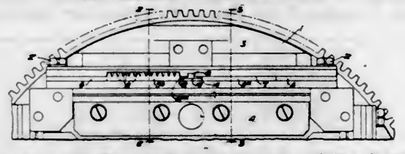
COTTON CLEANING AND RECLAIMING MACHINE

John E. Mitchell, Dallas, Tex.

Application May 18, 1936, Serial No. 80,241

12 Claims. (Cl. 19—37)

1. In a cotton extracting, cleaning and reclaiming machine, in combination with an extracting cylinder adapted to receive a mixed stream of cotton and hulls directed against its rising side and having a kicker roll cooperating therewith, a reclaiming cylinder rotating in an opposite direction to the extracting cylinder for recovering cotton from cotton and hulls escaping past the latter, positioned to receive said escaping cotton and hulls on its rising side and provided with a hull board facing its rising side, the lower edge of which defines, with the side of the reclaiming cylinder the size of a space past the latter for the escape of hulls, and the top of said hull board being positioned at such distance from the reclaiming cylinder as to prevent cotton from being thrown over it by the reclaiming cylinder, but being close enough to said cylinder to permit the teeth thereof by impact to throw over said top hulls, flared bolls, and the like, that are too large to escape through the space past the lower edge of the hull board.



2,100,304

TYPOGRAPHICAL MOLD AND SLUG

Edward M. Righter, Lincoln, Nebr., assignor to Intertype Corporation, Brooklyn, N. Y., a corporation of New York

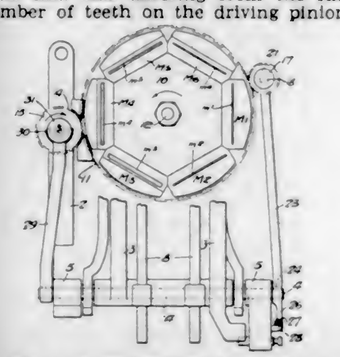
Application June 5, 1937, Serial No. 146,665

25 Claims. (Cl. 199—57)

1. A mold for a slug casting machine having non-adjacent longitudinal casting slots of different heights and a communicating passage between the slots of less height than either of said slots.

2,100,305

TYPOGRAPHICAL MACHINE



Samuel E. Sperry, Hollis, N. Y., assignor to Intertype Corporation, Brooklyn, N. Y., a corporation of New York

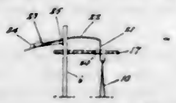
Application October 21, 1936, Serial No. 106,910

8 Claims. (Cl. 271—48)

1. In a typographical machine having a toothed rotatable mold disk carrying a plurality

of slug casting molds and a driving pinion movable into and out of mesh with said disk and cooperative with said disk when in mesh therewith for rotating it to bring a mold in position thereon for use into slug casting and ejecting positions, a mold selecting pinion having a number of teeth thereon of a ratio to the number of teeth on said disk differing from the ratio of the number of teeth on the driving pinion and

on the disk and corresponding with the number of molds on the disk, said mold selecting pinion being normally disengaged from the disk but movable into engagement therewith to rotate said disk and thereby bring another mold thereon into position for use, and means operative upon such engagement of the mold selecting pinion with the disk to disengage the driving pinion therefrom.



2,100,306

FILAMENT SUPPORT FOR RADIO TUBES AND THE LIKE

Henry J. McCarthy, Danvers, Mass., assignor to Hygrade Sylvania Corporation, Salem, Mass., a corporation of Massachusetts

Application September 28, 1936, Serial No. 102,872

14 Claims. (Cl. 250—27.5)

1. A resilient support for a filament comprising a spring member having a hook portion to engage a filament bight and a shank portion, and a support for the spring member said support including a frame-like member having a pair of spaced arms and mounted so that part of the length of the shank engages the upper face of one arm of the frame-like member and another part of the length engages the lower face of the other arm of the frame-like member, the points of engagement between said shank and said arms being at different parts of said shank.

2,100,307

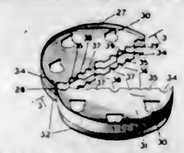
HOLLOW METAL SHAFT AND MANUFACTURE OF SAME

Wiley W. McMinn, Orange, N. J.

Application February 20, 1936, Serial No. 64,816

11 Claims. (Cl. 29—156)

1. The method of making a hollow metal shaft structure which consists in winding a strip of metal of substantially uniform width and thickness into a series of contiguous spiral convolutions having a continuous spiral seam therebetween, sealing said seam to produce an integral tubular spiral wound blank and thereafter reducing the diameter of said blank along certain portions thereof to provide a finished shaft structure having different wall thicknesses at different places longitudinally of its length.



2,100,308

ELECTRON DISCHARGE DEVICE

Carl F. Miller, Emporium, Pa., assignor to Hygrade Sylvania Corporation, Salem, Mass., a corporation of Massachusetts

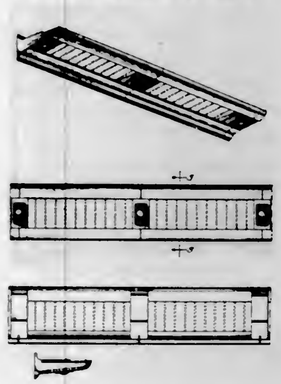
Application November 2, 1935, Serial No. 47,922

11 Claims. (Cl. 250—27.5)

11. A combined spacer-shield for radio tubes comprising a cup-like metal member formed with two separable halves, an insulator member formed with two separable halves and seated within said cup-like member, and another insulator member formed with two separable halves, all said members being provided with aligned sets of notches in their opposed edges.

DESIGNS

NOVEMBER 23, 1937



107,062

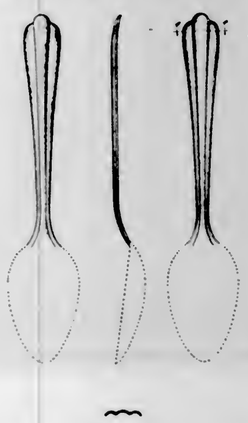
DESIGN FOR A COMBINED SECTIONAL LUGGAGE RACK AND LIGHTING FIXTURE UNITS

Albert L. Arenberg, Highland Park, Ill., assignor to Patent License Corporation, Chicago, Ill., a corporation of Illinois

Application February 13, 1937, Serial No. 67,632

Term of patent 14 years

The ornamental design for a combined sectional luggage rack and lighting fixture units, substantially as shown.



107,063

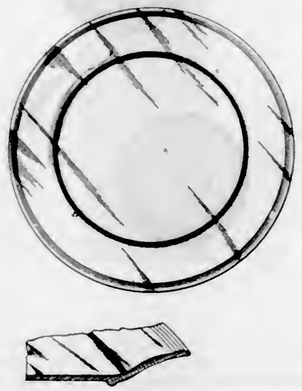
DESIGN FOR A SPOON OR OTHER SIMILAR ARTICLE

Milton Bernstein, Brooklyn, N. Y., assignor to National Silver Company, New York, N. Y.

Application July 22, 1937, Serial No. 70,580

Term of patent 7 years

The ornamental design for a spoon or other similar article as shown and described.



107,064

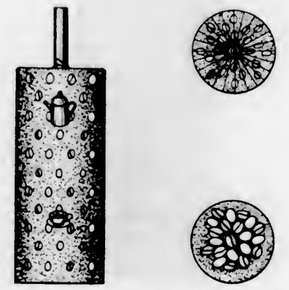
DESIGN FOR A PLATE OR SIMILAR ARTICLE

Vincent Broomhall, East Liverpool, Ohio, assignor to The Edwin M. Knowles China Company, East Liverpool, Ohio, a corporation of West Virginia

Application October 4, 1937, Serial No. 71,955

Term of patent 3½ years

The ornamental design for a plate or similar article as shown.



107,065

DESIGN FOR A COFFEE BAG OR SIMILAR ARTICLE

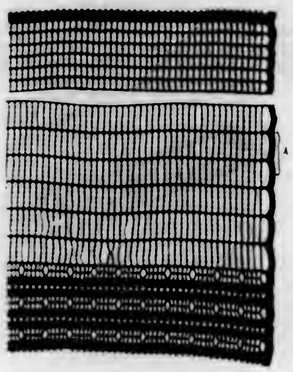
Ernest Carabillo, Brooklyn, N. Y.

Application August 14, 1937, Serial No. 71,078

Term of patent 7 years

The ornamental design for a coffee bag or similar article, substantially as shown and described.

107,066
DESIGN FOR A GOLF BALL OR THE LIKE
Frank H. Cavignac, New York, N. Y., assignor to Mervin P. Doughty, Lawrence, N. Y.
Application April 5, 1937, Serial No. 68,571
Term of patent 14 years

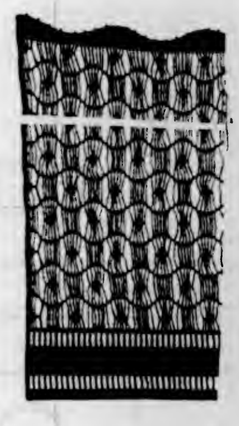


The ornamental design for a golf ball or the like as shown.

107,067
DESIGN FOR A GOBLET OR SIMILAR ARTICLE
Andrew J. Cunningham, Snyder, N. Y.
Application June 30, 1937, Serial No. 70,147
Term of patent 7 years

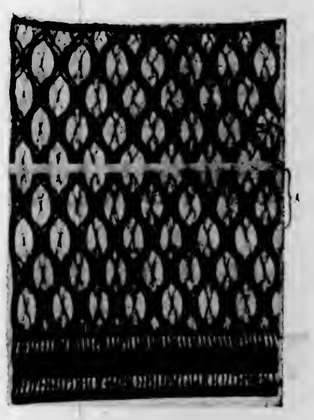
The ornamental design for a goblet or similar article as shown.

107,068
DESIGN FOR A CURTAIN
Gustave F. Erhard, Scranton, Pa., assignor to The Scranton Lace Company, Scranton, Pa., a corporation of Pennsylvania
Application October 15, 1937, Serial No. 72,188
Term of patent 3½ years



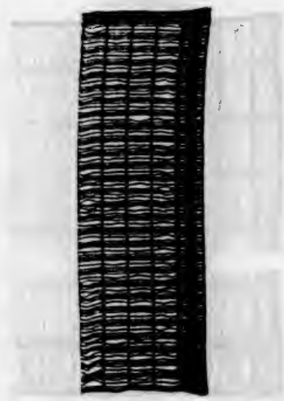
The ornamental design for a curtain substantially as shown and described.

107,069
DESIGN FOR A CURTAIN
Gustave F. Erhard, Scranton, Pa., assignor to The Scranton Lace Company, Scranton, Pa., a corporation of Pennsylvania
Application October 15, 1937, Serial No. 72,189
Term of patent 3½ years



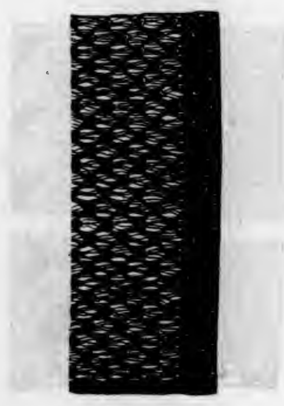
The ornamental design for a curtain substantially as shown and described.

107,070
DESIGN FOR A CURTAIN
Gustave F. Erhard, Scranton, Pa., assignor to The Scranton Lace Company, Scranton, Pa., a corporation of Pennsylvania
Application October 15, 1937, Serial No. 72,190
Term of patent 3½ years



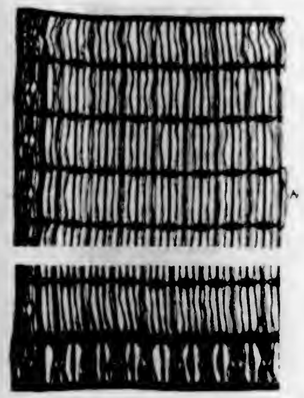
The ornamental design for a curtain substantially as shown and described.

107,071
DESIGN FOR A CURTAIN
Gustave F. Erhard, Scranton, Pa., assignor to The Scranton Lace Company, Scranton, Pa., a corporation of Pennsylvania
Application October 15, 1937, Serial No. 72,191
Term of patent 3½ years



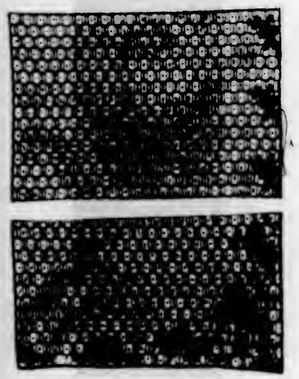
The ornamental design for a curtain substantially as shown and described.

107,072
DESIGN FOR A CURTAIN
Gustave F. Erhard, Scranton, Pa., assignor to The Scranton Lace Company, Scranton, Pa., a corporation of Pennsylvania
Application October 15, 1937, Serial No. 72,192
Term of patent 3½ years



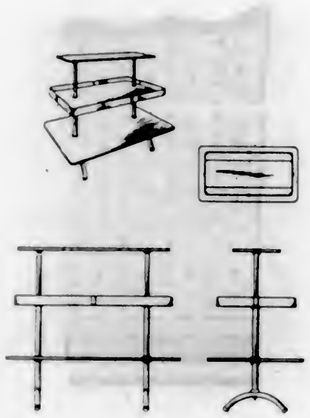
The ornamental design for a curtain substantially as shown and described.

107,073
DESIGN FOR A CURTAIN
Gustave F. Erhard, Scranton, Pa., assignor to The Scranton Lace Company, Scranton, Pa., a corporation of Pennsylvania
Application October 15, 1937, Serial No. 72,193
Term of patent 3½ years



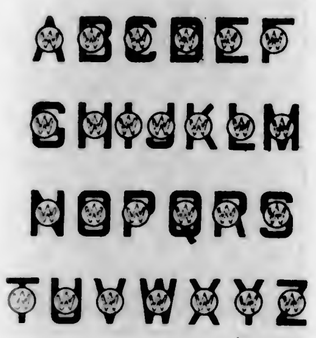
The ornamental design for a curtain substantially as shown and described.

107,074
DESIGN FOR A CURTAIN
Gustave F. Erhard, Scranton, Pa., assignor to The Scranton Lace Company, Scranton, Pa., a corporation of Pennsylvania
Application October 15, 1937, Serial No. 72,194
Term of patent 3½ years



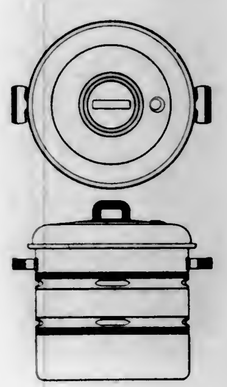
The ornamental design for a curtain substantially as shown and described.

107,075
DESIGN FOR A CURTAIN
Gustave F. Erhard, Scranton, Pa., assignor to The Scranton Lace Company, Scranton, Pa., a corporation of Pennsylvania
Application October 15, 1937, Serial No. 72,195
Term of patent 3½ years



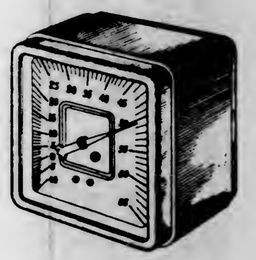
The ornamental design for a curtain substantially as shown and described.

107,076
DESIGN FOR A DISPLAY RACK FOR BREAD OR SIMILAR ARTICLE
Ernest R. Erickson, Des Moines, Iowa, assignor to C. E. Erickson Company, Incorporated, Des Moines, Iowa, a corporation of Iowa
Application September 8, 1936, Serial No. 64,754
Term of patent 7 years



The ornamental design for a display rack for bread or similar article substantially as shown.

107,077
DESIGN FOR A FONT OF TYPE
Helen Converse Gatchell and William C. Hollister, Chicago, Ill.
Application November 12, 1936, Serial No. 65,868
Term of patent 7 years

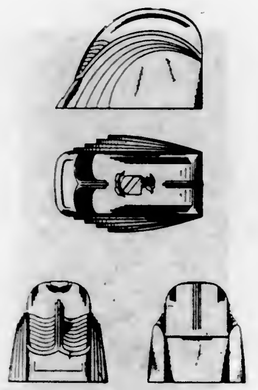


The ornamental design for a font of type as shown and described.

107,078
DESIGN FOR A COOKING POT OR SIMILAR ARTICLE
Lurelle Guild, Noroton, Conn.
Application September 4, 1937, Serial No. 71,476
Term of patent 3½ years

The ornamental design for a cooking pot or similar article as shown.

107,079
DESIGN FOR A TEMPERATURE INDICATOR OR SIMILAR ARTICLE
Reynold T. Hedfield and Hans Seegers, Chicago, Ill., assignors to Jas. P. Marsh Corporation, Chicago, Ill., a corporation of Illinois
Application August 30, 1937, Serial No. 71,390
Term of patent 14 years



The ornamental design for a temperature indicator or similar article substantially as shown, and described.

107,080
DESIGN FOR A LAMP BASE
Curtis B. Ilgenfritz, York, Pa.
Application July 28, 1937, Serial No. 70,703
Term of patent 7 years

The ornamental design for a lamp base as shown and described.

107,081
DESIGN FOR A JEWELRY BOX
Irwin H. Jellinek, Buffalo, N. Y., assignor to Buffalo Jewelry Case Co. Inc., Buffalo, N. Y., a corporation of New York
Application October 7, 1937, Serial No. 72,035
Term of patent 3½ years

The ornamental design for a jewelry box, substantially as shown.

107,082
DESIGN FOR A JAR
William E. Mackelfresh, Jr., Chicago, Ill., assignor to Owens-Illinois Glass Company, Toledo, Ohio, a corporation of Ohio
Application September 22, 1937, Serial No. 71,723
Term of patent 14 years

The ornamental design for a jar substantially as shown and described.

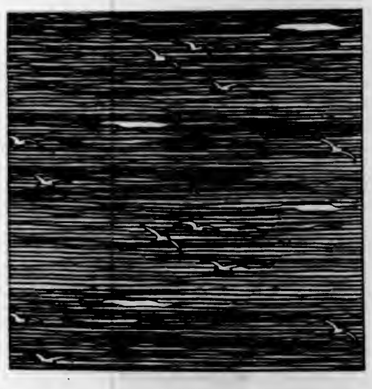
107,083
DESIGN FOR A RUG
George E. Mallinson, Amityville, N. Y.
Application October 15, 1937, Serial No. 72,196
Term of patent 3½ years

The ornamental design for a rug substantially as shown.

107,084
DESIGN FOR A RUG
George E. Mallinson, Amityville, N. Y.
Application October 15, 1937, Serial No. 72,197
Term of patent 3½ years

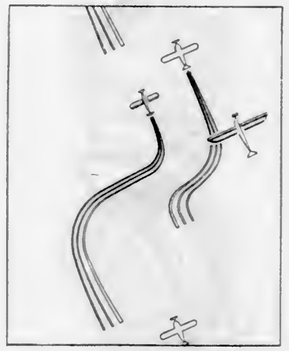
The ornamental design for a rug substantially as shown.

107,085
DESIGN FOR A RUG
George E. Mallinson, Amityville, N. Y.
Application October 15, 1937, Serial No. 72,198
Term of patent 3½ years



The ornamental design for a rug substantially as shown.

107,086
DESIGN FOR A KNITTED FABRIC
Jack Minoff, Newark, N. J.
Application October 11, 1937, Serial No. 72,118
Term of patent 14 years

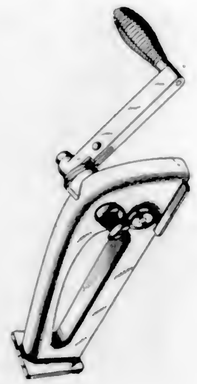


The ornamental design for a knitted fabric substantially as shown.

107,087
DESIGN FOR WALLPAPER OR SIMILAR ARTICLE
John R. Morgan, Oak Park, Ill., assignor to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York
Application October 8, 1937, Serial No. 72,067
Term of patent 7 years

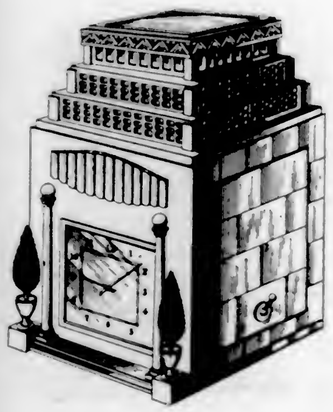
The ornamental design for wallpaper or similar article, as shown.

107,088
DESIGN FOR WALLPAPER OR SIMILAR ARTICLE
John R. Morgan, Oak Park, Ill., assignor to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York
Application October 8, 1937, Serial No. 72,068
Term of patent 7 years



The ornamental design for wallpaper or similar article, as shown.

107,089
DESIGN FOR WALLPAPER OR SIMILAR ARTICLE
John R. Morgan, Oak Park, Ill., assignor to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York
Application October 8, 1937, Serial No. 72,069
Term of patent 7 years



The ornamental design for wallpaper or similar article, as shown.

107,090
DESIGN FOR A CAN OPENER
John R. Morgan, Oak Park, Ill., assignor to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York
Application October 8, 1937, Serial No. 72,070
Term of patent 7 years

The ornamental design for a can opener, as shown.

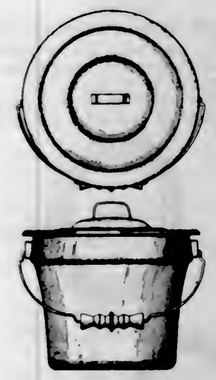
107,091
DESIGN FOR A CLOCK
James J. Paris, George J. Paris, and Andrew J. Paris, Detroit, Mich.
Application September 25, 1936, Serial No. 65,014
Term of patent 14 years

The ornamental design for a clock, as shown and described.

107,092
DESIGN FOR A COMBINED BEVERAGE COOLING AND DISPENSING CABINET
Harry W. Ribble, Niles Center, Ill., assignor, by mesne assignments, to Rapids Equipment Co. Inc., Cedar Rapids, Iowa, a corporation of Iowa
Application July 10, 1937, Serial No. 70,359
Term of patent 14 years

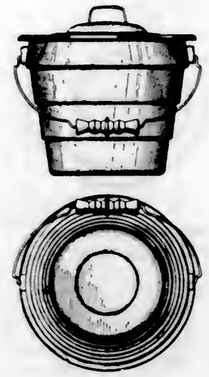
The ornamental design for a combined beverage cooling and dispensing cabinet, as shown and described.

107,093
DESIGN FOR A COMBINET
John Gordon Rideout, Cleveland, Ohio, assignor to Columbian Enameling & Stamping Co., Inc., Terre Haute, Ind., a corporation of Indiana
Application June 30, 1937, Serial No. 70,176
Term of patent 7 years



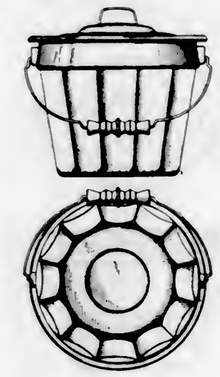
The ornamental design for a combinet, as shown.

107,094
DESIGN FOR A COMBINET
John Gordon Rideout, Cleveland, Ohio, assignor to Columbian Enameling & Stamping Co., Inc., Terre Haute, Ind., a corporation of Indiana
Application June 30, 1937, Serial No. 70,178
Term of patent 7 years



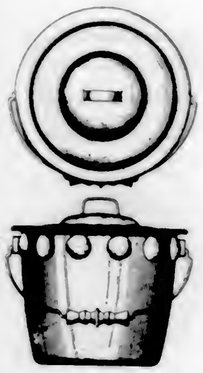
The ornamental design for a combinet as shown.

107,095
DESIGN FOR A COMBINET
John Gordon Rideout, Cleveland, Ohio, assignor to Columbian Enameling & Stamping Co., Inc., Terre Haute, Ind., a corporation of Indiana
Application June 30, 1937, Serial No. 70,179
Term of patent 7 years



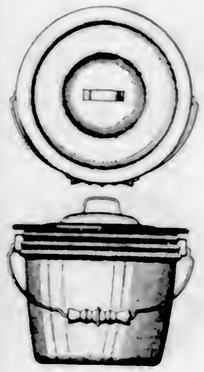
The ornamental design for a combinet, as shown.

107,096
DESIGN FOR A COMBINET
John Gordon Rideout, Cleveland, Ohio, assignor to Columbian Enameling & Stamping Co., Inc., Terre Haute, Ind., a corporation of Indiana
Application June 30, 1937, Serial No. 70,180
Term of patent 7 years



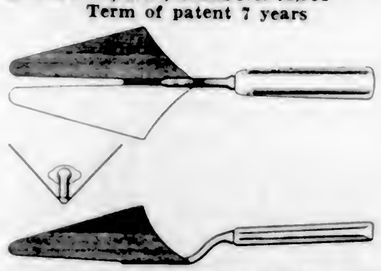
The ornamental design for a combinet, as shown.

107,097
DESIGN FOR A COMBINET
John Gordon Rideout, Cleveland, Ohio, assignor to Columbian Enameling & Stamping Co., Inc., Terre Haute, Ind., a corporation of Indiana
Application June 30, 1937, Serial No. 70,181
Term of patent 7 years



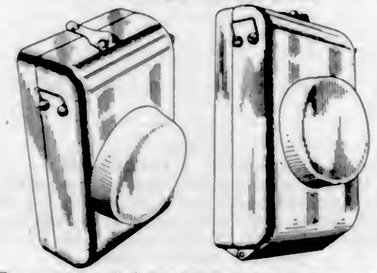
The ornamental design for a combinet, as shown.

107,098
DESIGN FOR A COMBINET
John Gordon Rideout, Cleveland, Ohio, assignor to Columbian Enameling & Stamping Co., Inc., Terre Haute, Ind., a corporation of Indiana
Application July 22, 1937, Serial No. 70,579
Term of patent 7 years



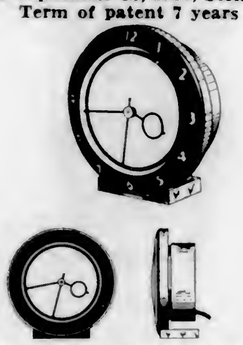
The ornamental design for a combinet, as shown.

107,099
DESIGN FOR A COMBINET
John Gordon Rideout, Cleveland, Ohio, assignor to Columbian Enameling & Stamping Co., Inc., Terre Haute, Ind., a corporation of Indiana
Application July 26, 1937, Serial No. 70,628
Term of patent 7 years



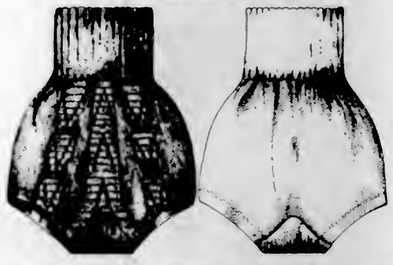
The ornamental design for a combinet, as shown.

107,100
DESIGN FOR A CAKE SERVER OR SIMILAR ARTICLE
Harry Rietveld, Milwaukee, Wis.
Substituted for abandoned application Serial No. D-65,421, October 22, 1936. This application September 10, 1937, Serial No. 71,561
Term of patent 7 years



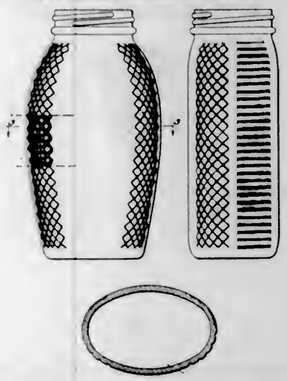
The ornamental design for a cake server or similar article as shown.

107,101
DESIGN FOR A CARRYING CASE FOR A CAMERA
Robert Sanborn, Muskegon, Mich.
Application November 16, 1936, Serial No. 65,924
Term of patent 3½ years



The ornamental design for a carrying case for a camera, as shown and described.

107,102
DESIGN FOR A CLOCK CASE
Max Schlenker, La Salle, Ill., assignor to General Time Instruments Corporation, New York, N. Y., a corporation of Delaware
Application September 30, 1937, Serial No. 71,869
Term of patent 7 years

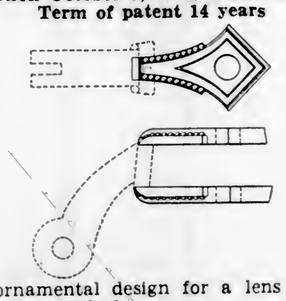


The ornamental design for a clock case, as shown.

107,103
DESIGN FOR KNITTED TRUNKS
Lewis Silberman, Brooklyn, N. Y.
Application September 4, 1937, Serial No. 71,484
Term of patent 3½ years

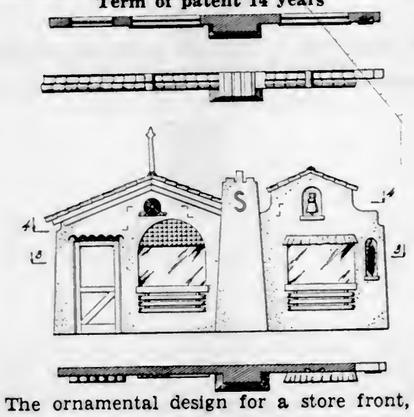
The ornamental design for knitted trunks as shown.

107,104
DESIGN FOR A JAR
Norman F. Steuer, San Francisco, Calif., assignor to Owens-Illinois Pacific Coast Company, San Francisco, Calif., a corporation of Delaware
Application September 22, 1937, Serial No. 71,724
Term of patent 14 years



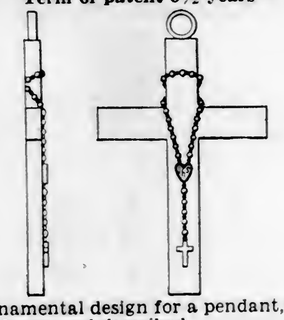
The ornamental design for a jar, substantially as shown and described.

107,105
DESIGN FOR A LIGHTING TROUGH OR SIMILAR ARTICLE
Lemuel L. Stewart, Chicago, Ill., assignor to The Adlake Company, a corporation of Illinois
Application May 10, 1937, Serial No. 69,258
Term of patent 14 years



The ornamental design for a lighting trough or similar article, substantially as shown.

107,106
DESIGN FOR A LENS STRAP
Harwood S. Taylor, Rochester, N. Y., assignor to Shuron Optical Company, Inc., Geneva, N. Y., a corporation of New York
Application October 9, 1937, Serial No. 72,094
Term of patent 14 years



The ornamental design for a lens strap, as shown and described.

107,107
DESIGN FOR A STORE FRONT
Kenneth E. Bemis, Oakland, Calif.
Application September 25, 1937, Serial No. 71,802
Term of patent 14 years

The ornamental design for a store front, as shown.

107,108
DESIGN FOR A PENDANT
Frank A. Blasi, Newark, N. J.
Application August 4, 1937, Serial No. 70,846
Term of patent 3½ years

The ornamental design for a pendant, substantially as shown and described.

107,109
DESIGN FOR A FALLING WEDGE
John Henry Carter, Bend, Oreg.
Application May 14, 1937, Serial No. 69,361
Term of patent 14 years

The ornamental design for a falling wedge as shown and described.

107,110
DESIGN FOR A CLIP OR SIMILAR ARTICLE
Adolph Katz, New York, N. Y.
Application October 14, 1937, Serial No. 72,153
Term of patent 3½ years

The ornamental design for a clip or similar article substantially as shown.

107,111
DESIGN FOR A CLIP OR SIMILAR ARTICLE
Adolph Katz, New York, N. Y.
Application October 14, 1937, Serial No. 72,154
Term of patent 3½ years

The ornamental design for a clip or similar article substantially as shown.

107,112
DESIGN FOR A CLIP OR SIMILAR ARTICLE
Adolph Katz, New York, N. Y.
Application October 14, 1937, Serial No. 72,155
Term of patent 3½ years

The ornamental design for a clip or similar article substantially as shown.

107,113
DESIGN FOR A CLIP OR SIMILAR ARTICLE
Adolph Katz, New York, N. Y.
Application October 14, 1937, Serial No. 72,156
Term of patent 3½ years

The ornamental design for a clip or similar article substantially as shown.

107,114
DESIGN FOR A CLIP OR SIMILAR ARTICLE
Adolph Katz, New York, N. Y.
Application October 14, 1937, Serial No. 72,157
Term of patent 3½ years

The ornamental design for a clip or similar article substantially as shown.

107,115
DESIGN FOR A CLIP OR SIMILAR ARTICLE
Adolph Katz, New York, N. Y.
Application October 14, 1937, Serial No. 72,158
Term of patent 3½ years

The ornamental design for a clip or similar article substantially as shown.

107,116
DESIGN FOR A CLIP OR SIMILAR ARTICLE
Adolph Katz, New York, N. Y.
Application October 14, 1937, Serial No. 72,159
Term of patent 3½ years

The ornamental design for a clip or similar article substantially as shown.

107,117
DESIGN FOR A CLIP OR SIMILAR ARTICLE
Adolph Katz, New York, N. Y.
Application October 14, 1937, Serial No. 72,160
Term of patent 3½ years

The ornamental design for a clip or similar article substantially as shown.

107,118
DESIGN FOR A CLIP OR SIMILAR ARTICLE
Adolph Katz, New York, N. Y.
Application October 14, 1937, Serial No. 72,161
Term of patent 3½ years

The ornamental design for a clip or similar article, substantially as shown.

107,119
DESIGN FOR A CLIP OR SIMILAR ARTICLE
Adolph Katz, New York, N. Y.
Application October 14, 1937, Serial No. 72,162
Term of patent 3½ years

The ornamental design for a clip or similar article, substantially as shown.

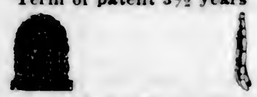
107,120
DESIGN FOR A CLIP OR SIMILAR ARTICLE
Adolph Katz, New York, N. Y.
Application October 14, 1937, Serial No. 72,163
Term of patent 3½ years

The ornamental design for a clip or similar article, substantially as shown.

107,121
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application September 11, 1937, Serial No. 71,572
Term of patent 3½ years

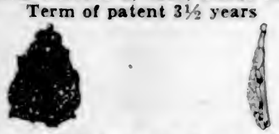
The ornamental design for a clip, substantially as shown and described.

107,122
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application September 11, 1937, Serial No. 71,573
Term of patent 3½ years



The ornamental design for a clip, substantially as shown and described.

107,123
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 71,998
Term of patent 3½ years

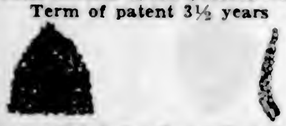


The ornamental design for a clip, substantially as shown and described.

107,124
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 71,999
Term of patent 3½ years

The ornamental design for a clip, substantially as shown and described.

107,125
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,000
Term of patent 3½ years



The ornamental design for a clip, substantially as shown and described.

107,126
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,001
Term of patent 3½ years

The ornamental design for a clip substantially as shown and described.

107,127
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,002
Term of patent 3½ years

The ornamental design for a clip, substantially as shown and described.

107,128
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,003
Term of patent 3½ years

The ornamental design for a clip substantially as shown and described.

107,129
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,004
Term of patent 3½ years

The ornamental design for a clip substantially as shown and described.

107,130
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,005
Term of patent 3½ years

The ornamental design for a clip substantially as shown and described.

107,131
DESIGN FOR A BROOCH
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,006
Term of patent 3½ years

The ornamental design for a brooch substantially as shown and described.

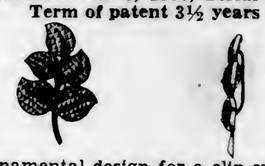
107,132
DESIGN FOR A BROOCH
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,007
Term of patent 3½ years

The ornamental design for a brooch substantially as shown and described.

107,133
DESIGN FOR A BROOCH
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,008
Term of patent 3½ years

The ornamental design for a brooch substantially as shown and described.

107,134
DESIGN FOR A BROOCH
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,009
Term of patent 3½ years

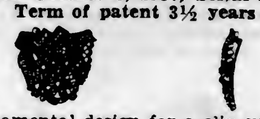


The ornamental design for a brooch substantially as shown and described.

107,135
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,013
Term of patent 3½ years

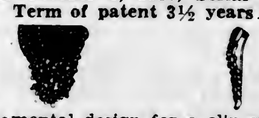
The ornamental design for a clip substantially as shown and described.

107,136
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,014
Term of patent 3½ years



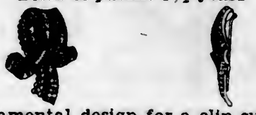
The ornamental design for a clip substantially as shown and described.

107,137
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,016
Term of patent 3½ years



The ornamental design for a clip substantially as shown and described.

107,138
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,017
Term of patent 3½ years



The ornamental design for a clip substantially as shown and described.

107,139
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,018
Term of patent 3½ years

The ornamental design for a clip substantially as shown and described.

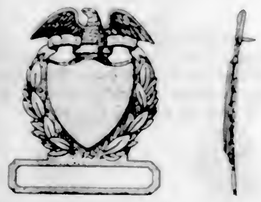
107,140
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,019
Term of patent 3½ years

The ornamental design for a clip substantially as shown and described.

107,141
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,020
Term of patent 3½ years

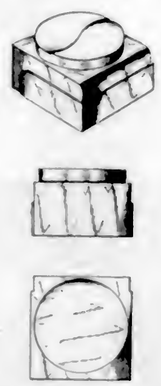
The ornamental design for a clip substantially as shown and described.

107,142
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,021
Term of patent 3½ years



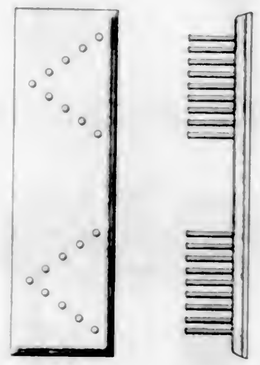
The ornamental design for a clip substantially as shown and described.

107,143
DESIGN FOR A CLIP
Alfred Philippe, New York, N. Y., assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y.
Application October 6, 1937, Serial No. 72,022
Term of patent 3½ years



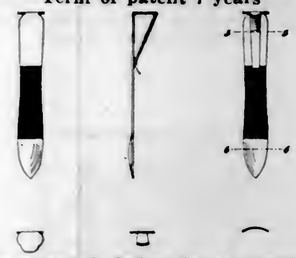
The ornamental design for a clip substantially as shown and described.

107,144
DESIGN FOR A BADGE OR SIMILAR ARTICLE
Sigmund Stingel, Pittsburgh, Pa.
Application August 11, 1937, Serial No. 71,011
Term of patent 7 years



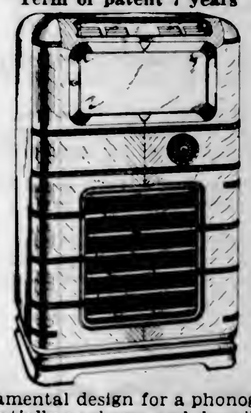
The ornamental design for a badge or similar article, as shown.

107,145
DESIGN FOR A COSMETIC CONTAINER
Adam Baker Barnhart, New York, N. Y., assignor to Jacqueline Cochran, doing business as J. C. Laboratories, Roselle, N. J.
Application August 18, 1937, Serial No. 71,180
Term of patent 14 years



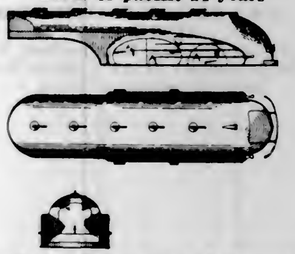
The ornamental design for a cosmetic container, as shown.

107,146
DESIGN FOR A NECKTIE RACK OR THE LIKE
Abe R. Brothers, Brooklyn, N. Y.
Application October 1, 1937, Serial No. 71,915
Term of patent 14 years



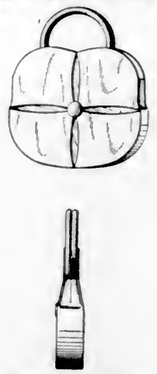
The ornamental design for a necktie rack or the like, substantially as shown and described.

107,147
DESIGN FOR A COMBINED NAIL FILE AND PIPE TAMP
Harry C. French, Cleveland, Ohio
Application June 15, 1937, Serial No. 69,855
Term of patent 7 years



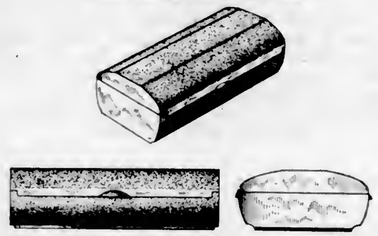
The ornamental design for a combined nail file and pipe tamp as shown.

107,148
DESIGN FOR A PHONOGRAPH CABINET
Paul M. Fuller, Chicago, Ill., assignor to The Rudolph Wurlitzer Company, North Tonawanda, N. Y., a corporation of Ohio
Application October 4, 1937, Serial No. 71,952
Term of patent 7 years



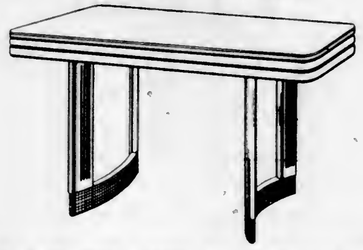
The ornamental design for a phonograph cabinet, substantially as shown and described.

107,149
DESIGN FOR A SEMITRAILER TANK BODY
Edward H. Gill, Kansas City, Mo., assignor to Andrew A. Kramer, Kansas City, Mo.
Application April 22, 1937, Serial No. 68,933
Term of patent 14 years



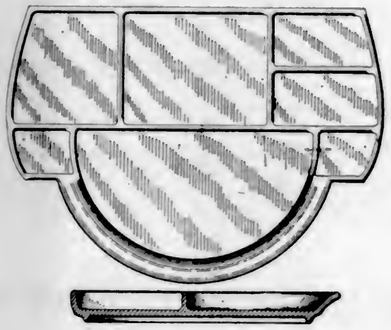
The ornamental design for a semitrailer tank body substantially as shown.

107,150
DESIGN FOR A HANDBAG
Samuel R. Goldsmith, New York, N. Y.
Application October 23, 1937, Serial No. 72,386
Term of patent 3½ years



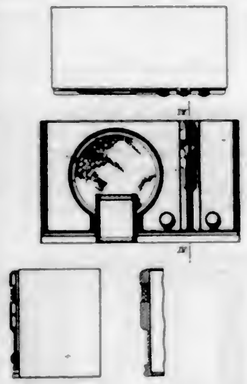
The ornamental design for a handbag substantially as shown.

107,151
DESIGN FOR A SHAVING SOAP CONTAINER
Jean Helleu, Paris, France, assignor to Bourjois, Inc., New York, N. Y., a corporation of New York
Application September 14, 1937, Serial No. 71,607
Term of patent 3½ years



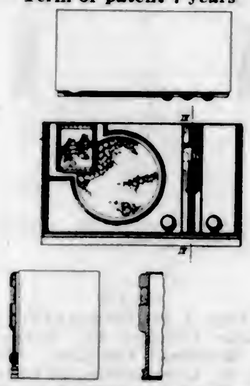
The ornamental design for a shaving soap container as shown.

107,152
DESIGN FOR A DINING TABLE
George McStay Jackson, Lake Bluff, Ill., assignor to The Hoosier Manufacturing Company, New Castle, Ind., a corporation of Indiana
Application August 23, 1937, Serial No. 71,260
Term of patent 3½ years



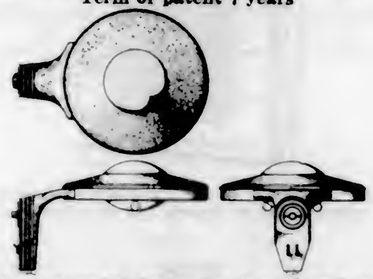
The ornamental design for a dining table, as shown.

107,153
DESIGN FOR AN ENTREE PLATE
Joseph Kenneth Johnson, Jersey City, N. J.
Application July 2, 1937, Serial No. 70,230
Term of patent 14 years



The ornamental design for an entree plate as shown.

107,154
DESIGN FOR A RADIO CABINET
Reginald B. Meller, San Francisco, Calif., assignor to Henry Wolff Company, San Francisco, Calif., a co-partnership composed of Henry Wolff and John L. Shell
Application June 24, 1937, Serial No. 70,038
Term of patent 7 years

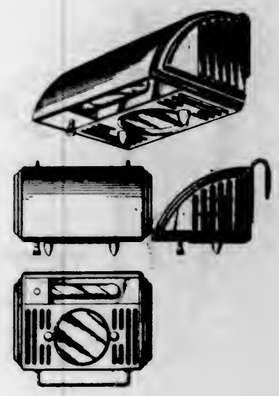


The ornamental design for a radio cabinet, substantially as shown and described.

107,155
DESIGN FOR A RADIO CABINET
Reginald B. Meller, San Francisco, Calif., assignor to Henry Wolff Company, San Francisco, Calif., a co-partnership composed of Henry Wolff and John L. Shell
Application June 24, 1937, Serial No. 70,039
Term of patent 7 years

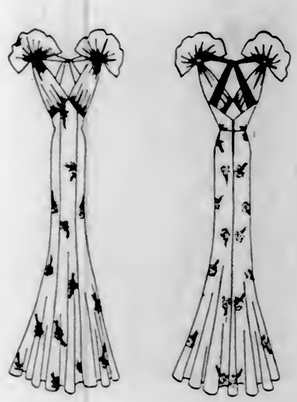
The ornamental design for a radio cabinet, substantially as shown and described.

107,156
DESIGN FOR A COMBINED PEDESTAL HEAD AND HOUSING FOR HAIR WAVING MACHINES
Floyd V. Schleimer, San Francisco, Calif., assignor to Duart Manufacturing Company, Ltd., San Francisco, Calif., a corporation of California
Application August 9, 1937, Serial No. 70,943
Term of patent 7 years



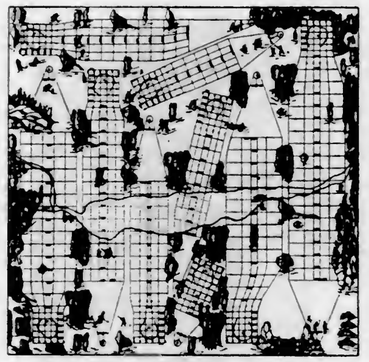
The ornamental design for a combined pedestal head and housing for hair waving machines, substantially as shown.

107,157
DESIGN FOR A CLOTHES STICK OR SIMILAR ARTICLE
Elizabeth F. Thomas, Binghamton, N. Y.
Application September 21, 1937, Serial No. 71,700
Term of patent 14 years



The ornamental design for a clothes stick or similar article, as shown.

107,158
DESIGN FOR A COMBINED RADIO RECEIVING SET AND BED LAMP
Leonard Tulauskas, Chicago, Ill., assignor to Climax Radio & Television Co., Chicago, Ill., a corporation of Illinois
Application September 22, 1937, Serial No. 71,713
Term of patent 7 years



The ornamental design for a combined radio receiving set and bed lamp, substantially as shown.

107,159
DESIGN FOR A DRESS
Benjamin Fried, New York, N. Y.
Application October 20, 1937, Serial No. 72,326
Term of patent 3½ years

The ornamental design for a dress substantially as shown.

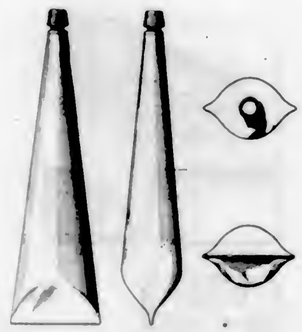
107,160
DESIGN FOR A GAME BOARD
Alton Schuster, Toledo, Ohio
Application May 24, 1937, Serial No. 69,528
Term of patent 3½ years

The ornamental design for a game board substantially as shown and described.

107,161
DESIGN FOR A BEANPOT
Chester C. Soule, Portland, Maine
Application October 13, 1937, Serial No. 72,147
Term of patent 14 years

The ornamental design for a beanpot, as shown.

107,162
DESIGN FOR A BEANPOT
Chester C. Soule, Portland, Maine
Application October 13, 1937, Serial No. 72,148
Term of patent 14 years

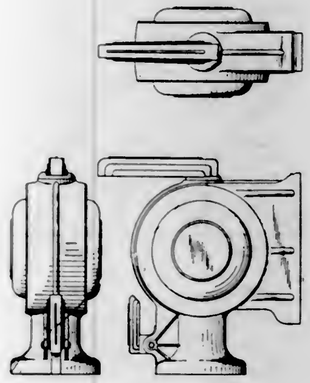


The ornamental design for a beanpot, as shown.

107,163
DESIGN FOR A BEANPOT
Chester C. Soule, Portland, Maine
Application October 13, 1937, Serial No. 72,149
Term of patent 14 years

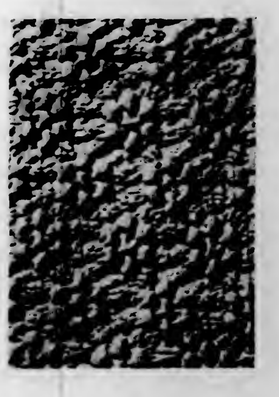
The ornamental design for a beanpot, as shown.

107,164
DESIGN FOR A COLLAPSIBLE CONTAINER
Herman L. Strongson, New York, N. Y., assignor to Glida Corp. of America, New York, N. Y., a corporation of New York
Application December 21, 1936, Serial No. 66,673
Term of patent 3½ years



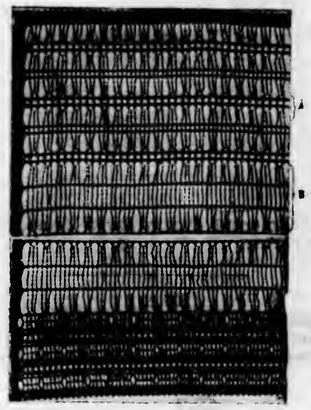
The ornamental design for a collapsible container, as shown.

107,165
DESIGN FOR A DRESS
Philip Wenett, New York, N. Y.
Application October 25, 1937, Serial No. 72,401
Term of patent 3½ years



The ornamental design for a dress, substantially as shown, and described.

107,166
DESIGN FOR A WRINGER HEAD
Howard Witmer, Newton, Iowa, assignor to One Minute Washer Company, Newton, Iowa, a corporation of Iowa
Application April 17, 1937, Serial No. 68,839
Term of patent 7 years



The ornamental design for a wringer head as shown.

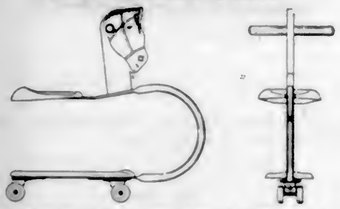
107,167
DESIGN FOR A TEXTILE FABRIC OR SIMILAR ARTICLE
Rudolph Dannecker, Beacon, N. Y.
Application October 16, 1937, Serial No. 72,234
Term of patent 3½ years

The ornamental design for a textile fabric or similar article as shown and described.

107,168
DESIGN FOR A CURTAIN
Gustave F. Erhard, Scranton, Pa., assignor to The Scranton Lace Company, Scranton, Pa., a corporation of Pennsylvania
Application October 15, 1937, Serial No. 72,186
Term of patent 3½ years

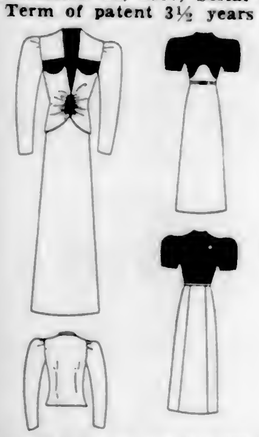
The ornamental design for a curtain substantially as shown and described.

107,169
DESIGN FOR A DRESS
Pauline Fracchia, New York, N. Y.
Application October 14, 1937, Serial No. 72,175
Term of patent 3½ years



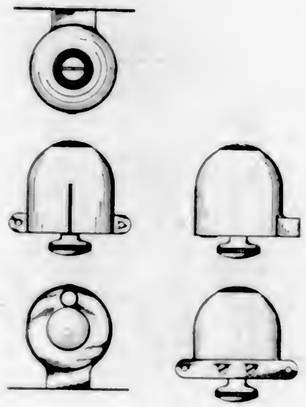
The ornamental design for a dress, substantially as shown.

107,170
DESIGN FOR A DRESS
Pauline Fracchia, New York, N. Y.
Application October 18, 1937, Serial No. 72,249
Term of patent 3½ years



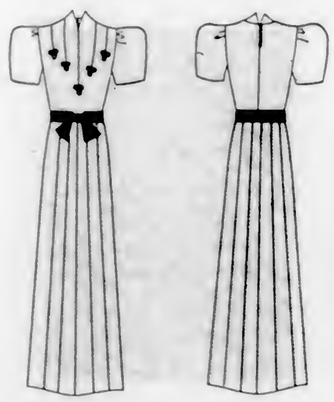
The ornamental design for a dress, substantially as shown.

107,171
DESIGN FOR A CHILD'S TOY
Clarence E. Garton, Sheboygan, Wis.
Application September 9, 1937, Serial No. 71,516
Term of patent 3½ years



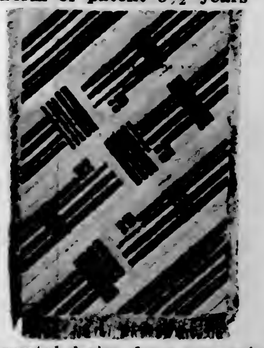
The ornamental design for a child's toy, as shown.

107,172
DESIGN FOR A DRESS ENSEMBLE
Goodwin Isaacs, New York, N. Y.
Application October 14, 1937, Serial No. 72,152
Term of patent 3½ years



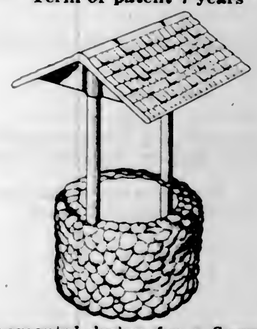
The ornamental design for a dress ensemble, substantially as shown.

107,173
DESIGN FOR A SALT TABLET DISPENSER
Robert A. Kelly, East Pittsburgh, and Paul C. Perrin, Pittsburgh, Pa., assignors to Mine Safety Appliances Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application September 27, 1937, Serial No. 71,825
Term of patent 14 years



The ornamental design for a salt tablet dispenser as shown.

107,174
DESIGN FOR A DRESS
Jacob J. Kushner, New York, N. Y.
Application October 11, 1937, Serial No. 72,114
Term of patent 3½ years



The ornamental design for a dress substantially as shown and described.

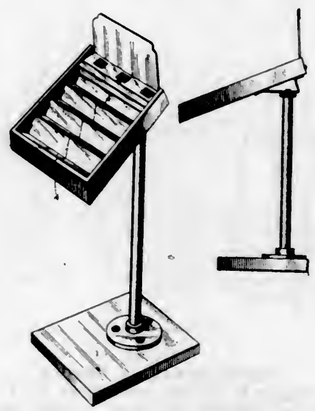
107,175
DESIGN FOR A RUG
George E. Mallinson, Amityville, N. Y.
Application October 15, 1937, Serial No. 72,199
Term of patent 3½ years

The ornamental design for a rug, substantially as shown and described.

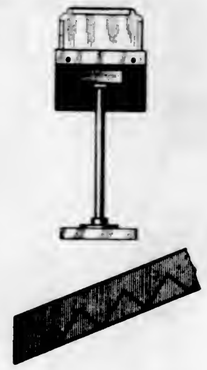
107,176
DESIGN FOR A FLOWER HOLDER OR SIMILAR ARTICLE
Harold Joseph Meyer, Galesburg, Ill., assignor to Western Stoneware Company, Monmouth, Ill., a corporation of Maine
Application August 20, 1936, Serial No. 64,491
Term of patent 7 years

The ornamental design for a flower holder or similar article, as shown.

107,177
DESIGN FOR A KNITTED FABRIC
Jack Minoff, Newark, N. J.
Application October 25, 1937, Serial No. 72,402
Term of patent 14 years

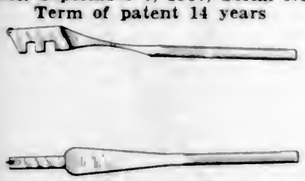


The ornamental design for a knitted fabric substantially as shown.



107,178
DESIGN FOR A PLAYING CARD
Raymond Francis Nekuda, Kansas City, Mo.
Application January 30, 1937, Serial No. 67,353
Term of patent 14 years

The ornamental design for a playing card as shown.



107,179
DESIGN FOR A DISPLAY STAND
John G. Toomey, New York, N. Y., assignor to Park & Tilford, New York, N. Y., a corporation of New York
Application September 10, 1937, Serial No. 71,543
Term of patent 7 years

The ornamental design for a display stand as shown.

107,180
DESIGN FOR A GLASS CUTTER
Guy C. Wyman, Chatham, N. J., assignor to Landon P. Smith, Incorporated, Irvington, N. J., a corporation of New Jersey
Application September 7, 1937, Serial No. 71,499
Term of patent 14 years

The ornamental design for a glass cutter, as shown.

107,181
DESIGN FOR A DRESS
Marie R. Berger, New York, N. Y.
Application October 28, 1937, Serial No. 72,479
Term of patent 3½ years

The ornamental design for a dress, substantially as shown.

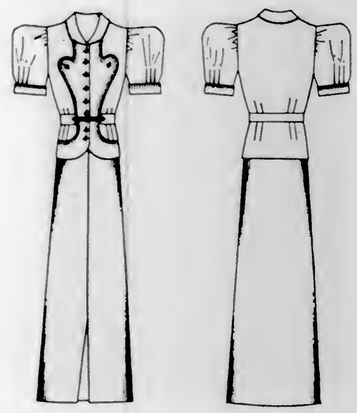
107,182
DESIGN FOR A DRESS
Marie R. Berger, New York, N. Y.
Application October 28, 1937, Serial No. 72,480
Term of patent 3½ years

The ornamental design for a dress, substantially as shown.

107,183
DESIGN FOR A TEXTILE FABRIC
John W. H. Brooks, Philadelphia, Pa.
Application October 20, 1937, Serial No. 72,324
Term of patent 3½ years

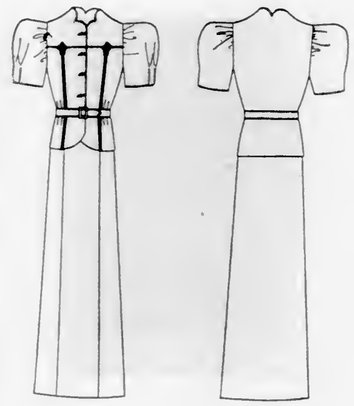
The ornamental design for a textile fabric substantially as shown.

107,184
DESIGN FOR A SPORT SHIRT
Helena Schmidt Buffett, Honolulu, Territory of Hawaii
Application June 30, 1937, Serial No. 70,187
Term of patent 7 years



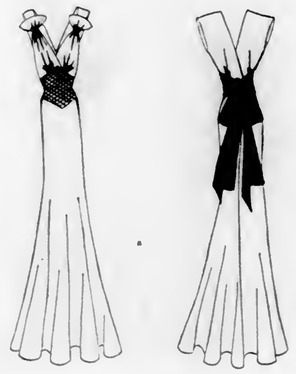
The ornamental design for a sport shirt, as shown.

107,185
DESIGN FOR A DRESS
Marie Efantes, New York, N. Y.
Application October 29, 1937, Serial No. 72,494
Term of patent 3½ years



The ornamental design for a dress substantially as shown.

107,186
DESIGN FOR A DRESS
Marie Efantes, New York, N. Y.
Application October 29, 1937, Serial No. 72,495
Term of patent 3½ years

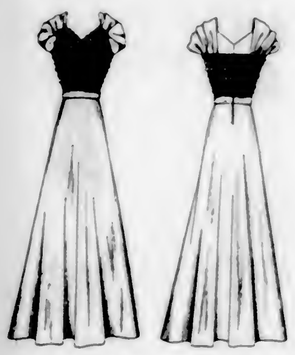


The ornamental design for a dress substantially as shown.

107,187
DESIGN FOR A DRESS
Marie Efantes, New York, N. Y.
Application October 29, 1937, Serial No. 72,496
Term of patent 3½ years

The ornamental design for a dress substantially as shown.

107,188
DESIGN FOR A DRESS
Benjamin Fried, New York, N. Y.
Application October 26, 1937, Serial No. 72,431
Term of patent 3½ years

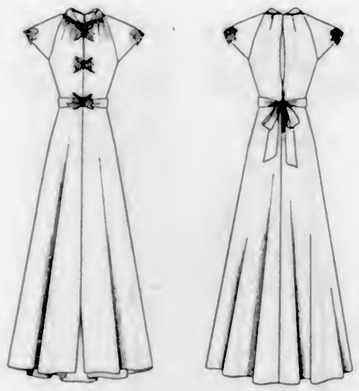


The ornamental design for a dress, substantially as shown.

107,189
DESIGN FOR A CURTAIN
Frederich Gentner, Philadelphia, Pa.
Application September 22, 1937, Serial No. 71,729
Term of patent 3½ years

The ornamental design for a curtain, substantially as shown.

107,190
DESIGN FOR A DRESS
Mercedes Hall, New York, N. Y.
Application October 30, 1937, Serial No. 72,527
Term of patent 3½ years



The ornamental design for a dress, substantially as shown.

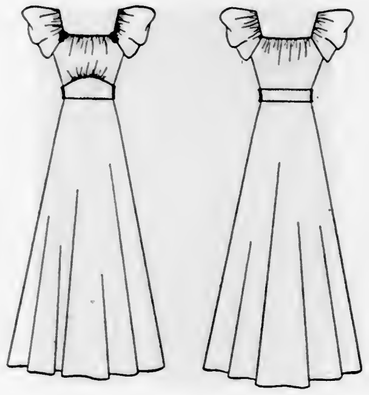
107,191
DESIGN FOR A DRESS
Mercedes Hall, New York, N. Y.
Application October 30, 1937, Serial No. 72,528
Term of patent 3½ years

The ornamental design for a dress, substantially as shown.

107,192
DESIGN FOR A DRESS
Ida Lampel, New York, N. Y.
Application October 28, 1937, Serial No. 72,481
Term of patent 3½ years

The ornamental design for a dress, substantially as shown.

107,193
DESIGN FOR AN EMBROIDERED FABRIC
Morris Leff, New York, N. Y.
Application October 29, 1937, Serial No. 72,489
Term of patent 3½ years

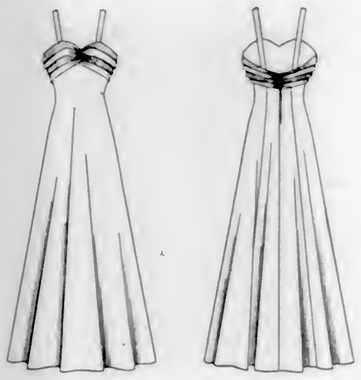


The ornamental design for an embroidered fabric, substantially as shown.

107,194
DESIGN FOR AN EMBROIDERED FABRIC
Morris Leff, New York, N. Y.
Application October 29, 1937, Serial No. 72,490
Term of patent 3½ years

The ornamental design for an embroidered fabric, substantially as shown.

107,195
DESIGN FOR A DRESS
Margaret Michelson, New York, N. Y.
Application October 25, 1937, Serial No. 72,398
Term of patent 3½ years

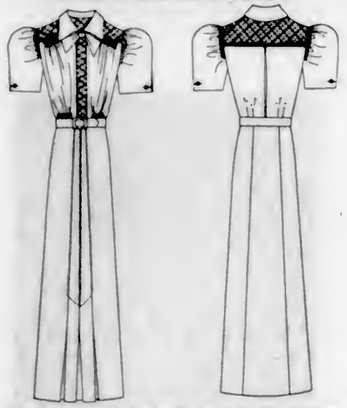


The ornamental design for a dress, substantially as shown and described.

107,196
DESIGN FOR A DRESS
Margaret Michelson, New York, N. Y.
Application October 27, 1937, Serial No. 72,446
Term of patent 3½ years

The ornamental design for a dress, substantially as shown.

107,197
DESIGN FOR A DRESS
Margaret Michelson, New York, N. Y.
Application October 27, 1937, Serial No. 72,447
Term of patent 3½ years



The ornamental design for a dress, substantially as shown.

107,198
DESIGN FOR A TEXTILE FABRIC
Edmund M. Patterson, New York, N. Y.
Application October 20, 1937, Serial No. 72,331
Term of patent 3½ years

The ornamental design for a textile fabric substantially as shown.

107,199
DESIGN FOR A DRESS
Katheryn Rost, New York, N. Y.
Application October 29, 1937, Serial No. 72,497
Term of patent 3½ years

The ornamental design for a dress substantially as shown.

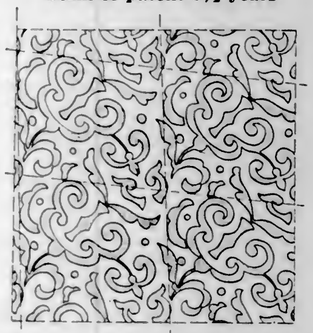
107,200
DESIGN FOR A DECORATIVE NAIL
Benjamin Salzberg, New York, N. Y.
Application October 14, 1937, Serial No. 72,166
Term of patent 3½ years

The ornamental design for a decorative nail, substantially as shown.

107,201
DESIGN FOR A DRESS
Carolyn M. Santore, New York, N. Y.
Application October 27, 1937, Serial No. 72,444
Term of patent 3½ years

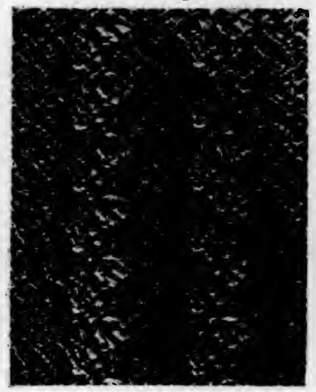
The ornamental design for a dress, substantially as shown.

107,202
DESIGN FOR A DRESS
Philip Schlessel, New York, N. Y.
Application October 23, 1937, Serial No. 72,382
Term of patent 3½ years



The ornamental design for a dress, substantially as shown.

107,203
DESIGN FOR A DRESS
Philip Schlessel, New York, N. Y.
Application October 25, 1937, Serial No. 72,400
Term of patent 3½ years



The ornamental design for a dress, substantially as shown.

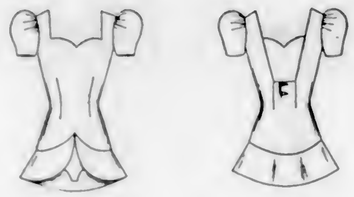
107,204
DESIGN FOR A TEXTILE FABRIC
Nathan Tillman, Brooklyn, N. Y.
Application November 1, 1937, Serial No. 72,563
Term of patent 3½ years

The ornamental design for a textile fabric substantially as shown.

107,205
DESIGN FOR A TEXTILE FABRIC
Mark Turpan, West New York, N. J.
Application October 20, 1937, Serial No. 72,334
Term of patent 7 years

The ornamental design for a textile fabric substantially as shown.

107,206
DESIGN FOR A TEXTILE FABRIC
Mark Turpan, West New York, N. J.
Application October 20, 1937, Serial No. 72,335
Term of patent 7 years



The ornamental design for a textile fabric substantially as shown.

107,207
DESIGN FOR A DRESS
Mildred Wagner, New York, N. Y.
Application October 23, 1937, Serial No. 72,383
Term of patent 3½ years

The ornamental design for a dress substantially as shown.

107,208
DESIGN FOR A BATHING SUIT
Mildred Tunick, New York, N. Y.
Application October 20, 1937, Serial No. 72,332
Term of patent 3½ years

The ornamental design for a bathing suit, substantially as shown.

THE
OFFICIAL GAZETTE
OF THE
United States Patent Office

Vol. 484—No. 5 TUESDAY, NOVEMBER 30, 1937 Price—$16 per year

The OFFICIAL GAZETTE is mailed under the direction of the Superintendent of Documents, Government Printing Office, to whom all subscriptions should be made payable and all communications respecting the Gazette should be addressed. Issued weekly. Subscriptions, $16.00 per annum, including annual index, $18.75; single numbers, 35 cents each.
PRINTED COPIES OF PATENTS are furnished by the Patent Office at 10 cents each. For the latter address the Commissioner of Patents, Washington, D. C.
CIRCULARS OF GENERAL INFORMATION concerning PATENTS or concerning TRADE-MARKS, PRINTS, and LABELS will be sent without cost on request to the Commissioner of Patents, Washington, D. C.

Interference Notices

U. S. PATENT OFFICE, *Washington, D. C., Nov. 4, 1937.*

Florida Citrus Products Corporation, its assigns or legal representatives, take notice:

An interference having been declared by this Office between the application of Redlands Mutual Orange Association, 331 North Fourth St., Redlands, California, for registration of a trade-mark and trade-mark registered February 15, 1927, No. 224,038, to Florida Citrus Products Corporation, Haines City, Florida, and 136 Franklin St., New York, N. Y., and the notice of such proceeding sent by registered mail to said Florida Citrus Products Corporation at the said addresses having been returned by the post office as undeliverable, notice is hereby given that unless said Florida Citrus Products Corporation, its assigns or legal representatives, shall enter an appearance therein within thirty days from the first publication of this order the interference will be proceeded with as in the case of default. This notice will be published in the OFFICIAL GAZETTE for three consecutive weeks.

JUSTIN W. MACKLIN,
First Assistant Commissioner.

U. S. PATENT OFFICE, *Washington, D. C., Nov. 4, 1937.*

Charles N. Cox, his assigns or legal representatives, take notice:

An interference having been declared by this Office between the application of Redlands Mutual Orange Association, 331 North Fourth St., Redlands, California, for registration of a trade-mark and trade-mark registered February 21, 1928, No. 239,038, to Charles N. Cox, 421 Flamingo Drive, West Palm Beach, Florida, and the Office having been unable to obtain satisfactory service upon said Cox, notice is hereby given that unless said Charles N. Cox, his assigns or legal representatives, shall enter an appearance therein within thirty days from the first publication of this order the interference will be proceeded with as in the case of default. This notice will be published in the OFFICIAL GAZETTE for three consecutive weeks.

JUSTIN W. MACKLIN,
First Assistant Commissioner.

Condition of Applications Under Examination at Close of Business November 13, 1937

(Total number of applications awaiting action, excluding Trade-Mark Division, 42,296; Trade-Mark Division, 1,572. Oldest new case, May 18, 1937; oldest amended, May 1, 1937.)

DECISIONS IN PATENT AND TRADE-MARK CASES

U. S. Court of Appeals for the District of Columbia

UNITED STATES EX RELATIONE SOCIETE DE CONDENSATION ET D'APPLICATIONS MECANIQUES

v.

COE, COMMISSIONER OF PATENTS

No. 6,874. Decided March 29, 1937. Rehearing denied June 2, 1937. Certiorari denied by the Supreme Court of the United States Oct. 11, 1937. Rehearing denied Nov. 8, 1937.

MANDAMUS—DISMISSAL OF APPEAL UNDER RULE 162.

Mandamus to compel Commissioner to dismiss under rule 162, appeal to Board of Appeals by losing party in interference who failed to file typewritten copies of record for use of the Board within the thirty day period specified in the rule but filed the same within a further period granted by the Board *Held* properly denied.

APPEAL from the District Court of the United States for the District of Columbia. Affirmed.

STEPHENS, *J.*, dissenting.

Mr. Philip Mauro and *Mr. Reeve Lewis* for U. S. Ex Rel. Societe de Condensation et D'Applications Mecaniques.

Mr. R. F. Whitehead for the Commissioner of Patents.

Before MARTIN, Chief Justice, and ROBB, GRONER, and STEPHENS, Associate Justices

ROBB, *A. J.:*

Appeal from a judgment in the District Court of the United States for the District of Columbia dismissing appellant's petition for a writ of mandamus to compel the Commissioner of Patents to dismiss, or cause to be dismissed, an appeal to the Board of Appeals in interference No. 59,444 between Paul Langevin, assignor to petitioner, and Alexander Nicolson.

The Examiner of Interferences on July 20, 1935, awarded priority to Langevin. From that decision Nicolson on August 17, 1935, noted an appeal to the Board of Appeals. Patent Office Rule 162, as amended, prescribes the procedure on appeals to the Board of Appeals, and provides that printing of the record may be dispensed with, upon request, where the record does not exceed a certain number of pages; and

"that where printing has thus been dispensed with, the appellant, if appeal is taken from the decision of the Examiner of Interferences, may file three clearly legible typewritten copies of the record, both of his own and the appellee, if the same have not been printed, and which shall not become a part of the record, within thirty days from the taking of the appeal. *If the copies of the record are not filed within the time specified or within any extension thereof granted by the Board of Appeals, the appeal shall be dismissed.* [Emphasis ours.]

Nicolson did not file the three copies of the record within the thirty day period (expiring September 16, 1935). On December 3d, following, the Board of Appeals in a communication to Nicolson and Langevin stated:

"Counsel for the appellee (Langevin) has called our attention to the fact the appellant (Nicolson) has not filed in the Office the three typewritten copies of the record, both of his own and the appellee, required by the second paragraph of rule 162 to be filed within thirty days from the date of the appeal. The appeal was taken on August 17, 1935. If such copies are not filed within ten days from the date of this letter, or sufficient cause shown why such action should not be taken, the appeal will be dismissed."

In response to the Board's communication of December 3d Nicolson (on December 11th) filed three typewritten copies of the record. In his letter transmitting the copies, Nicolson stated that the delay

"was entirely an inadvertent error resulting from the unfamiliarity of appellant's (Nicolson's) counsel with the procedure with respect to the use of typewritten records."

Meantime, on December 9th, Langevin filed a motion to set aside the Board's action of December 3d and for an order dismissing Nicolson's appeal. Thereupon, in a further communication to Nicolson, the Board, in view of Langevin's opposition, required Nicolson to "make a verified showing in excuse for his delay." He was given until December 24th to file such "showing." Langevin was given until December 31st to file any arguments he might care to advance against the sufficiency of Nicolson's showing. Action on Langevin's motion to set aside and dismiss was deferred until December 31st, or until Nicolson's showing and Langevin's response had been received.

The case came on to be heard before the Board, and on January 7, 1936, that tribunal in a written decision stated that the typewritten copies had been filed by Nicolson on December 11, 1935, within the extension granted on December 3d; that Langevin contended the rule is mandatory, and that the Board was without discretion and must dismiss the appeal. The Board continued:

"The rule specifically states that these typewritten copies shall not become a part of the record. They are required merely for the benefit of the Board, but in themselves constitute no part either of the appeal or the permanent record. Had the rule required appellant [Nicolson] to furnish the appellee [Langevin] with these copies and appellee had waived this requirement, no reasonable interpretation of the rule would have required dismissal of the appeal merely because the wording of the rule had not been strictly complied with. Likewise it seems to us that since the copies form no part of the record, but are merely filed for the convenience of the Board, we have the authority to waive the requirement of the rule as to their filing, if we so desire. We did not, however, waive the requirement of the rule, but extended appellant's period in which to file the copies and they were filed within the extension granted by us. * * *"

Thereupon the supervisory authority of the Commissioner was invoked to the end that he require the appeal of Nicolson to be dismissed. The petition was denied. In his written decision the Commissioner said:

"It is important to observe that the requirement for the filing of the three typewritten copies of the record by the appellant [Nicolson] is not only primarily but solely for the benefit of the three members of the Board of Appeals. These copies are not available to either the appellant or the appellee and neither, as the rule plainly states, do they become a part of the record. The observance of the rule by the appellant does not benefit the appellee and neither does its breach create any equitable or legal right in the appellee. Under these circumstances I do not feel that this office should resort to such a harsh and technical interpretation of a rule created for its own benefit as to disavow those equitable principles underlying the procedure and practice of the Patent Office."

It must be kept in mind that the Commissioner

was interpreting one of his own rules, procedural in character.

"Words like may, must, shall, and so forth, are constantly used in statutes without intending that they shall be taken literally, and in their construction the object evidently designed to be reached limits and controls the literal import of the terms and phrases employed."

Field v. *United States*, 27 App. D. C. 433, 440. In *West Wisconsin Railway Co.* v. *Foley*, 94 U. S. 100, the court considered one of its own rules providing that where a writ of error shall delay the proceedings of an inferior court and shall appear to have been sued merely for delay,

"damages at the rate of ten per cent, in addition to interest, shall be awarded upon the amount of the judgment."

The court held that the rule should be construed as limiting the amount beyond which the court could not go, but that, in its discretion, it could give less. See, also, *Escoe* v. *Zerbst*, 295 U. S. 490.

Patent Office Rule 162, as finally amended, was designed to relieve an appealing party of the burden of printing the record, where the testimony does not exceed the specified number of pages. The provision requiring the appealing party to furnish legible typewritten copies of the record was, as ruled by the Board and the Commissioner, "for the convenience of the Board." The provision that the appeal shall be dismissed if the copies of the record are not filed within the time specified or within any extension thereof granted by the Board of Appeals was to prevent unreasonable delay. Both the Board and the Commissioner, in the exercise of their discretion, extended the time within which the copies should be filed. It would require a much stronger showing than has been made here to justify a court in setting aside the action of the Office. Having in mind that the writ of mandamus is equitable in character, that it issues for preventing instead of promoting injustice (*Duncan Townsite Co.* v. *Lane*, 245 U. S. 308), we have no hesitancy in ruling that the judgment of the court below was correct, and it is therefore affirmed.

Affirmed.

MR. JUSTICE STEPHENS dissents.

Judge Groner took no part in the consideration or decision of this case.

District Court of the United States for the District of Columbia

STANDARD OIL CO. (INDIANA) *v.* PURE OIL CO. ET AL.

No. 63,123. Decided June 21, 1937

1. EQUITY SUIT UNDER 4915 R. S.—JURISDICTION OF DISTRICT COURT FOR THE DISTRICT OF COLUMBIA—CODEFENDANTS HAVING DIVERSE RESIDENCES.

Act of March 3, 1927 (35 U. S. C. 72*a*) *Held* not to confer on District Court for the District of Columbia jurisdiction of suit under section 4915 R. S. by interfering party against applicant for patent and his assignee, having diverse residences, since the applicant having parted with his entire interest is at most a formal party, not even a party with a separable interest.

2. SAME—SAME—JOINT MOTION TO DISMISS BY CODEFENDANTS—EFFECT OF.

Action of codefendants in jointly moving to dismiss bill for lack of jurisdiction *Held* not to constitute a general appearance.

In Equity. Suit by the Standard oil Company (Indiana) against the Pure Oil Company and another. On defendants' motion to dismiss the bill.

Motion sustained.

Edward B. Beale, of Washington, D. C., for plaintiff.

Edward H. Lang, of Chicago, Ill., and *Henry C. Parker*, of Washington, D. C., for defendants.

BAILEY, *A. J.*:

The plaintiff, as assignee of a joint application for Letters Patent filed in the name of Frederick W. Sullivan, Jr., and Robert F. Ruthruff, has brought suit by a bill in equity against the defendant, the Pure Oil Company (assignee) and the defendant Cary R. Wagner (assignor), of a patent application of said defendant Wagner. An interference entitled *Wagner* v. *Sullivan and Ruthruff* was declared between the said inventors by the Patent Office. After the taking of testimony, an interference decision within the Patent Office was rendered by the Examiner of Interferences, who awarded priority of invention to the inventor Wagner. The Board of Appeals of the United States Patent Office, acting upon an appeal taken by Sullivan and Ruthruff, rendered a decision affirming the Examiner of Interferences and awarded priority to the inventor Wagner. No appeal was taken by the inventors Sullivan and Ruthruff to the United States Court of Customs and Patent Appeals. Instead, plaintiff has elected to file this bill in equity under the provisions of R. S. § 4915 (as amended, 35 U. S. C. A. § 63), naming as defendant, Cary R. Wagner, the inventor-assignor, a resident of the State of Illinois and as codefendant the Pure Oil Company, a corporation of the State of Ohio, assignee of the patent application of Cary R. Wagner. Upon the filing of plaintiff's bill, the defendants jointly filed a motion to dismiss plaintiff's bill upon the grounds:

1. That neither of the codefendants is a resident of the District of Columbia, and therefore that neither defendant is subject to process issuing from this court.
2. That the defendant, the Pure Oil Company, is the only "necessary defendant" in this cause and that the Pure Oil Company is not a "resident" of the District of Columbia.
3. That the plaintiff has filed another suit in the United States District Court for the Southern District of Ohio, and that plaintiff should not be permitted to maintain two suits in different jurisdictions.

[1] The jurisdiction of this court is, if it has jurisdiction of this suit, based upon the act of March 3, 1927, 35 U. S. C. A. 72*a*, which is as follows:

§ 72*a*. *Jurisdiction of Supreme Court of District of Columbia in certain equity suits where adverse parties reside elsewhere; plurality of districts; service of writs.* Upon the filing of a bill in the Supreme Court of the District of Columbia wherein remedy is sought under section 63 or section 66 of this title, without seeking other remedy, if it shall appear that there is an adverse party residing in a foreign country, or adverse parties residing in a plurality of districts not embraced within the same State, the court shall have jurisdiction thereof and writs shall, unless the adverse party or parties voluntarily make appearance, be issued against all of the adverse parties with the force and effect and in the manner set forth in section 113 of title 28; provided that writs issued against parties residing in foreign countries pursuant to this section may be served by publication or otherwise as the court shall direct. (Mar. 3, 1927, c. 364, 44 Stat. 1394.)

I agree with the opinion of the Circuit Court of Appeals of the Second Circuit in *Hazeltine Corporation* v. *White et al.*, 68 F.(2d) 715, 717, where, in stating the purpose of Congress in passing this act, it said:

"The difficulty which formerly prevailed, because indispensable parties might be beyond the reach of process issuing out of any court in which the action could be brought and might be unwilling to appear voluntarily, has been obviated by the passage in 1927 of act March 3, 1927, 44 Stat. 1394 (35 U. S. C. A. § 72*a*), under which suits are now pending between these parties in the Supreme Court of the District of Columbia."

So far as appears from the bill, the defendant-assignor has parted with all his interest with the result that he is at most a formal party, not even a party with a separable interest.

The plaintiff claims that the assignor is an indispensable party for the reason that his signature must be subscribed to the affidavits known as preliminary statements or if the assignee wishes to abandon or disclaim or concede priority the signature of the inventor must be affixed to the document.

Apart from the fact that it is by no means clear that the participation of the inventor is necessary for these purposes, it does not appear that he must be a party to the interference nor does the bill claim that the inventor wishes to abandon or disclaim or concede priority. Rule 5 of the Patent Office provides:

"The assignee of the entire interest of an invention is entitled to hold correspondence with the office to the exclusion of the inventor."

As said above, so far as appears from the allegations of the bill, the defendant-assignor has parted with his entire interest and will in no way be affected by the result of this suit. To hold that the plaintiff by making a mere formal party a codefendant can compel the real defendant, the real party in interest, to come from any part of the United States and defend his rights in the District of Columbia would conflict with the general purpose of Congress as appears from the fact that ordinarily suits in the Federal courts must be brought in the district in which the defendant resides. Jud. Code, § 51, as amended, 28 U. S. C. A. § 112.

That an assignor is merely a formal party and not a real party in interest is also shown by the fact that this suit is brought by an assignee without the joinder of the assignor, a practice which is authorized by Equity Rule 13 of this court, which is taken from Equity Rule 37 promulgated by the Supreme Court (28 U. S. C. A. following section 723).

Plaintiff relies upon the case of *Martindale et al.* v. *Robertson et al.*, Eq. No. 49174.[1] In that case the defendants, assignor and assignee, were both residents of Massachusetts, and the other defendant was the Commissioner of Patents. As the defendants, assignor and assignee, were both residents of the same State, the question whether the joinder of the defendant-assignor would give this court jurisdiction was not involved.

I see no logical ground for holding a suit of this kind is a proceeding in rem. If it were, the amendment of March 3, 1927, 35 U. S. C. A. § 72*a*, would have been unnecessary and would have provided for a procedure more consonant with a proceeding in rem.

[2] Plaintiff also claims that because the defendants have jointly moved to dismiss the bill for lack of jurisdiction, they have appeared generally, but this is without merit. *Davidson Bros. Marble Co.* v. *Gibson*, 213 U. S. 10, 29 S. Ct. 324, 53 L. Ed. 675; *Georg Jensen Handmade Silver, Inc.*, v. *Georg Jensens Sluvmedie A/S et al.*, 65 D. C. App. 17, 79 F.(2d) 142.

Inasmuch as in my opinion the words "without seeking other remedy" apply to "other remedy" sought in the same suit, it is unnecessary to consider the question whether the defense of former suit pending can be raised by a motion to dismiss, when the facts do not appear on the face of the bill, and in view of the opinion of the Supreme Court of the United States in *Bernard Joseph Mumm* v. *Jacob E. Decker & Sons*, 57 S. Ct. 675, 81 L. Ed. —, decided April 26, 1937, it would not be necessary for the plaintiff to deny in the bill that it was not seeking other remedy, a bill in the "short form" being sufficient.

The motion to dismiss will be sustained.

[1] No opinion for publication.

U. S. Court of Customs and Patent Appeals

THE EMERSON ELECTRIC MANUFACTURING CO. *v.* EMERSON RADIO & PHONOGRAPH CORPORATION

No. 3,779. Decided April 5, 1937

[89 F.(2d) 349]

TRADE-MARKS—LIKELIHOOD OF CONFUSION—RIGHT TO REGISTER.

Record reviewed and *Held* the prior use by appellant of the name "Emerson" and of that name in connection with certain other features, on a long line of electric apparatus was not a bar to the registration by appellee of a mark for radio apparatus consisting of the representation of treble clef together with the words "Emerson Radio and Television", the last two words being disclaimed, where appellant did not enter the field of radios and phonographs until long after appellee, and no real confusion had been shown.

APPEAL from the Patent Office. Affirmed.

Mr. Lawrence C. Kingsland, *Mr. Edmund C. Rogers*, and *Mr. Estill E. Ezell* for The Emerson Manufacturing Co.

Messrs. Darby & Darby, *Mr. Samuel E. Darby, Jr.*, and *Mr. Louis D. Fletcher* for Emerson Radio & Phonograph Corporation.

GRAHAM, *P. J.*:

Emerson Radio & Phonograph Corporation, a corporation of the State of New York, applied to the United States Patent Office for the registration of a trade-mark for radio sets and apparatus, television sets and apparatus, etc., on September 12, 1933. It is said in the application that this mark has been used in connection with the selling of radio sets and apparatus, television sets and apparatus, radio television sets and apparatus, and radio phonograph combinations, since about July 1, 1927.

The mark consists of a representation of a treble clef, together with the words "Emerson Radio and

Television." No claim is made to the words "Radio and Television" apart from the mark, as shown. The words are superimposed upon the lower part of the clef.

The Emerson Electric Manufacturing Company, a corporation of the State of Missouri, filed notice of opposition to the application, alleging that it is the manufacturer of electrical equipment, including, among other items, the following:

Electric motors, electric fans, including portable, wall, ceiling, floor, and exhaust types, furnace blowers, forge blowers, organ blowers, and hair driers, electric generators, electric motor-generators, electric switches, including manually operated and automatically controlled types, rotary transformers, illuminating cylinders, electrically operated coffee mills, electrically operated air and water pumps, electrically operated lathes, electrically operated buffers and grinders, electrically operated dental engines, electric power units for sewing machines, electrically operated humidifiers, electrically operated air washers, and radio "B" power units.

The opposer states that since in or about 1890, its business has been conducted under the present or substantially the same name, including prominently the word "Emerson" as its distinctive feature; that its products have been marketed with and known by the name "Emerson", and have been extensively advertised; that this name has been used continuously since its initiation; and that it has built up a valuable good will.

The opposer also states that it is the owner of three registered trade-marks, namely, a trade-mark consisting of the block letters "EMERSON", registered August 15, 1916, for the following:

"• • • electric motors, electric fans, including fans of portable, wall, ceiling, and floor types, electric exhaust-fans, electric forge-blowers, electric generators, electric motor-generators, knife-switches, switchboards, panel-boards, fuse-boards, transformers, rotary transformers, illuminating-cylinders, watch-demagnetizers, electric organ-blowers, electric hair driers, electrically-operated coffee-mills, electrically-operated air and water pumps, electrically-operated lathes, electrically-operated buffers and grinders, electrically-operated furnace blowers, electrically-operated hacksaws, and electric motors and power-transmitters for sewing-machines, in Class 21, Electrical apparatus, machines, and supplies";

a trade-mark consisting of the word "Emerson", registered September 5, 1916,

"for dental lathes, dental engines, and buffers and grinders for dentists' use, • • • Dental, medical, and surgical appliances."

Both of the foregoing trade-marks were registered under the ten year clause of the Trade-Mark Act of 1905. Ownership is also pleaded of a trade-mark consisting of a representation of a pyramid, with the words

"Fans
EMERSON
Motors
Built to Last",

registered June 9, 1925,

"for nonoscillating electric fans, oscillating electric fans, electric ceiling fans, electric column fans, electric ventilating fans, electric exhaust fans, and electric motors."

The ordinary allegations of confusion in origin are made.

The parties took testimony. The appellant, on its part, showed that the scope of the distribution of its products was nation-wide and had been such for a long period; that distribution was initiated in 1900 and extended to 1905; that extensive advertising had been carried on; that the mark "Emerson" for dental, medical, and surgical appliances had been used continuously since 1924, the same name plate having been used on generators, fans, and electrical appliances; that the same name plates were used in motor generator sets for use with radio in 1921. From 1921, motors have been produced which have a name plate bearing the word "Emerson" prominently displayed thereon. Motors have been supplied for use with television apparatus, showing the word "Emerson" prominently displayed. This was about 1929.

The major part of the company's business is electric fans, distributed at retail through outlets which handle both radio and phonograph apparatus. Herbert I. Finch, a witness, testified that during the last two years quite frequently correspondence has been miscarried between the two companies, to the number of, perhaps, fifteen or twenty letters.

On cross-examination, the witness Finch testified that the special dynamotor for radio apparatus which he had mentioned in his testimony was a special dynamotor for radio work, and is the same as was referred to as the "Emerson 'B' Power Unit." These were sold directly to the consumer, and were used in place of the ordinary "B" batteries or vibrators. This power unit was placed upon the market first in 1932. The company has not patented this product, and does not manufacture complete television sets, or complete radio television receiving sets, or radio tubes. In addition to the dynamotor, the company has manufactured high voltage generators formerly used in transmission work, and motors for driving parts of radio and television apparatus. The witness was of the opinion that the use of the products of both the appellant and appellee under the mark "Emerson" would be confusing.

Emerson Radio & Phonograph Corporation, the appellee, filed an answer, alleging that the so-called radio "B" power units were not manufactured until long after the appellee had manufactured and sold its goods, bearing its aforesaid mark, and that the appellant did not at any time prior to appellee's entry into the field sell or offer any radio parts or radio products of any kind; that the appellee has established an extensive good will, and that the various products which it manufactures are recognized by its name, which is associated with the appellee. The applicant denies that the goods manufactured by the opposer are of the same descriptive properties as those of the applicant, and denies any interference or confusion with the mark used by the applicant. The applicant claims to be the owner of five trade-mark registrations, namely, a mark consisting of the written signature, "Victor H. Emerson", registered January 25, 1916, for use with phonographic machines and sound records; a mark consisting of a representation of a treble clef, registered May 25, 1920, for use with the sale of musical instruments and supplies; a mark consisting of a representation of a shield with the word "Emerson", registered April 6, 1920, in connection with the sale of phonograph records; a representation of a treble clef, superimposed upon the words "Emerson Records", registered May 30, 1922, in connection with the sale of phonographs and phonograph records; and a trade-mark consisting of a representation of a treble clef with the words "Emerson Phonoradio", registered May 29, 1927, in connection with the sale of complete radio receiving sets adapted to combination with phonographs.

It appears from the testimony of the witness Benjamin Abrams, who is the president of the Emerson Radio & Phonograph Corporation, that he has been connected with the sale of products under the name "Emerson" since 1916. In 1916 Abrams was associated with the company as jobber of Emerson phonographs and records. These records were at first sold with the trade-mark "Victor H. Emerson", and about a year after the business was started a trade-mark showing a clef and accompanied with the words "Emerson Records", was substituted.

At that time approximately six advertisements issued of various phonographs sold by the company, by which they were made known to the public. Among other advertisements at the time was one of January 10, 1920, in the Saturday Evening Post. Sometime in 1921, the Emerson company went into the hands of a receiver, and, in 1922, the company went into bankruptcy and the assets of the company were offered for sale. Abrams then purchased the assets, including the trade-marks, patents, good will, machinery, equipment, and inventory, with the exception of one patent, which were included within the company's property. Thereupon Abrams caused a new corporation to be formed, known as the Emerson Phonograph Company, Inc., to which was at once transferred all the assets which had been acquired by Abrams from the Emerson Phonograph Company, Inc. This new company engaged in the business of manufacturing phonographs and phonograph records. In 1923 the company initiated the manufacture and sale of a combination radio and phonograph, which was called the Emerson Phonoradio. This machine was extensively advertised in trade and other magazines. In 1922 Abrams made arrangements with a company in Peru, Indiana, under the name of Wasmuth-Goodrich Company, whereby Emerson Phonograph Company, Inc., granted to Wasmuth-Goodrich Company the right to manufacture a phonograph and use the Emerson name thereon. In 1923 it was decided by the Emerson Phonograph Company, Inc., to manufacture a combination radio and phonograph, using the phonograph that Wasmuth-Goodrich Company manufactured, and attaching thereto, in the place of business of the Emerson Phonograph Company, Inc., a radio set, thereby forming a combination radio and phonograph. At that time the Emerson Phonograph Company, Inc., found that an application was also pending from Wasmuth-Goodrich Company in the Patent Office, to register the name "Emerson" for a combination phonograph and radio. Opposition proceedings were started, and finally the proceedings resulted in a settlement whereby the Emerson Phonograph Company, Inc., acquired the rights claimed by Wasmuth-Goodrich Company. The trade-mark was assigned and transferred to Emerson Phonograph Company, Inc.

In 1924 the Emerson Radio Corporation and the Emerson Phonograph Company, Inc., merged under the name of Emerson Radio & Phonograph Corporation. The former corporation was formed for the purpose of segregating the phonograph business from the radio business. After the separate corporations were formed, it was decided by the companies to abandon the plan of operating two separate units, because of overhead and other reasons. Emerson Radio & Phonograph Corporation, since its organization, has been engaged in the business of manufacturing and selling radios, with a small percentage of phonograph business. Many of its products have been marketed with the treble clef as a trade-mark associated with the name "Emerson." The advertising of the company amounts to as much as $100,000 a year, and its goods have been extensively advertised throughout the country. The mark has been continued upon all of its products, and at the time of hearing approximately 12,000 dealers were engaged in the selling of these products, in ten or twelve countries. Mr. Abrams stated that in his knowledge of the business he had never known of any confusion in mail, or otherwise, between the two contesting companies. The products are sold in music, radio, hardware, and automotive stores, and, in some cases, drug, department, and furniture stores. The company sells only repair parts for the instruments it also sells, and does not make a business of manufacturing parts. The parts are largely purchased from other manufacturers.

The Examiner of Interferences was of the opinion that the opposition should be sustained and that the registration ought not to be allowed. On appeal, the Commissioner of Patents reversed the decision of the Examiner.

The principal controversy in this case arises out of the date when the parties entered the particular field in which the appellee is now engaged, namely, the manufacture of radios and phonographs. The opposer, by its testimony, attempts to prove that it was in this field at least as early as the appellee. This the appellee denies. Both parties took testimony. The Commissioner of Patents made these observations upon the point at issue:

It seems to me the goods involved in the instant proceeding are as different as were those disclosed in either of the cited cases. It is to be noted that applicant's description of goods is quite specific, and that the only "parts" of its various receiving sets to which its mark is applied are tubes, eliminators and loud speakers. Probably opposer's "radio 'B' power units" could properly be called radio parts, though the record is somewhat hazy in that regard; but it is fairly apparent that their manufacture was only temporary, that it occurred after applicant's established use of its mark on the goods described in the application, and that it had been permanently discontinued before the application was filed. It follows that with respect to this particular item opposer's trade-mark was not "owned and in use" by it so as to prevent registration to applicant under the provisions of Section 5 of the Trade-Mark Act, even though it be assumed that the goods were of the same class as those of applicant.

Counsel for appellant contend that radio parts were made by it before the appellee engaged in the

general making of radio parts. The testimony of the witnesses shows that, in a circular issued by the appellant in 1922, a motor generator adapted for radio work was advertised for sale. We have examined the circular with some care, and find an illustration of such a motor. However, there is no statement that this motor generator is not suitable for other purposes, and in so far as its appearance is concerned, it might well be used for other purposes. It does not appear that the appellant engaged in the making of any apparatus, especially adapted to and suitable for radio purposes, until 1930, when fans, with radio speakers attached, were offered for sale in the catalogs of the appellant. On one occasion, in January, 1924, the appellant offered for sale what was called "Gabels Automatic Entertainer," a sort of a music box, similar to a phonograph.

The real production of radio power units by the appellant began about 1932, and consisted of sales of special dynamotors which were used in lieu of "B" batteries or vibrators, in conjunction with small independent units of electric energy production. The testimony shows that the appellant has never been actively engaged in the production of radio receiving sets, or in any radio parts, except such production as has been mentioned in radio dynamotors.

This production was entered upon at a time long succeeding the entrance of the appellee into the field. Since 1924 it had been continuously and increasingly producing radio receiving sets, until its reputation and business had largely increased along these lines.

These corporations have been following their chosen lines for many years, without apparent conflict. A few letters have miscarried in the mails or have been misdirected, but such confusion seems to have been without serious consequences. Both parties have honestly built up valuable and extensive businesses. There seems to be no reason why they should not be permitted to continue to do so and to use the marks which have become familiar to the users of their goods.

The particular trade-mark which the appellee is attempting to register at this time is distinctive. The mark consists of several features, a striking feature of which seems to be the representation of a treble clef associated with the word "Emerson". The appellee entered the radio field first, and, considering the character of the goods of the respective parties at that time, no good reason appears why it should not be permitted to register its mark.

We observe that the mark sought to be registered contains the words "Radio and Television", which are disclaimed. We fail to find in the record any statement that the appellee is engaged in the sale or manufacture of television equipment. It is suggested to the Commissioner of Patents that it may be necessary to cause this application to be so amended as to omit the word "Television" on the return of the case to the Patent Office.

In our opinion the Commissioner of Patents came to the right conclusion, and his decision is affirmed.

U. S. Court of Customs and Patent Appeals

HAGEN *v.* CORDS

No. 3,795. Decided April 5, 1937

[88 F.(2d) 998]

INTERFERENCE—PRIORITY.

Record reviewed and *Held* that the issue of the interference is properly readable upon the disclosure of an earlier application of C., the filing date of which was prior to any date claimed by H., and that priority was properly awarded to C.

APPEAL from the Patent Office. Affirmed.

Mr. Henry E. Stauffer for Hagen.

Messrs. Strauch & Hoffman and *Mr. Ralph L. Stevens* for Cords.

BLAND, *J.:*

Appellant, Rudolf A. Hagen, has here appealed from the decision of the Board of Appeals of the United States Patent Office, affirming that of the Examiner of Interferences in awarding priority of invention in the subject matter of the single count at issue to the appellee Cords.

The interference involves the application of Hagen, filed September 6, 1932, and the application of Cords, filed April 22, 1932, as a continuation in part of his parent application filed February 4, 1931.

The count reads as follows:

In combination with means providing an annular packing ring groove, a set of light resilient rings of dished form snugly disposed in said groove but remaining in dished form therein, each ring consisting of at least one substantially complete convolution of thin ribbon-like metal, certain convolutions of the set of rings being arranged with their dished faces in opposition to the corresponding faces of certain other convolutions of the set, whereby the assembled packing when viewed in cross section has the appearance of several laterally engaged V-shaped sections the crotches of which are located in alignment adjacent the open edge of the groove.

The invention relates to piston rings. A complete ring consists of a set of two, four, six or more segments or elements, in pairs, which are made by bending them into circular shape from a thin, flat, light, oil-tempered steel ribbon. The ring is bent while cold on lines transverse to the width of the ribbon. The bending operation is so performed that a definite dish or cup shape is imparted to the ring segments—a frustro-conical shape. The rings are placed in the piston groove in such manner as to have two or more of the segments having the dished faces in opposition so as to form V-shaped channels or clearances. In reducing the diameter of the ring segments in applying them to the piston or in placing the piston in a cylinder, the segments take on a greater degree of dishing and, necessarily, upon pressure, fit more tightly upon the inner surface of the groove in the piston head. The invention is urged as being of great importance in the repair of worn automobile engines.

Appellant's three reasons of appeal upon which he relies are as follows:

1. The Board of Appeals erred in holding that the Cords early or parent application, Serial No. 513,440, filed February 4, 1931 (now patent No. 1,919,584), which has been used as the basis of the award of priority, supports the issue.

3. The Board of Appeals erred in construing the so-called "whereby" clause of the single count of the issue so as to inject thereinto an idea of structure not justified by the elements recited.

4. The Board of Appeals erred in holding that the word "snugly", as used in the issue of the interference to define the character of the fit of the rings in the grooves of the piston, found response in the Cords early application, No. 513,440, after holding that the disclosure of that application required a definite clearance of at least five one thousandths (.005) of an inch of said rings in their grooves.

We are of the opinion that the sole question presented here for decision, which we may consider, is the correctness of the action of the Board of Appeals in affirming the holding of the Examiner of Interferences that the subject matter of the count was disclosed in Cords' parent application.

Cords' parent application bears a date long prior to any date claimed by appellee either for conception or reduction to practice, and the controlling question in awarding priority involves the right of Cords to make the count. Appellant's first reason of appeal raises this question. The question raised by the fourth reason of appeal is involved in the decision of the first reason. The third reason of appeal, involves the consideration of patentability with which we are not here concerned. The Board's discussion of the "whereby" clause seems to have been with a view of distinguishing the count from the prior art and had nothing to do with the question of whether or not Cords' parent application disclosed the elements of the count at bar. We will, therefore, give no further consideration to the third reason of appeal.

Appellant's contention that the count does not read upon the parent application of Cords is predicated upon the proposition that the structure of Cords as disclosed in his parent application did not show rings which were "snugly disposed in said groove." Appellant states that the parent application as filed contained a statement that "The grooves are preferably filled with rings, a clearance of .005" being maintained in the groove," and points out that the Patent Office tribunals, in an interference proceeding with which we are not here concerned, held that the said Cords application definitely required a clearance of .005 inches between the sides of the ring and the sides of the groove in which the ring was placed, and argues that since the Patent Office had held in the earlier interference that a clearance of that amount was required, it was inconsistent for the Examiner of Interferences and the Board in this case to hold that Cords' said application disclosed that the rings were snugly disposed in the groove. This particular phase of the question is stressed here at considerable length. In fact it is the only point stressed by appellant, except the matter involving the "whereby" clause to which we have hereinbefore referred.

After the Board had affirmed the Examiner of Interferences on January 17, 1936, appellant filed a petition to rehear or amplify its decision, and on February 27, 1936, the Board, without a rehearing, "amplified" its former decision, adhered to its views formerly expressed, held that the count read upon the disclosure in Cords' parent application, and affirmed the award of priority in the issue of the count to the party Cords.

Concerning the question here involved, the Board said:

The only question properly before us on that appeal was the right of Corda to rely on his earlier application, 513,440, to support the count and such matters as were more or less directly related to this question. The Hagen brief, in arguing this point, stressed an alleged similiarity between the count and a claim held in our former decision to be unpatentable. In making this comparison, the party Hagen assumed that there had also been a holding that the claim to which the present count was compared was not supported by the earlier Cords application but as we pointed out, and as Hagen now concedes, there was no such holding. In passing on this holding, we disposed in the main of the contention on which Hagen's appeal was based.

There is some discussion in the Hagen brief of the term "snugly", which appears in the count, but not in the claim to which the count was compared. Certain claims which have previously been held not to be supported by the earlier Cords application required that the assemblage of rings be so related to the dimensions of the groove in which they were placed that such assemblage would be compressed or deformed in order to completely fill the grooves. In our decision on these claims, we held that the earlier Cords application did not support claims involving assemblage in this particular manner. If the word "snugly" in the present issue requires actual deformation or a fit in the groove without clearance, it is obviously not supported by the earlier application because there is a definite statement therein that a certain amount of clearance is provided for. It seems to us, however, that the term in question required nothing more than that the rings substantially fill the groove, whether there be slight clearance or not. In our opinion, the earlier application supports the count and the later application as well.

It is a well-settled rule in patent interferences where the question of interpretation of counts is involved, that the counts will be given as broad a construction as their language will reasonably permit. It seems to us that the appellant has asked, to say the least, a very narrow construction of the count. But, we believe that under any reasonable construction of the count, its elements were disclosed in Cords' parent application. It seems obvious that the flexibilities of the rings, the manner of their construction, and the manner in which Cords shows that they were to be placed into the grooves, suggests that they, we may say, were to *nestle* into the groove snugly. We find no definition of the word "snugly" given by any of the authorities which indicates that that term may be applied only to a very tight fit. The degree of tightness intended to be conveyed by the word "snugly" must necessarily depend on the connection in which it is used. What would be snug in one instance might be very loose in another. Cords in his parent application clearly taught the filling of the grooves, and we think he showed a filling of the grooves and a snug disposition of the rings notwithstanding the fact that there might be .005 inches clearance behind the rings. The fitting with which Cords was concerned was not that character of fitting which required air-tightness, or a precision ofttimes required in fitting many different journals and bearings connected with an automobile. We think the term "snugly" may be applied to Cords' parent disclosure appropriately as indicating that the rings would have to be so placed as to avoid large undesirable clearances which would defeat the purposes of the invention.

It follows that the decision of the Examiner of Interferences, holding that the count reads upon

appellee's original disclosure, and awarding priority of invention therein to the appellee, was not erroneous, and that the Board's decision affirming that of the Examiner of Interferences was correct. The Board's decision is affirmed.

Affirmed.

HATFIELD, *J.*, did not participate in this decision.

U. S. Court of Customs and Patent Appeals

IN RE CHARMAN

No. 3,785. Decided May 3, 1937

[89 F.(2d) 667]

PATENTABILITY—INGOT MOLD ASSEMBLY.

Claims for an ingot mold assembly including a compressible sealing layer of cellular fibrous material *Held* unpatentable over the prior art and other claims which specify that the sealing layer is "combustible under temperature conditions existing during the teeming of an ingot" *Held* patentable.

APPEAL from the Patent Office. Modified.

LENROOT, *J.*, dissenting as to claims 12 to 17.

Messrs. Kwis, Hudson & Kent, Mr. A. J. Hudson, and *Mr. S. J. Boughton* and *Mr. Joseph W. Milburn* for Charman.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

HATFIELD, *J.*:

This is an appeal from the decision of the Board of Appeals of the United States Patent Office affirming the decision of the Primary Examiner rejecting claims Nos. 12 to 17, inclusive, and 19 to 24, inclusive, in appellant's application for a patent for an alleged invention relating to "Improvement in Bottom Ring for Hot Tops."

Several claims were allowed. Of the rejected claims, Nos. 13 and 19 are illustrative. They read:

13. The herein described ingot mold assembly comprising upper and lower ingot mold elements matching horizontally to form a continuous mold cavity a substantial portion of which is within the lower mold element, and a compressible sealing layer of corrugated board combustible under temperature conditions existing during the teeming of an ingot lying horizontally between the adjacent surfaces of the lower and upper mold elements.

19. The herein described ingot mold assembly comprising upper and lower ingot mold elements matching horizontally to form a continuous mold cavity a substantial portion of which is within the lower mold element, and a highly compressible sealing layer of cellular fibrous material lying horizontally between the adjacent surfaces of the lower and upper mold elements.

The references are: Adams, 1,457,763, June 5, 1923; Ramage et al., 1,813,508, July 7, 1931; Messler et al., 1,893,206, Jan. 3, 1933; Messler et al., 1,893,207, Jan. 3, 1933.

In its decision the Board of Appeals said:

Claims 12 to 17, inclusive, are copies of claims 1 to 6, inclusive, of the patent to Messler et al., No. 1,893,206. The instant application was involved in Interference No. 66,227 with the patent to Messler et al., No. 1,893,207. In that interference Charman moved the admission of his claims 12 to 17 for interference with Patent No. 1,893,206. This motion was denied by the Examiner of Interferences and on Charman's appeal the Examiner's decision was affirmed by this Board.

The denial of Charman's right to make these claims of Patent No. 1,893,206 was based on the holding that the Charman application does not fairly disclose a sealing layer made of material which is combustible under temperature conditions existing during the teeming of an ingot.

It may here be said that Interference No. 66,227, referred to by the Board, was decided by that tribunal and appealed to this court, Charman being the appellee therein. That interference involved but one count, which was claim 18 of appellant's application and claim 2 of the patent to Messler et al., No. 1,893,207. On motion of Charman, the appeal was dismissed on May 4, 1936, because of appellant's failure to prosecute.

Claims 19 to 24 differ from claims 12 to 17 in that they do not contain the limitation that the sealing layer of cellular fibrous material is "combustible under temperature conditions existing during the teeming of an ingot."

Appellant's specification states that the invention has particular reference to "improvements in non-floating hot tops of that class in which metal castings are employed"; that the hot top rests upon the ingot mold during the pouring operation; that the joint between the casing and the hot top must be relatively tight in order to prevent molten metal from entering it; that solidification of molten metal in the joint

"tends to 'hang up' the ingot thereby interfering with its natural shrinkage during cooling, and serves to weld the two surfaces together."

After a description of the upper surface of the ingot and lower end surface of the hot top, the specification states that one of the objects of the invention is to provide a

"yieldable pad or gasket between the hot top casing and ingot mold in order to effect a good seal for this joint, and preferably an extension of this pad or gasket inwardly and upwardly to constitute a lining for a portion of the hot top as a protection for the inner wall thereof."

Figure 2 of appellant's drawings is a vertical section view of a hot top in which the gasket referred to is shown. In his specification appellant describes the gasket, designated by the numeral 19, as "non-inflammable," and states that—

By the term "non-inflammable" as herein applied to the member 19 I intend to include any material which will *not* burn or which will burn *with difficulty*, fibrous material being preferred.

This material should also be somewhat resilient or yielding * * *. [Italics ours.]

It will be noted that in the group of claims under discussion—12 to 17—the sealing layer or gasket is composed of a material "*combustible* under temperature conditions existing during the teeming of an ingot." [Italics ours.]

In claims 13, 14, and 16 the material specified is "corrugated board." In claims 12, 15, and 17 it is referred to as "cellular fibrous material."

During the *ex parte* prosecution of this case, appellant filed affidavits respecting tests made by one Lemmerman, a chemical research engineer, in an effort to show that the decisions in the interference case were based upon an erroneous assumption as to the combustibility of appellant's gasket.

It is stated in the affidavit of Mr. Lemmerman that he conducted certain experiments or tests for the purpose of discovering what, if any, differences would appear in the operation of a mold and hot top "with a gasket of ordinary corrugated board interposed between the hot top and mold," a "gasket of fire-proofed corrugated board," and a "gasket of

corrugated asbestos board"; that in making the tests the affiant

"used apparatus and conditions simulating, as nearly as it is possible to do in a laboratory, actual working conditions";

that he found that the

"effect of molten metal upon gaskets in an assembly of mold and hot top would be essentially the same whether the gasket was made from ordinary *untreated corrugated board* or from the same type of corrugated board treated with a fire-proofing agent, in other words deponent found that the corrugated board in each instance was destroyed for approximately the same distance back from the joint exposed to the molten metal";

that the

"destruction or disintegration of the asbestos corrugated board at the temperature of molten metal was approximately the same as that of the ordinary untreated or treated corrugated board";

that the apparatus used by him in making the tests consisted of

"two steel plates or bars two and one-half inches thick by four and one-half inches wide and twenty-four inches long, which plates were drawn together by means of bolts and nuts until the corrugations were partly crushed, a degree of compression approximately equal to that which would obtain under actual working conditions."

Affiant further stated that by his experiments he determined

"that corrugated board is inflammable, that is when ignited it burns freely with a flame, that corrugated board thoroughly treated with trisodium phosphate, as were the samples which he employed in the said tests, is a material which is not inflammable, that is to say it will not burn with a flame even though there be plenty of air to support combustion, that it is a material which is difficult to destroy by combustion although it may be so destroyed slowly or by the continued application of a hot flame, as for instance an air and gas torch flame; * * * that untreated and fire-proofed board of the same physical character, when not subjected to flame, char at the same temperature, that is to say about 500° F.; and that asbestos corrugated board does not begin to char until subjected to a temperature of around 1100° F.; but that all three of these materials when subjected to the temperature of molten iron or steel, that is about 2600° F., char and disintegrate at about the same rate." [Italics ours.]

It was the view of the Patent Office tribunals in the interference proceeding, as stated by the Board of Appeals in the quoted excerpt from its decision, that appellant's application, as originally filed, could not reasonably be said to teach the use of a material "combustible under temperature conditions existing during the teeming of an ingot."

The Primary Examiner discussed the issues in the case at considerable length, and, among other things, stated that appellant's application discloses a non-inflammable annular gasket; that appellant stated in his application, as originally filed, that he intended to use a non-inflammable material somewhat resilient or yielding, "fibrous material being preferred"; that he stated that the term "non-inflammable" was intended to mean material which will not burn or which will burn with difficulty; that the only other references in appellant's application, as originally filed, to the material which he intended to use were in his original claims 8 and 9, wherein it was referred to as "a non-metallic non-inflammable strip"; that, at the time appellant's application was filed—January 28, 1931, the

"only cellular material taught by the art for this purpose was corrugated asbestos board—a well known non-inflammable material,"

and, since appellant did not mention any specific material in his application, it must be assumed that he intended to refer to material known to the art; that if he had discovered that "corrugated paper board *which was new to the art*" was satisfactory for "his purpose," he would have specifically disclosed it in his application so as to enable one skilled in the art to make use of it, in accordance with the provisions of section 4888, R. S. (U. S. C. Title 35, section 33); that as his application stressed the non-inflammable character of the material used as a gasket, appellant did not contemplate the use of ordinary corrugated board for that purpose, and, therefore, the "expression burn with difficulty" should be looked upon

"as an attempt to broaden the range of equivalents, a vague and prophetic expression which contempletely fails to satisfy Sec. 4888, R. S.";

that in view of the fact that appellant's application, as originally filed, was silent as to the temperature at which his gasket material would "burn with difficulty," the only reasonable interpretation of that phrase is that his gasket material would burn with difficulty "*at the temperature existing in the mold when the metal is poured*," and, accordingly, held that appellant's application did not contain an adequate disclosure to support appealed claims 12 to 17. [Italics quoted.]

In its decision, the Board of Appeals quoted the following from its prior decision in the interference case hereinbefore referred to:

The claims in the patent to Messler et al. No. 1,893,206 are limited to a construction in which the sealing layer of cellular fibrous material is combustible under temperature conditions existing during the teeming of an ingot. The patent specification states it is important that the material be combustible at the temperature existing in the ingot mold during pouring. The inner edge of the annular gasket member extends within the mold cavity and the patent states that the portion of the sealing material which extends into the mold cavity is decomposed by combustion or charring with relative rapidity and the material which lies compressed between the two mold elements is consumed relatively slowly. It further states that the patentees have found that even though the sealing material be of a highly combustible nature, the seal formed by it persists for a sufficient length of time to permit the ingot metal to cool below its temperature of high fluidity.

We do not believe that the Charman application as filed fairly disclosed this concept of using combustible material. The emphasis therein appears to be on the non-inflammable character of the material and while in one sentence it is stated that the material used will not burn or will burn with difficulty, we believe the intention was that the material should be substantially non-combustible. As pointed out by the examiner, the claims in the patent were allowed over the patent to Adams No. 1,457,763 disclosing a sealing member made of corrugated asbestos in view of their inclusion of the limitation as to combustibility * * *,

and affirmed the decision of the Primary Examiner holding that appellant's disclosure was not sufficient to support claims 12 to 17.

It is conceded by counsel for appellant that appellant's right to make claims 12 to 17 must be based primarily upon his disclosure. It is stated by counsel, however, that the purpose of the affidavits was to show that the tribunals of the Patent Office erred in holding that the expression "combustible under temperature conditions existing during the teeming of an ingot," contained in claims 12 to 17, excludes material "which will burn with difficulty"; that the affidavits clearly show that "at least one fibrous material which burns with difficulty is combustible at these high temperatures"; that appellant's application does not specify any particular material to be used as a gasket, and is, therefore, sufficiently broad "to include any yieldable fibrous material which burns with difficulty, such as,

for example, fire-proof corrugated board"; that appellant preferred a material so treated as to make it slow burning; that the tribunals of the Patent Office were in error in holding that the phrase "burn with difficulty" implied conditions of temperature prevailing during the teeming of an ingot; that it

"is generally recognized that in patent specifications, when no temperature is mentioned, ordinary atmospheric temperatures are intended. This is a well recognized rule particularly in chemical cases. While the present case is not strictly a chemical one, it comes within the field of metallurgy, which is a branch of chemistry, and it would seem should be subject to the rules of interpretation in chemical cases";

that it would be ridiculous to limit appellant's gasket material to such as would "burn with difficulty" under temperature conditions existing during the teeming of an ingot—about 2600° F., as any

"fibrous material that will burn at all will burn without difficulty at such an extremely high temperature as 2600° F. It is only at much lower temperatures that this expression could mean anything."

It is conceded by counsel for appellant that the term "non-inflammable" excludes ordinary corrugated board, and that there is nothing in appellant's application

"to indicate that he had any intention of using for a gasket, a material which would be freely combustible, that is to say combustible under ordinary conditions."

Counsel for appellant argue, however, that appellant did not intend to limit himself to a gasket material which would be non-combustible at the pouring temperature of molten metal.

It would seem to be clear that if counsel for appellant are correct in the position taken by them, that is, that, as no temperatures were mentioned in appellant's application, "ordinary atmospheric temperatures are intended," and that the phrase "burn with difficulty" must be so interpreted, then the same rule should apply to the phrase "which will not burn," and also to the term "non-inflammable." This, we think, is a wholly untenable proposition.

It is suggested by counsel for appellant that the limitation in the claims as to combustibility is not important and does not improve the action of the gasket. That may be so. The question before us, however, is whether the limitations in the appealed claims are disclosed in appellant's application. If they are, he is entitled to make the claims. If they are not, he is not entitled to make them. No authorities need be cited in support of that proposition.

Counsel for appellant further contend that the claims do not call for "ordinary corrugated board," nor "merely combustible material," but do call for "material [including 'treated corrugated board as well as ordinary corrugated board'] which is combustible at the temperature of 2600° F." (which temperature is referred to in the Lemmerman affidavit as about the temperature of molten iron or steel), and that the Board erred in holding that the language contained in the appealed claims—"combustible under temperature conditions existing during the teeming of an ingot"—was "equivalent to the term 'combustible' merely."

Although it appears from the decisions of the Primary Examiner and the Board of Appeals that in the interference proceeding it was held that appellant's application did not teach the use of a material "combustible under temperature conditions existing during the teeming of an ingot," the Primary Examiner, in the instant case, stated, as hereinbefore noted, that appellant's

"specification is entirely silent as to the temperature at which the material must burn with difficulty but the only reasonable interpretation is that it must burn with difficulty *at the temperature existing in the mold when the metal is poured.*" [Italics quoted.]

The Board of Appeals, in affirming the decision of the Primary Examiner, did not refer to that holding. It must be held, therefore, that it intended to affirm the Examiner therein.

It will be observed that, in his application, appellant specified that he contemplated the use of two kinds of somewhat resilient or yielding cellular fibrous material, namely, that which will not burn, and that which will burn with difficulty. By the term "burn with difficulty" we think it is clear, as stated by the Primary Examiner, that appellant intended to use a gasket material which would burn, although slowly and with difficulty, "*at the temperature existing in the mold when the metal is poured,*" that is to say, it would burn with difficulty under "temperature conditions existing during the teeming of an ingot." [Italics quoted.]

In its decision, the Board stated that the appealed claims

"are *limited* to a construction in which the sealing layer of cellular fibrous material is combustible under temperature conditions existing during the teeming of an ingot." [Italics ours.]

We are in agreement with that holding.

The Board further called attention to the fact that the patentees, Messler et al., stated in their specification that it was "important that the material be combustible at the temperature existing in the ingot mold during pouring." The Board also referred to the following statements contained in the patentees' specification:

It should be understood that when an ingot is teemed into the mold, the exclusion of air from the combustible sealing material by the ingot metal itself *prevents instantaneous combustion of the material,* but that on the contrary this *material will char;* the portion *of the sealing material which extends into the mold cavity being decomposed by combustion or charring with relative rapidity, and the material which lies compressed between the two mold elements being consumed relatively slowly.*
We have found that even though the sealing material be of a highly combustible nature, the seal formed by it persists for a sufficient length of time to permit the ingot metal to cool below its temperature of high fluidity. [Italics ours.]

It may be said at this point that the Primary Examiner held that the words "corrugated board" were intended by the patentees to refer to ordinary corrugated board, which, it may be said, is a highly combustible material.

Assuming that the phrases "corrugated board," contained in claims 13, 14, and 16, and "cellular fibrous material," contained in claims 12, 15, and 17, might be interpreted to mean a "highly combustible material," the claims, nevertheless, are clearly not so limited, but, on the contrary, call for a gasket material "combustible under temperature conditions existing during the teeming of an ingot."

We think it is clear from their specification that the patentees had in mind, and so taught, that that portion of their gasket material which extended into the mold cavity would become "decomposed by combustion or charring with relative rapidity"; whereas that portion of the gasket material "lying horizontally between the adjacent surfaces of the lower and upper mold elements," as stated in the claims under consideration, or, as stated in the specification, the "material which lies compressed between the two mold elements" would be "consumed *relatively slowly.*" [Italics ours.]

Reading appealed claims 12 to 17, therefore, in the light of the patentees' specification, as did the tribunals of the Patent Office, we think it is clear that they were not intended to be limited to a "highly combustible" gasket material "lying horizontally between the adjacent surfaces of the lower and upper mold elements," but were intended to include materials, which, lying in that position, although "consumed relatively slowly," are "combustible under temperature conditions existing during the teeming of an ingot."

But, even though the patentees' specification be ignored, it is clear, we think, that appellant's application, as originally filed, discloses a cellular fibrous gasket material, which, when "lying horizontally between the adjacent surfaces of the lower and upper mold elements," as called for by the appealed claims, will burn slowly and with difficulty "under temperature conditions existing during the teeming of an ingot." There is no other reasonable interpretation to be placed upon the language "burn with difficulty," contained in appellant's application.

As we understand the Examiner's decision, the tribunals of the Patent Office did not hold in the interference proceeding that a "substance difficult to burn was non-combustible," and we think it is obvious that a gasket material which burns with difficulty under temperature conditions existing during the teeming of an ingot is combustible under such temperature conditions. Accordingly, we are unable to hold that appellant's application, as originally filed, is insufficient to support appealed claims 12 to 17.

As hereinbefore noted, claims 19 to 24 differ from claims 12 to 17 in that they omit the phrase "combustible under temperature conditions existing during the teeming of an ingot." Those claims were held unpatentable by the Patent Office tribunals over the patent to Ramage et al., in view of the patent to Adams, or over Adams alone.

The patent to Adams relates to a method of casting ingots and a seal for ingot molds, and discloses gasket material made of corrugated asbestos paper—a cellular fibrous material. The paper is made into the form of tubes which are cut into rings.

The patent to Ramage et al. relates to an ingot mold, and discloses a gasket material of "sheet metal such as sheet steel, or of heavy paper or other non-refractory material."

It is the contention of counsel for appellant that the patent to Adams does not disclose a corrugated board lying horizontally between the adjacent surfaces of the lower and upper mold elements, as called for by the appealed claims now under consideration; that not only the corrugations, but also the "lining paper which holds the corrugations in position are placed on edge"; that the patentee "may have deemed it necessary to have his air spaces closed, and may have shown the vertical arrangement of the corrugations on that account."

It is true that the patentee Adams discloses the corrugations in his gasket material as being vertical, although he stated in his specification that they might run horizontally instead of vertically. Whether appellant's corrugations are horizontal in his gasket material, is not important here, as there is nothing in the claims under consideration which calls for a horizontal arrangement of the corrugations. Some of the claims, particularly 19 and 24, call for a "sealing layer of *cellular fibrous material* lying horizontally between the adjacent surfaces" of the lower and upper mold elements; whereas, 20, 21 and 23 call for a "sealing layer of *corrugated board*" lying horizontally between the adjacent surfaces of the lower and upper mold elements. [Italics ours.] Claim 22 merely refers to a "cellular fibrous material lying between the adjacent surfaces of the lower and upper mold elements."

It clearly appears that the gasket (f), in Fig. 1 of the drawings in the patent to Adams, is "lying horizontally between the adjacent surfaces of the lower and upper mold elements," although the corrugations therein appear to be in a vertical arrangement.

We are in accord, therefore, with the holding of the Board of Appeals that appealed claims 19 to 24 are not patentable over the references of record.

However, for the reasons hereinbefore stated, we are of opinion that the Board erred in holding that appellant's disclosure was insufficient to support claims 12 to 17, and that, therefore, he was not entitled to make them.

Accordingly, the decision of the Board of Appeals is modified, being reversed as to claims 12 to 17, and affirmed as to claims 19 to 24.

Modified.

LENROOT, *J.*, dissents, as to claims 12 to 17.

U. S. Court of Customs and Patent Appeals

IN RE WILLIAMS

No. 3,755. Decided May 3, 1937

[89 F.(2d) 674]

PATENTABILITY—PROCESS OF TREATING WOOD PULP.

Claims for a process of treating wood pulp for making sanitary pads *Held* unpatentable as defining no invention, in view of the prior art, over the claims of applicant's patent for the pad.

APPEAL from the Patent Office. Affirmed.

Messrs. Moses & Nolte, Mr. Albert C. Nolte, Mr. I. R. Paris, and *Mr. Clarence M. Crews* for Williams.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

HATFIELD, *J.:*

This is an appeal from the decision of the Board of Appeals of the United States Patent Office affirm-

ing the decision of the Primary Examiner rejecting claims Nos. 11, 13, 17, and 18 in appellant's application for a patent for an alleged invention relating to a process of treating wood pulp and the like.

Many uses for the pulp, treated by appellant's process, are recited in his specification, among them that of making sanitary pads, and claim 18 specifies such an article. This use was greatly emphasized in oral argument on appellant's behalf.

We quote claims 11, 13, and 18 as illustrative of the appealed claims:

11. The process of treating wood pulp or similar material consisting in forming the wood pulp into a sheet with the individual fibres thereof relatively loosely united to each other carding the pulp, felting such carded pulp, forming said pulp into a strip, applying a material having adhesive properties and comprising a starchy material to a surface of the pulp so as to impregnate a portion only of the thickness of the strip and securing together the adhersive coated faces of two sections of such treated pulp to form a composite strip having an intermediate compacted stratum leaving the outer layers in a relatively loose and fluffy condition.

13. The process herein described which consists in forming wood pulp into a sheet with the individual fibres thereof relatively loosely united to each other, carding such sheet, condensing such carded material to form a continuous strip of felted material and applying aqueous starch to a surface of the material.

18. The method of making sanitary pads from wood pulp sheets having wood fibers loosely united, such sheets having a relatively high density and a relatively low absorptiveness rendering the same unsuitable for use in sanitary pads, said method comprising the steps of carding the said sheets and converting the same into an extremely light soft and fluffy material closely resembling cotton in very light condition and converting such material into a continuous strip of dimensions suitable for sanitary pads by felting the same only sufficiently to interlock the variously arranged pulp fibers to give the same a satisfactory degree of strength and rendering the said strip highly absorptive and readily disintegrable in water, then severing successive end portions of the strip to form individual sanitary pads of appropriate size.

The references are: Weiss, 1,489,567, April 8, 1924; Williams, 1,702,530, February 19, 1929; British patent, 24,183, December 16, 1914.

Although the claims are more or less self-explanatory, nevertheless, we deem it advisable to quote from the brief of counsel for appellant relative to the process here claimed:

Briefly described, the method consists in (1) subjecting wood pulp to a preliminary treatment so as to form therefrom wood pulp sheets having the individual fibers of the sheet relatively loosely united to each other * * *, (2) carding this sheet material so as to tear apart the fibers of the sheet, thus converting the pulp into an extremely light, fluffy material closely resembling cotton in very light condition * * *, (3) forming such material into a continuous strip of dimensions suitable for sanitary pads, by felting the material only sufficiently to interlock the variously arranged pulp fibers to give the felted strip a satisfactory degree of strength and to render the strip highly absorptive and readily disintegrable in water * * *, (4) spraying a surface of the strip with aqueous starch or similar material * * *, and (5) forming a duplex strip from two of the strips by placing them together so that the layer of starch intermediate the strips acts to bind the whole pad together and to give it adequate strength throughout * * *.

It is pointed out in the brief of counsel for appellant that the appealed claims are not limited to the particular manner of treating the wood pulp, this step being covered in some of the allowed claims. It is said that the purpose of the appealed claims

"is to cover the methods recited in the claims without specific limitation to the manner of the *preliminary* treatment of the pulp." [Italics ours.]

The patent to Weiss relates to insulating material made from loose fibrous material fed into a shredding machine where the fibers are separated into "individual particles" in such manner that they may be deposited upon a support to form a "flocculent layer of heterogeneously arranged" individual fibers which can be cemented together by an adhesive, and teaches that the result sought may be obtained by brushing or combing the fibers with a stiff wire brush rotating at a high rate of speed. The shredded or combed material is spread in a thin layer on a moving conveyor screen, sprayed with an adhesive agent, and subjected to a countercurrent of hot air. It is then coated on one or more surfaces with a substantially air-resisting and moisture-resisting material, "such, for example, as asphalt, pitch, rubber, or the like."

The British patent is for a method of producing cellulose wadding. In the process, rolls of dry cellulose pulp board, made in paper-making machines and having their fibers lying substantially parallel to one another, are utilized as the raw or starting material. The material is passed over a series of disintegrating or carding rollers, which may rotate in a direction opposite to the main rollers, and one of which preferably operates at a greater velocity than one of the main rollers. According to the patentee, this operation produces a

"mass of very loose and flocky or snow like fibres. The latter are then led to a travelling transport band, from whence they will pass through pressure rollers where [by uniting the fibers] they are formed into a light fleece or fabric."

The patent to Williams, who is the applicant in the instant proceeding, was granted upon an application filed subsequent to the filing date of the involved application. Its claims are for the product resulting from the process here sought to be patented. The pad shown in the patent consists of upper and lower layers of readily disintegrating, highly absorbent material, between which layers, according to the specification, is a coating consisting preferably of "potato flour, cornstarch, taploca, dextrine or gelatine," which causes "the adjacent surfaces of such layers to adhere."

It is argued on behalf of appellant, in substance, that Weiss was not concerned with the manufacture of sanitary pads; that the designation of asphalt, coal tar and similar pitches, rubber, solution of gums, resins, etc. as proper adhesive agents by which the "mat" produced by the patentee can be rendered "fire-proof, rat-proof and moisture-proof" indicates how far afield the Weiss patent is from the problem confronting appellant; that the material produced by the patentee's process is not loose and fluffy, and the outer layers of his "mat" are not highly absorptive, as required by appellant's process; and that

"The outstanding characteristic by which the Weiss disclosure may be differentiated from the invention of the appealed claims * * * is that the practice of the Weiss method yields"

an entirely different product.

It should be remembered that the claims here involved are directed to a process, not to an article. Accordingly, the mere fact that Weiss used a different adhesive and secured a different product does not necessarily, as stated by the Solicitor for the Patent Office,

"indicate that there is any difference in the process so far as the step of using an adhesive is concerned."

In re Dreyfus, 20 C. C. P. A. (Patents) 1204, 65 F.(2d) 472, 437 O. G. 7.

As to the British patent, appellant argues that it does not disclose the step of forming the wood pulp into a sheet with the individual fibers relatively loosely united to each other; that it does not disclose the step of felting the carded pulp; and that as the "loose and flocky snow like fibers" drop onto the conveyor they are merely a mass, which, after being compressed, is in the form of a "light fleece or fabric." The drawing, it is said, shows the compressed mass to be in the form of a "thin sheet."

There is nothing in the appealed claims which limits the thickness of the sheet, and we think it is clear from the method described in the British patent that when the mass of very loose and flocky snow-like fibers is placed on a traveling transport, the fibers are in sheet form, as shown in the drawings of the patent, and are relatively loosely united to each other.

In appellant's brief it is stated that "felting", as used in the appealed claims, means

"felting the material only sufficiently to interlock the variously arranged pulp fibers to give the felted strip a satisfactory degree of strength and to render the strip highly absorptive and readily disintegrable in water."

We think it is clear, as stated by the Board of Appeals, that uniting fibers into a fleece or fabric, as stated in the British patent, is the equivalent of "felting", as defined in appellant's application.

Relative to appellant's own patent, it is pointed out in his brief that the application therefor having been copending with the instant application, the patent does not constitute prior art with reference to the present application. It is argued that the patent is not concerned with the manner in which the layers are made, nor

"with the steps of 'forming the wood pulp into a sheet with the individual fibers thereof relatively loosely united to each other' or the carding of the sheet,"

specifically described in the appealed claims, and that it could be used only for the purpose of preventing double patenting.

The Primary Examiner stated that appellant's patent discloses the

"adhesion of two * * * sheets of fluffing pulp by means of starch adhesives and the granting of an additional patent on the process would have the effect of illegal—prolonging the life of his article patent,"

and that

"claim 18 as well as the other claims is believed to be properly rejected since so far as the laminated feature is concerned, this is covered by applicant's patent and insofar as the felt forming steps are concerned, they are old or conventional steps commonly taken to produce felts."

Each of the tribunals of the Patent Office referred to appellant's application, Serial No. 294,501, relating to a process for making the pad shown in his Patent No. 1,702,530, and, with regard thereto, the Board of Appeals said:

The disclosure in said application was the same as in the patent. On an appeal to the Board of Appeals, the claims to the method were held to be unpatentable over what was claimed in the patent because they merely recited the obvious way of making pads claimed in the patent. The present application contains additional disclosure as to the preliminary steps of making the pulp into the desired form for constructing the strips from which the pads are made. The Examiner holds that these steps are old in prior art patents and as they are more or less independent of what is the final article made from the prepared pulp, applicant has made no patentable advance over what he has claimed in his prior patent by employing these old preliminary steps in preparing the pulp. Applicant argues that the patents cited do not show these preliminary steps or their equivalent.

In reply to that statement of the Board, counsel for appellant state in their brief that—

Claim 11 now on appeal differs from the subject matter refused in Serial No. 294,501 by reciting the step of "forming the wood pulp into a sheet with the individual fibers thereof relatively loosely united to each other." This step is not disclosed in applicant's issued Patent No. 1,702,530, nor was it claimed in Serial No. 294,501.

For the reasons heretofore pointed out in discussing the patent to Weiss and the British patent, it is submitted that the "preliminary steps" referred to by the Board of Appeals are clearly not present in the reference patents.

It would seem from the quoted statement of counsel that the only step in the involved claims not present in the claims of appellant's application, No. 294,501, is that of "forming the wood pulp into a sheet with the individual fibers thereof relatively loosely united to each other," which step appellant alleges is not disclosed in his patent.

We are of opinion, as were the tribunals of the Patent Office, that that step is clearly disclosed in the British patent.

It will be observed that claim 18 includes the additional step of "severing successive end portions of the strip to form individual sanitary pads of appropriate size." This is the only step not disclosed in the references. However, it was evidently included in the process claims of appellant's application No. 294,501, but, whether it was or not, it certainly does not involve invention to sever the sheet material used by appellant at the proper places to "form individual sanitary pads of appropriate size."

After describing the references of record somewhat in detail and referring with approval to the holding of the Primary Examiner, the Board of Appeals concluded its decision with the following statement:

All of the claims include the steps of forming wood pulp into a sheet with the individual fibers thereof relatively loosely united to each other carding the sheet and felting such carded pulp. We believe that the British patent shows the full equivalent of these steps. We do not believe any invention is involved in employing these steps in making the strips from which the pads are formed in applicant's prior patent.

Having already discussed the important contentions made by counsel for appellant, we deem it unnecessary to mention others set forth in their brief.

We are in accord with the conclusions reached by the Patent Office tribunals, and the decision of the Board of Appeals is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

DIETERICH *v.* LEAF

No. 3,773. Decided April 5, 1937

[89 F.(2d) 226]

1. INTERFERENCE—DESIGNS—REDUCTION TO PRACTICE.
   The making of a drawing of an ice cream cone and exhibiting it to others *Held* not to constitute a reduction to practice.
2. SAME—SAME—PRIORITY.
   Record reviewed and priority *Held* properly awarded to L.

APPEAL from the Patent Office. Affirmed.

Mr. Albert E. Dieterich, pro se.

Messrs. Williams, Bradbury, McCaleb & Hinkle, and *Mr. Robert H. Wendt* for Leaf.

GARRETT, *J.*:

This is an appeal in an interference proceeding arising in the United States Patent Office between a patent to the party Leaf, issued October 31, 1933 (for a period of fourteen years), upon an application filed July 31, 1933, and an application of the party Dieterich filed November 7, 1933, the subject matter being a design for ice cream cones of a "double header" type. Leaf is the senior party, the patent to him having, in fact, been issued prior to the filing date of Dieterich. The Examiner of Interferences and the Board of Appeals concurred in the finding that Dieterich was not entitled to any date earlier than his filing date for reduction to practice. The Examiner of Interferences also held that even if there was reduction to practice by reason of the facts hereinafter related, at the time claimed by Dieterich, there was such "concealment, suppression or abandonment" as to require an award of priority to the senior party, under the case of *Mason* v. *Hepburn*, 13 App. D. C. 86, 84 O. G. 147.

The latter ground was nowhere alluded to in the decision of the Board of Appeals.*

*In the case of *In re Wagenhorst*, 20 C. C. P. A. (Patents) 991, 64 F.(2d) 78, we held, in effect, that unless the Board expressly reverses some ground of an Examiner's adverse decision, the Board's general affirmance would be treated as having the legal effect of a rejection upon all the grounds and references cited by the Examiner. This we understand to have been the rule usually followed by the Court of Appeals of the District of Columbia (now the United States Court of Appeals of the District of Columbia), our predecessor in this jurisdiction. The rule, we think, is correct, especially as to prior art references which the Examiner may cite, but we deem it not improper to direct attention to the fact that, in the *Wagenhorst* case, supra, we quoted the relevant portion of section 482 R. S. (35 U. S. C. A. 6), defining the duty of the Board in cases appealed to it, and said "It would seem that this duty is not fully performed without a review of *all* adverse decisions by the Examiner." It is, to say the least, quite desirable that there should be a finding by the Board itself upon each question decided by the Examiner which, standing alone, would be determinative of a case, in order to avoid a remand in the event of the court finding itself in disagreement upon the point or points which the Board regards as decisive.

The question of reduction to practice in the instant case may be stated thus: Does the completion of a mere drawing of a design with exhibition thereof to the public constitute reduction to practice of the design?

Peculiarly, in view of the long period (beginning in 1842) during which design patents have been authorized by statute, the question of just what constitutes reduction to practice of a design, although several times the subject of consideration and decision in the Patent Office, does not seem ever to have been definitely defined by any court. See the case of *In re William Schnell*, 18 C. C. P. A. (Patents) 812, 46 F.(2d) 203, 405 O. G. 3, for a review of the design patent statutes.

The particular state of facts here before us is, in substance, as follows: Appellant is a patent attorney. Acting in that capacity, he, beginning in 1929, represented a client by the name of James Balton in the prosecution in the Patent Office of an application for patent for design of an ice cream cone. The application was rejected by the Examiner and appeal was taken to the Board which seems finally to have granted the patent on November 20, 1934. Mr. Dieterich, as attorney for Balton, filed a brief before the Board and in connection therewith filed certain drawings made by himself with which to illustrate his argument. The drawings upon a sheet of paper, designated "Exhibit C to the brief," disclosed four different shapes or forms of cones which are comprised in the drawings of the Dieterich application here at issue, Figure 3 thereof being stated to constitute "the subject-matter of the present application in interference." Exhibit C was filed in the Patent Office, along with the brief, on June 12, 1930, a little more than three years prior to the filing date of the Leaf application. Previous to the exhibit being filed with the brief it, or a sketch like it—Balton thinks the original—was shown to Balton, this occurring according to Balton's testimony, during the last of May, 1930. The testimony of appellant indicates that he also disclosed it to persons in his employ. Appellant stated in his testimony that his drawings were modifications "of form of the Balton double header cone," and in explaining why he did not earlier file an application for patent said:

> At the time I made up this design in May, 1930, I did not consider that it was a matter involving invention as it seemed to me to be simply an obvious modification of the Balton double header cone. However, when I became advised of the issuance of the Leaf patent involved in this interference and found that the Patent Office had apparently considered the design to involve invention I accepted the view of the Patent Office and filed this application, and asked for an interference in order to prove my priority.

Balton testified that cones in conformity with his design were placed on the market commercially about March, 1930, and there are on file as exhibits prints from photostatic copies of advertisements of them, containing pictures of the cones. The photostatic copies, appellant testified, were filed with the brief before the Board in 1930.

We quote the following additional testimony of appellant because it embraces in part the idea expressed in the argument on his behalf upon the question of reduction to practice:

> Q. 4. Did you ever make an ice cream cone of the form disclosed in Figure 3 of Exhibit C, i. e., the form disclosed in the present application in interference? If not why? A. I did not, for the simple reason that in my humble opinion it was not necessary, to make up this form into an actual cone. The Balton double pocket cones constructed as shown in the advertising pages which accompanied the brief before the Board of Appeals in the Balton application, and photostats of which are attached to the certified copy, had both been put upon the market and found to be successful reductions to practice. As the cone which I designed was a mere modification of the form of the Balton double header cone and from a mechanical standpoint in all respects the equivalent thereof there was no necessity for embodying the design which I made into an actual ice cream cone. The mere making of the drawing or sketch known as Exhibit C attached to the brief before the Board of Appeals and its disclosure to Balton and the Patent Office officials, as well as to those in my employ, I considered to be all the reduction to practice necessary in law in view of the simple nature of the case and the fact that an equivalent structure had already been reduced to practice in the Balton cone.

There is testimony to the effect that the Balton application became involved in two interferences, from which it is supposed it is intended that the inference be drawn that, with the making available to interferants of the Balton file wrapper appellant's sketch was further publicly disclosed.

Appellant contends that a design invention stands on a different footing from mechanical and other inventions, and is so recognized by the statute, and that the making of a sketch, or drawing, clearly showing the design, and its public disclosure, is the equivalent of conception and reduction to practice under the mechanical patent laws, and constitute a completion of the invention under the design patent laws. To this end, he urges that Sec. 4886 R. S., (35 U. S. C. A. 31), has reference to new and useful inventions in an art, machine, etc., and that Sec. 4929 R. S. (35 U. S. C. A. 73), has reference to new, original and ornamental design *for* an article of manufacture; that it is the ornamentality which is the essential factor, and further that it is design, not the article itself, which constitutes the invention. It is said that the requirement for reduction to practice in patent cases grew up through judicial construction without any statutory authority, there being no statute requiring an inventor to reduce his invention to actual practice and sell it; that it grew out of the difficulties incident to picturing, by drawings, and describing machinery and the like in a manner to disclose the potent factor of operativeness or successful performance of function, and that since design is a matter of appearance the doctrine of reduction to practice by embodying the design in a structure is not applicable. Numerous cases are cited relating even to mechanical patents in which the courts used expressions tending to indicate that in some instances a drawing might be a sufficient reduction to practice.

We think in most of those cases the expressions upon this point constituted dicta. In any event, a mechanical or product or process case in which a drawing alone will constitute actual reduction to practice must be set down as an exception, and a rare one, to the general rule applied modernly and for a long period in the past.

We find that in the Patent Office practice, the tendency has consistently been (the only exception found in such cases as have been brought to our attention being in the matter of a design made on paper for wall paper, a readily understandable exception) to carry into design cases arising under R. S. 4929, the same rule as to actual reduction to practice as that applied in cases arising under R. S. 4886, especially with reference to three dimensional articles. Appellant concedes this, but insists that it has been done erroneously. Both the Examiner of Interferences and the Board cited the cases of *McArthur* v. *Gilbert*, 1904 C. D. 245, and *In re Cady*, 1916 C. D. 57. The Examiner cited also the case of *Grafton* v. *Langenbach*, 58 Ms. D. 22, in which he states

> "a drawing was definitely held not to be a reduction to practice of a design for a metallic finishing plate."

The Board regarded the *McArthur* v. *Gilbert* case, supra, as being controlling in the instant case although stating the facts of the two cases not to be identical. It was there held, to quote a syllabus of the decision, that

> "A prior mechanical application is not a constructive reduction to practice of the invention disclosed in a later design application filed by the same party."

Few court decisions have been found which seem to have any particular bearing upon the question. The decision in the case of *Faris* v. *Patsy Frok & Romper Co.*, 273 Fed. 900, in its reasoning may be said to have some bearing, although rather remote. Also the case of *Tyler* v. *St. Amand*, 17 App. D. C. 464, 94 O. G. 1969, and our own cases of *In re Schnell*, supra, and *George N. Mas* v. *Chapman J. Root*, 19 C. C. P. A. (Patents) 819, 54 F.(2d) 435, 416 O. G. 804. In the latter case, which involved a design for a bottle, Mas made a drawing of the design in 1920 but never embodied the design in a structure, he relying upon his filing date of September, 1925, for reduction to practice. Root conceived later than Mas but was prior as to his filing date. Mas was held not to have been diligent from about the time Root entered the field upon September, 1920; hence priority was awarded to Root. If appellant's contention in the instant case be correct Mas, had he made public disclosure of his 1920 drawing, might have been entitled to that date for reduction to practice and hence completion of the invention. We did not, however, pass upon the question there, it not having been raised in the reasons of appeal, nor referred to in the briefs or arguments.

We may add that little aid has been derived from such text books on patent law as we have been able to examine. So far as this court is concerned, therefore, the issue is a matter of first impression.

That appellant's drawing constituted conception seems clear, but is it in accord with the letter and spirit of the design patent statutes to hold that it also constituted reduction to practice? R. S. 4929 is, of course, based upon the same constitutional provision as R. S. 4886, and section 4933 R. S. (35 U. S. C. A. 73), provides:

> All the regulations and provisions which apply to obtaining or protecting patents for inventions or discoveries not inconsistent with the provisions of this [design patent] title, shall apply to patents for designs.

Some expressions in some judicial decisions in the past have possibly had a tendency to confuse the public as to the real nature which a design must disclose in order to render it patentable. We think it is very well understood that the decision of the Supreme Court of the United States in the famous case of *Gorham Company* v. *White*, 81 U. S. 511, was clarified by the later decision of that Court in the case of *Smith* v. *Whitman Saddle Company*, 148 U. S. 674, 63 O. G. 912. Macomber, in The Fixed Law of Patents, Second Edition, p. 24, says:

> A true design appeals to something more than the eye in the ordinary sense of that term. It appeals through the eye to the artistic consciousness—not by any particular feature, contour or configuration, or even a collocation of elements, as in the case of a trade-mark—and awakens a response in the mind of the person possessed of a sense of art. If it falls short of this, if to the person with this sense it is merely peculiar or ornamental, it is not the creation by one mind of that which awakens a response in the mind of another, which constitutes true design invention.

[1] We shall not here undertake to say that with reference to certain classes of designs having only two dimensions, such as wallpaper, or the like, a mere drawing of the design upon suitable material may not be sufficient to constitute reduction to practice without the design being embodied in

an article of manufacture. It is not required in the case of a mechanical article that the invention shall be embodied in a commercial structure, and it may well be that drawings of designs for flat surfaces might be ample. In the case of a three-dimensional article, however, it seems to us that something more than a mere paper drawing is requisite to constitute actual reduction to practice.

We do not attempt, because the facts of the case do not require it, to define just what may be essential to constitute actual reduction to practice of a design for either a two-dimensional article or a three-dimensional article, but that a design, particularly for the latter, should be embodied in some structure other than a mere drawing, we think, is required, particularly under the provisions of R. S. 4933, supra.

There is no issue as to appellant's diligence here and that question is not before us. Nor is it essential that we pass upon the question of abandonment, concealment and suppression raised by the Examiner of Interferences.

[2] We concur with the holdings of the tribunals of the Patent Office upon the question of reduction to practice, and the decision of the Board of Appeals is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

KOLLSMAN *v.* CARBONARA

No. 3,776. Decided April 5, 1937

[88 F.(2d) 966]

INTERFERENCE—PRIORITY—NEW MATTER IN REISSUE PATENT.

In interference involving application of C. and reissue patent of K. record reviewed and award of priority to C. on ground that invention in issue in the interference was new matter in K.'s reissue application, affirmed.

APPEAL from the Patent Office. Affirmed.

Mr. Leonard Day for Kollsman.

Messrs. Cameron, Kerkam & Sutton, and *Mr. Loyd H. Sutton* for Carbonara.

LENROOT, *J.:*

This is an interference proceeding arising in the United States Patent Office. It involves a reissue patent to appellant, No. Re. 19,079, granted February 13, 1934, and an application of appellee filed November 5, 1932, Serial No. 641,446. Appellant, on October 27, 1932, filed application for a reissue of a patent granted to him on May 10, 1932, No. 1,857,311, upon an application filed December 10, 1931. The reissue application was divided into three divisions, and the divisional application upon which his patent here involved was issued was filed on December 20, 1933. Claims corresponding to the counts before us were copied by appellee from appellant's said reissue patent for the purpose of interference.

The interference was declared October 9, 1934. Both parties filed preliminary statements. Appellant alleged dates of conception in 1929 and reduction to practice in 1930; appellee alleged conception and disclosure of the invention in February, 1932, and reduction to practice in June, 1932.

Appellee's dates set forth in his preliminary statement being subsequent to the date of the application upon which appellant's original patent was issued, the Examiner of Interferences issued an order to appellee to show cause why judgment should not be rendered on the record against him.

Thereupon appellee moved to dissolve the interference on the ground that appellant had no right to make the claims in his reissue patent corresponding to the counts here in issue.

The counts are seven in number; count 1 is illustrative and reads as follows:

> 1. An altimeter comprising a dial having a circular indicating scale; aneroid means; a spindle rotatable by said aneroid means; a casing having provisions for holding said aneroid means stationary relatively thereto; a pointer concentrically rotatable relatively to said scale; planetary gearing interconnecting said spindle with said pointer; and means for revolving the axis of one of the planet gears of said planetary gearing about said spindle to effect a setting adjustment of said pointer relatively to said scale.

The Examiner of Interferences denied the motion to dissolve and awarded priority of invention upon all of the counts to appellant. The Board of Appeals reversed the decision of the Examiner and awarded priority to appellee. From this decision of the Board, appellant took this appeal.

The general nature of the invention here involved is stated in appellant's reissue patent as follows:

> One general object of the invention is to provide for relative adjustment movements between various elements of the indicating means of an aneroid altimeter in a simple and efficient manner without interfering with the indicating functioning of the instrument in response to the aneroid means. More particularly, an object of the invention is to provide for the adjustable manual setting of the altimeter relatively to a predetermined altitude such as the altitude of a landing field, designated either in feet altitude or barometric pressure, so that contemporaneous changes are made in the indication of reference means and an altitude indicating means, both, if desired, throughout a complete rotation of a reference element, and so that the sum of the said changes is a constant and is equal to zero in the same unit of measure.

The more particular features of the invention which are the subject of this interference will be hereinafter discussed.

Appellant raises some preliminary questions which will be briefly considered.

Appellant first contends that appellee filed no affidavit that his invention ante-dated appellant's filing date, as required by rule 94 of the rules of the Patent Office. It does appear from the record that appellee did file an affidavit, purporting to be under rule 75, setting forth that he made the invention prior to the date of appellant's reissue application. The Examiner held this affidavit was ineffective because, as held by him, appellant was entitled to the filing date of the application upon which his original patent was issued, to wit, December 10, 1931. The question before us on this phase of the case is whether appellant is entitled to this early date. If he is not, appellee's affidavit was sufficient under rule 94, although purporting to be under rule 75.

Appellant further contends that, under rule 125 of the rules of the Patent Office, the Board had no jurisdiction to consider appellee's appeal, there having been no testimony taken and no concession of priority, disclaimer, or declaration of abandonment. Rule 125 contains the phrase "except as herein otherwise provided." Rule 119 provides for judgment upon the record in certain cases, and the case before us comes within that rule, liberally construed.

Appellant further contends that, inasmuch as the interference is between an application of appellee and a patent issued to appellant, the Patent Office tribunals had no right or power to pass upon the question of whether the reissue patent was authorized under the facts in this case. The statute (R. S. 4904, U. S. C., Tit. 35, §52) expressly authorizes an interference between an application and an unexpired patent. Wherever, in an interference between a patent and an application, priority of invention is awarded to the applicant and a patent to him is thereafter issued, there will be outstanding two patents for the same invention, and the courts of equity have jurisdiction to decide as to which of them is valid. In this proceeding the Board of Appeals has not held that appellant's reissue patent is invalid, and it had no power so to do, although the result of its decision may cast a cloud upon appellant's patent.

We now come to a consideration of the question of the right of appellant to make the claims in his reissue patent corresponding to the counts here involved. The Board of Appeals stated that this was the only question considered by it.

The answer to this question depends wholly upon whether appellant's reissue application and patent contain new matter upon which the counts before us are based, such new matter being prohibited by the reissue statute, R. S. 4916, U. S. C., Tit. 35, §64.

The Examiner of Interferences held that appellant's original patent furnished a proper basis for the matter contained in the reissue application, and that therefore said reissue patent did not contain new matter as that term is understood in patent law. He also held that the form or species of the invention embraced in the counts before us was contemplated by appellant in his original application, upon which his Patent No. 1,857,311 was issued, and that through inadvertence and mistake appellant there failed to claim it.

In his statement the Examiner of Interferences said:

> • • • How then can this be fatally new matter in a reissue, the structure being originally shown and described, an inseparable portion of the apparatus, the operation inherent and, as the Examiner believes, inevitable therein? Moreover, the Examiner has indicated above wherein the original statement of objects and claims embraced this so-called new position, as well as the portions of the specifications bearing thereon.

The Board of Appeals sharply disagreed with the Examiner of Interferences, both upon the question of the disclosure of appellant's original patent, and also upon the intent of appellant in his original application to secure protection of his invention by means of claims of the character of the counts before us. In other words, the Board held that the reissue patent here directly involved contains new matter not found in appellant's original application and patent, and that there was disclosed no inadvertence or mistake in failing to make claims in said original application corresponding to the counts here involved.

The mechanism of the invention here involved is very intricate, comprising many gears and parts, and without a reproduction of many drawings and the use of a large number of reference figures it would be impossible here to describe intelligently *all* of the details of the invention. We do not think it necessary to reproduce these drawings, for we can sufficiently describe the particular points here in issue without so doing.

The original patent to appellant disclosed an altimeter having provision for adjustment to set the same so that it would show zero when it reached a landing field of known height above sea level. This is accomplished through the operation of certain gearing which is manually actuated by a knob on the outside of the instrument. Two pointers are attached to a spindle, the rotation of which spindle causes said pointers to rotate over the face of a dial, which dial is scaled from 0 to 10. An indicator or reference marker, movable with respect to the dial, is placed at the edge of the dial. The scale figures 0 to 10 indicate altitude in hundreds of feet with the long pointer, and in thousands of feet with the shorter pointer.

When the indicator or reference marker at the edge of the dial is set at zero, the pointers, through barometric pressure, will register upon the dial the altitude above sea level. If a landing field is 400 feet above sea level and it is desired to zero the instrument at the altitude of the landing field, then the control knob is rotated in a clockwise rotation until the reference marker at the edge of the dial, likewise rotating in clockwise direction, reaches the scale indication of 400 feet. At the same time the rotation of the knob causes the long pointer to move through a corresponding arc in a counter-clockwise or negative direction, thus subtracting from the true altitude indication of the instrument the amount of 400 feet, so that thereafter the altimeter registers the actual altitude above the known altitude of the landing field, instead of the true altitude above sea level which it would indicate with the reference marker set at zero. In other words, with this setting the pointers will indicate an altitude four hundred feet less than if the instrment were set for altitude above sea level, and the said pointers will indicate the true altitude above the landing field. This is denominated in the original patent of appellant and also in his reissue patent as position No. 1.

The second position is obtained by the operation of gearing, actuated by the manipulation of the knob in a different manner, whereby the dial and pointers are moved to a position where the long pointer occupies a horizontal position, so that any increase or decrease in altitude from level flight is registered by a raising or lowering of the pointer with respect to the horizontal; in this position, since the pointers and scale are both rotated, the altitude indication itself is unchanged. This is denominated

as position No. 2 in both the original and reissue patents of appellant.

Neither of these positions, nor the mechanism connected therewith, is involved in this interference.

In appellant's original patent a third position of the altimeter is shown, known as position No. 3. This position requires that a set screw in the back of the instrument be removed, permitting a relative adjustment of the pointers and reference marker through rotation of said knob. The patent states, after explaining the mechanism of said adjustment, as follows:

> • • • Hence this operation of the device may be utilized mainly for setting or adjusting the reference means, as in the event that the instrument should be inaccurate because of a change in the indicator 11. This third position may be called the adjusting position. After it is completed, the screw 56 is replaced to avoid accidental retraction to the third position, since the latter, if inadvertently used, may result in throwing the instrument parts entirely out of their proper relations.

It is this third position in appellant's original patent that is in controversy here. In appellant's reissue application there are four positions disclosed, instead of three as in his original patent. The first two positions, as disclosed in the reissue patent, are the same as those disclosed in the original patent. The third position disclosed in the reissue patent accomplishes the same result as the third position disclosed in the original patent, insofar as a corrective setting of the instrument is concerned. However, this is not secured in the same way in the reissue patent as a corrective setting was secured by the third position in the original patent. In the original patent this was secured, as above stated, by the removal of a set screw, which is indicated by the numeral 56 in the drawings, and then by turning the knob so that the pinion engages only one gear, indicated in the drawings by the numeral 20, and this turning of the knob is continued until the desired corrective setting is accomplished. After this is secured, the set screw is replaced in its original position. In the reissue patent, however, the third position is accomplished by the pinion engaging two gears instead of one. In other respects the operation is the same in both patents.

As hereinbefore stated, the original patent does not disclose a fourth position, but appellant claims that the fourth position of the reissue patent is effected by manipulation of the same mechanism as is disclosed in the original patent for the third position shown therein. This fourth position serves the same purpose as the first position in both patents, and is merely an alternative position, according to the will of the operator. All of the counts before us read on this fourth position, as disclosed in the reissue patent, and the question to be decided is whether this fourth position is, in effect, the same as the third position disclosed in the original patent with the set screw removed. The Examiner held that it was so disclosed, but the Board of Appeals held to the contrary. In its decision the Board pointed out that, in the reissue patent, it is stated that two gears, specified in the drawings as gears 16 and 24, are held in *frictional* engagement at their peripheries with the casing of the instrument, the casing being indicated in the drawing by the numeral 19, while in the original patent it was stated that one of said gears, indicated by the numeral 16, has a *bearing* engagement with the casing, and no mention is made by the patent that said gear is frictionally held by the casing. The Board further pointed out that the original patent stated that the other of said gears, viz., gear 24, may be held stationary in any suitable manner, as by frictional engagement with said gear 16, or otherwise, but that the patent contained no intimation that there was frictional engagement between said gear 16 and the casing. The Board was therefore of the opinion that the disclosure of the reissue patent differed in structure from the disclosure of the original patent, and that this difference constituted new matter to support the alleged operation in the fourth position of the reissue patent, and that, inasmuch as appellant's claims corresponding to the counts in issue are based on the operation of the altimeter in the fourth position, they cover matter not disclosed in the original patent.

We are in accord with this conclusion, and hence are of the opinion that appellant may not rely upon his original patent as a basis of an award of priority upon the invention embraced in the involved counts.

The Board of Appeals also found that appellant's original patent does not indicate any intention to cover the subject matter here involved. It pointed out that said original patent did not indicate that the third position disclosed therein had any purpose other than a setting or adjusting position for the purpose of correcting inaccuracies in the instrument.

We are also in accord with this conclusion and point out that the original patent taught that the set screw should be replaced when the correction was made, so as to prevent accidental movement of the pinion indicated by the numeral 54 in the drawings. It is conceded that, with said set screw in place, the third position of appellant's original patent could not secure the results accomplished by the fourth position in the reissue patent. In other words, the teaching of the original patent seems to negative any intention therein to secure claims corresponding to the invention here involved. In fact, the original patent taught that it might result in the altimeter being entirely erroneous if operated in the condition where appellant's fourth position of the reissue patent could be secured, that is, with the set screw removed.

Appellant may have had in mind, at the time of filing his application upon which his original patent was issued, the fourth position disclosed in his reissue application; but if he did, the structure disclosed in his original patent did not include it, and we find nothing in the patent itself to indicate that appellant had any intention of securing claims that would cover the operation of what is designated as the fourth position in his reissue patent.

For the reasons stated herein, the decision of the Board of Appeals is affirmed.

Affirmed.

(C. C. A. Tex.) Dodson patent, No. 2,051,550, for cotton gin, claims 1 to 3 *Held* invalid. *Lummus Cotton Gin Co.* v. *Murray*, 92 F.(2d) 69.

Disclaimers

T. M. 154,504.—*Brown & Godet*, Philadelphia, Pa. NAVAL UNIFORMS. Registered April 18, 1922. Disclaimer filed September 24, 1937, by the assignee, *Eagle Clothes.*

Hereby disclaims the representation of an eagle forming part of said trade-mark registration.

1,393,520.—*Ernst Friederich*, Berlin, Germany. ENCLOSED ARC DEVICE AND METHOD OF STARTING THE SAME. Patent dated October 11, 1921. Disclaimer filed November 6, 1937, by the assignee, *General Electric Company.*

Hereby disclaims claims 1, 6, 8, and 14 of said Letters Patent.

1,595,218.—*Aladar Pacz*, Cleveland, Ohio. ALUMINUM-SILICON ALLOY. Patent dated August 10, 1926. Disclaimer filed November 9, 1937, by the assignee, *Aluminum Company of America.*

Hereby disclaims the claims numbered 1 and 2 of said Letters Patent.

2,007,642.—*Martin de Simo*, Berkeley, Calif. PROCESS FOR THE MANUFACTURE OF CARBOXYLIC ACID ANHYDRIDES. Patent dated July 9, 1935. Disclaimer filed October 25, 1937, by the assignee, *Shell Development Company.*

Hereby disclaims and enters this disclaimer to all of claim 6 of said Letters Patent; also disclaims and enters this disclaimer to:—

as much of claim 1 of said Letters Patent as is in excess of the following:

"A process of preparing acid anhydrides which comprises reacting a ketene *containing at least three carbon atoms* with a carboxylic acid containing at least two carbon atoms and containing a different number of carbon atoms than the ketene, in a quantity sufficient to react with any free acid radical and any reactive substituent which may be present, and heating the reaction mixture so as to obtain an anhydride of said carboxylic acid";

as much of claim 2 of said Letters Patent as is in excess of the following:

"A process of preparing acid anhydrides which comprises reacting a ketene *containing at least three carbon atoms* with an aliphatic carboxylic acid containing more than two carbon atoms in a quantity sufficient to react with any free acid radical and any reactive substituent which may be present, and heating the reaction mixture so as to obtain an anhydride of said carboxylic acid";

as much of claim 3 of said Letters Patent as is in excess of the following:

"A process of preparing acid anhydrides which comprises reacting a ketene *containing at least three carbon atoms* with an aromatic carboxylic acid containing a different number of carbon atoms than the ketene, in a quantity sufficient to react with any free acid radical and any reactive substituent which may be present, and heating the reaction mixture so as to obtain an anhydride of said carboxylic acid";

as much of claim 4 of said Letters Patent as is in excess of the following:

"A process of preparing acid anhydrides which comprises reacting a ketene *containing at least three carbon atoms* with an aliphatic carboxylic acid containing at least two carbon atoms and containing a different number of carbon atoms than the ketene, in a quantity sufficient to react with any free acid radical and any reactive substituent which may be present, and heating the reaction mixture so as to obtain an anhydride of said carboxylic acid";

as much of claim 5 of said Letters Patent as is in excess of the following:

"A process of preparing acid anhydrides which comprises reacting a ketene *containing at least three carbon atoms* with a saturated aliphatic carboxylic acid containing at least two carbon atoms and containing a different number of carbon atoms than the ketene, in a quantity sufficient to react with any free acid radical and any reactive substituent which may be present, and heating the reaction mixture so as to obtain an anhydride of said carboxylic acid";

as much of claim 10 of said Letters Patent as is in excess of the following:

"A process of preparing acid anhydrides which comprises reacting a ketene *containing at least three carbon atoms* in the gaseous state with a substantially anhydrous carboxylic acid containing at least two carbon atoms and containing a different number of carbon atoms than the ketene, in a quantity sufficient to react with any free acid radical and any reactive substituent which may be present, and heating the reaction mixture so as to obtain an anhydride of said carboxylic acid";

as much of claim 12 of said Letters Patent as is in excess of the following:

"A process of preparing acid anhydrides which comprises reacting a ketene *containing at least three carbon atoms* with an unsubstituted hydrocarbon carboxylic acid containing at least two carbon atoms and containing a different number of carbon atoms than the ketene, in a quantity sufficient to react with any free acid radical and any reactive substituent which may be present, and heating the reaction mixture so as to obtain an anhydride of said carboxylic acid";

as much of claim 13 of said Letters Patent as is in excess of the following:

"A process of preparing acid anhydrides which comprises reacting a ketene *containing at least three carbon atoms* with an unsubstituted hydrocarbon carboxylic acid containing more than two carbon atoms in a quantity sufficient to react with any free acid radical and any reactive substituent which may be present, and heating the reaction mixture so as to obtain an anhydride of said carboxylic acid";

and as much of claim 14 of said Letters Patent as is in excess of the following:

"A process of preparing acid anhydrides which comprises reacting a ketene *containing at least three carbon atoms* with an unsubstituted hydrocarbon monocarboxylic acid containing at least two carbon atoms and containing a different number of carbon atoms than the ketene, in a quantity sufficient to react with any free acid radical and any reactive substituent which may be present, and heating the reaction mixture so as to obtain an anhydride of said carboxylic acid."

2,020,004.—*David M. Smith*, Hermosa Beach, Calif. OIL ENCLOSED ROTARY. Patent dated November 5, 1935. Disclaimer filed November 8, 1937, by the assignee, *Emsco Derrick & Equipment Company.*

Hereby enters this disclaimer to claims 1, 2, and 8 in said Letters Patent.

2,042,929.—*George M. Dinnick*, Bloomfield, N. J. ELECTRON DISCHARGE DEVICE AND ANODE THEREFOR. Patent dated June 2, 1936. Disclaimer filed November 10, 1937, by the patentee; the assignee, *Westinghouse Electric & Manufacturing Company*, consenting.

Hereby enters this disclaimer to claims 1, 2, and 3 of said patent.

2,045,423.—*John A. Topping*, Bronxville, N. Y. ROOFING AND SIDING. Patent dated June 23, 1936. Disclaimer filed November 9, 1937, by the patentee.

Hereby disclaims claims 1, 2, 3, 7, and 8 of said Letters Patent, except when the subject-matter thereof is embodied in a shingle strip having cutouts or slots therein of the general character of the "cutouts 18" described in lines 18 to 35, inclusive, of page 2 of the specification of said Letters Patent.

BULLETIN OF DECISIONS OF PATENT OFFICE ON TRADE-MARKS, LABELS, AND PRINTS

RENDERED DURING OCTOBER, 1937

ANCHOR PRODUCTS COMPANY *v.* HOSPITAL IMPORT CORPORATION, Trade-Mark Interference No. 2462.

In a decision rendered October 8, 1937 (159 Ms. Dec. 999), *Assistant Commissioner Frazer* held that priority of adoption and use of the term "Anchor" as a trade-mark for surgical needles, was properly awarded to the Hospital Import Corporation, of New York, N. Y.

In his decision, after noting that Anchor Products Company, of Chicago, Ill., had sought to establish an earlier date of use than that alleged in its application, and referring to the testimony to support such earlier date as somewhat inconsistent, the Assistant Commissioner said that at the most it did not establish a date earlier than January, 1922, and that Hospital Import Corporation had established by its testimony an earlier date.

With reference to the argument that the testimony on behalf of Hospital Import Corporation was somewhat vague and indefinite and was not supported by documentary evidence, he said:

"Documentary evidence, however, is not indispensable if the facts in issue are otherwise proved. Here the testimony of registrant's witnesses is consistent, uncontradicted, and in no manner discredited, and it must be accepted as true. While many statements were made which are too indefinite to be given much weight, it sufficiently appears from the record as a whole that registrant started selling surgical needles bearing the 'Anchor' trade-mark in the spring of 1921, and certainly prior to January, 1922."

Then, with reference to the discussion in applicant's brief of other matters, he said:

"Much of applicant's brief on appeal is devoted to a discussion of certain dealings had between the parties which would doubtless be entitled to careful consideration were applicant's right to use the trade-mark in issue, or were registrant now seeking registration over applicant's opposition. In this proceeding, however, the only question for determination is that of priority of use of the mark with the particular goods involved. As applicant has failed to establish a trade-mark use of the mark antedating registrant's first such use, that question was properly resolved in registrant's favor."

EX PARTE LAWRENCE RICHARD BRUCE, INC., Serial No. 361,720.

In a decision rendered October 11, 1937 (159 Ms. Dec. 1001), *First Assistant Commissioner Macklin* held that the term "Single-Touch", as applied to brushes was not descriptive and is registrable for such goods under the act of 1905.

In his decision, after stating that he was unable to think of a brush whose utility or character would be such that "Single-Touch" would be a natural or descriptive term for it, the First Assistant Commissioner said:

"At the hearing a narrow brush, the bristle ends of which describe an arc, was submitted, and it is said by the applicant that the arcuate shape permits applying dye to the hair with less strokes than would be used by a normally straight brush. As a matter of fact, a single touch of such a hair dyeing brush would accomplish no desirable purposes, but repeated applications or 'touches' would be needed to complete the hair dyeing processes. To me the term 'Single-Touch' is not particularly suggestive, but seems to be a rather distinctive, arbitrary name which is clearly registrable."

GENERAL BAKING COMPANY *v.* SAMUEL BRASS, Opposition No. 15,553.

In a decision rendered October 12, 1937 (159 Ms. Dec. 1002), *Assistant Commissioner Frazer* held that the opposition of General Baking Company, of New York, N. Y., to the registration by Samuel Brass, of Belleville, N. J., of the term "Bond" as a trade-mark for yeast, was properly sustained on the ground that General Baking Company had used that mark on bread long prior to the claimed use by the applicant and that bread and yeast are goods of the same descriptive properties.

In his decision, after stating that on appeal the only contention made was that the word "Bond" is a suggestive trade-mark and not entitled to broad protection, and referring to trade-mark infringement suits where the courts had applied that doctrine, the Assistant Commissioner said:

"A contrary conclusion has long since been reached by the Court of Customs and Patent Appeals. (Quoting and citing from *National Biscuit Co.* v. *Sheridan*, 18 C. C. P. A. 720, 44 Fed.(2d) 987.)

"As the marks here involved are identical and the goods of the parties are conceded to be of the same descriptive properties, the registration applied for is barred by the express language of the statute."

AMERICAN MAID COMPANY, INC., *v.* NATIONAL GARMENT COMPANY, INC., Cancellation No. 2926.

In a decision rendered October 15, 1937 (159 Ms. Dec. 1003), *Assistant Commissioner Frazer* held that National Garment Company, Inc., of St. Louis, Mo., was not entitled to register the words "Maiden America" as a trade-mark for children's and ladies' dresses, etc., in view of the prior use by American Maid Company, Inc., of Chicago, Ill., of the term "American Maid", for the same goods.

With reference to an argument by the applicant that one of petitioner's registrations shows the words "American Maid" in connection with pictorial features and that these features had not been used since 1930 and therefore the total mark was abandoned, the Assistant Commissioner said:

"The point is not of controlling importance, because it is not disputed that the words 'American Maid' have been in continuous use by petitioner, and it is those words only with which respondent's mark was found to conflict. It may be said in passing, however, that if respondent deems itself injured by petitioner's registration, and can show either that the mark has been abandoned or that it is descriptive, respondent's remedy is by petition for cancellation."

Then, with reference to the argument based on the use by petitioner of the term "American Maid Comfo-Fit", one party urging that the entire notation must be considered in connection with the use of petitioner's mark and the other that the term

referred to was merely used to indicate grade or style, he said:

"In either event 'American Maid' and 'Maiden America' are in my opinion the predominant features of the respective marks in question, and I agree with the Examiner that their occurrence renders the marks as a whole confusingly similar."

PUREX CORPORATION, LTD. *v.* PUREX PRODUCTS, INCORPORATED, Opposition No. 15,598.

In a decision rendered October 20, 1937 (159 Ms. Dec. 1005), *Assistant Commissioner Frazer* held that Purex Products, Incorporated, of Baltimore, Md., was not entitled to register, as a trade-mark for food flavoring extracts, a mark consisting of the notation "Pur-X" arranged above the words "Purex Products, Inc.", and the letters "PP" printed in a monogram, since such a mark constitutes an appropriation of the corporate name of the opposer, Purex Corporation, Ltd., of Los Angeles, Calif.

With reference to the goods upon which the mark was used, the Assistant Commissioner said:

"The goods specified in the application are food flavoring extracts and tea. Of the various items in which opposer deals the only one that may properly be classed with such goods is vinegar, but that item is of the same descriptive properties within the meaning of the Trade-Mark Act. *Joseph Tetley & Co.* v. *Bay State Fishing Co.*, 23 C. C. P. A. 969, 82 Fed.(2d) 299. This is material to the question under consideration, because there is greater likelihood of confusion than if the goods of the parties were entirely different."

Then, after noting the composite character of applicant's mark, he said:

"I am clearly of the opinion that 'Pur-X' is its dominating feature. That it was intended to be so is made apparent by an inspection of applicant's labels, where it is followed by the word 'brand.' In other words, applicant wants its products to be known as the 'Pur-X brand', and unquestionably that is the manner in which they would be called for by purchasers. Nor do I entertain any doubt that 'Purex' is the salient feature of opposer's corporate name. *The Asbestone Co.* v. *The Philip Carey Manufacturing Co.*, 41 App. D. C. 507. Obviously it is the only word in 'Purex Corporation, Ltd.', that serves to distinguish opposer from other corporations. It thus appears that applicant has appropriated opposer's name as the predominant feature of its trade-mark, unless it be held that the substitution of a hyphen for the letter 'e' in 'Purex' is a material change. So far as the Patent Office is concerned, I think that question finds a conclusive answer in the case of *Fyr-Fyter Co.* v. *William L. Barrell Co.*, 475 O. G. 688, 32 U. S. P. Q. 261, where it was held by this tribunal that 'Fire Fighter' is the corporate name of The Fyr-Fyter Company, notwithstanding the difference in spelling."

He then noted applicant's reliance upon the American Steel Foundries case and further noted that the word "Purex" had seldom been registered where the word "Simplex" referred to in the Foundries case had been in wide general use, and said:

"'Purex' is a fanciful word, registered as a trade-mark to only three concerns other than opposer, and not shown to be found in the name of any other corporation excepting that of applicant; whereas 'Simplex' was a part of some twenty corporate names, and occurred in about sixty registered trade-marks.

* * * * * * *

"Here, however, the appropriation of opposer's name is substantially complete, and 'the rule of the statute, by its own terms, is absolute and the proposed mark must be denied registration without more.'"

BOND ELECTRIC CORPORATION *v.* AUTOMATIC ELECTRIC COMPANY, Opposition No. 15,432.

In a decision rendered October 26, 1937 (159 Ms. Dec. 1007), *Assistant Commissioner Frazer* held that Automatic Electric Company, of Chicago, Ill., is entitled to register, as a trade-mark for insulated conductors, wires, etc., the mark consisting of the single word "Monotype", notwithstanding the prior use and registration by Bond Electric Corporation, of Jersey City, N. J., of a mark disclosing the picture of a double label at the top of each panel of which is printed the word "Bond" and beneath which is the notation "Safety Seal Mono-Cell", the latter words together with some other descriptive matter being disclaimed, as a trade-mark for batteries.

In his decision, after stating that the goods of the two parties are unquestionably of the same descriptive properties and the Examiner sustained the opposition on the authority of *Pilot Radio Corporation* v. *Westinghouse Electric & Manufacturing Co.*, 472 O. G. 747, which he deemed controlling, the Assistant Commissioner said:

"In my opinion that case is clearly distinguishable. It was there held that the word 'Pilotel' is confusingly similar to the registered marks 'Pilot' and 'Pilotone.' If in the instant case opposer's trade-mark were 'Mono-Cell' the decision referred to would be applicable, but such is not the fact. 'Mono-Cell' is but a minor feature of opposer's mark, is descriptive of opposer's goods, and is disclaimed in the registration. The predominant part of the mark is the word 'Bond', and I doubt that the purchasing public would attach the slightest trade-mark significance to the relatively unimportant and purely descriptive notation 'Mono-Cell', which constitutes the only feature of the mark to which applicant's mark bears even the faintest resemblance. Comparing opposer's mark as a whole with the mark sought to be registered, I am unable to believe there is any reasonable likelihood that confusion will result from their concurrent use on the goods to which they are respectively assigned."

WARREN DUNNELL *v.* HAL DE WAIDE, Cancellation No. 3026.

In a decision rendered October 29, 1937 (159 Ms. Dec. 1008), *Assistant Commissioner Frazer* held that Hal De Waide, of Portland, Oreg., was not entitled to register, under the act of 1905, the notation "Slip Away" as applied to paper toilet seat covers, and the registration which he had obtained should be cancelled.

In his decision, after stating that the notation "Slip Away" was associated in the registered mark with other words which are disclaimed, and noting the argument of the parties as to the descriptiveness or nondescriptiveness of the term in question, and also noting appellant's argument based on the decision in *In re Irving Drew Co.*, 54 App. D. C. 310, and stating that the doctrine announced in that case appeared to have been repudiated by the same court in the case of *The Kay & Ess Co.* v. *Coe*, 483 O. G. 229, 34 U. S. P. Q. 316, the Assistant Commissioner said:

"It is asserted in De Waide's brief that the seat covers in question 'neither slip away, nor are slipped away. They stay put in place until pulled or dragged off by the flushing of the toilet bowl.' That may be true; but merely because some force must be exerted to initiate the process of slipping, it does not follow that the article thus set in motion does not thereafter slip. I can think of no brief expression that more aptly describes this particular characteristic of sanitary seat covers than to say that they 'slip away' from the seat when the bowl is flushed. It is my opinion that any dealer in like merchandise has the right to use this and similar phrases to describe his goods, and that it is not therefore subject to exclusive appropriation. It follows that the registration here involved was improperly granted, and as Dunnell is shown to have been injured thereby the statute requires its cancellation."

EX PARTE KRAFT-PHENIX CHEESE CORPORATION, Serial No. 367,970.

In a decision rendered October 30, 1937 (159 Ms. Dec. 1011), *Assistant Commissioner Frazer* held that registration of a trade-mark for condensed milk was properly refused to Kraft-Phenix Cheese Corporation, of Chicago, Ill., where the labels showed only the names of another party, and that applicant had declined to make an affidavit that certain new labels were in use by it.

In his decision, after noting that the applicant had filed an affidavit in response to the Examiner's rejection, to the effect that it was the manufacturer of the goods and the company whose name appeared on the label was authorized to use the trade-mark on concentrated milk, and noting that new labels had been substituted bearing applicant's name but applicant had declined to comply with the request of the Examiner that an affidavit be filed stating that these new labels were in actual use by the applicant and stating further that counsel admitted that no such use had been made, the Assistant Commissioner said:

"Upon the record as presented I think the Examiner was amply justified in refusing the registration applied for. Only the owner of a trade-mark is entitled to its registration, and ownership can be acquired only through use. It appears quite conclusively that applicant had made no use of the mark in question at the time its application was filed; and the fact that someone else had applied the mark to goods of applicant's manufacture, as sole distributor or otherwise, can add nothing to applicant's claim of ownership."

EX PARTE AUTOMOBILE MUTUAL INSURANCE COMPANY OF AMERICA, Serial No. 333,213.

In a decision rendered October 30, 1937 (159 Ms. Dec. 1010), *Assistant Commissioner Frazer* held that Automobile Mutual Insurance Company of America, of Providence, R. I., is entitled to register, under the act of 1905, a trade-mark for a booklet which had issued annually.

In his decision, after stating that the Examiner refused registration because the publication was not serial in character and noting that while from year to year much of the same matter was contained in the booklet, other matter was included which was of interest to motorists, the Assistant Commissioner said:

"Other matter is included, however, of general interest to motorists, which is not repeated in successive issues, and which I consider sufficient to satisfy the requirement suggested by the Examiner that 'it is the substantial change of material with each issue which enables periodical publications to support trade-mark registration.'"

Then, after noting that both the Examiner and applicant had cited several cases, none of which was directly in point, he said:

"Upon the particular facts here presented I think applicant is entitled to have its mark registered."

TRADE-MARKS

OFFICIAL GAZETTE, NOVEMBER 30, 1937

[VOL. 484. No. 5]

The following trade-marks are published in compliance with section 6 of the act of February 20, 1905, as amended March 2, 1907. Notice of opposition must be filed within thirty days of this publication.

Marks applied for "under the ten-year proviso" are registrable under the provision in clause (b) of section 5 of said act as amended February 18, 1911.

As provided by section 1 of said act, a fee of ten dollars must accompany each notice of opposition.

Alcrosil

For Steel Products—Namely, Tubing for Corrosion or High Temperature Resisting Purposes and Not for Tool Steel Purposes.
Claims use since Aug. 24, 1937.

CLASS 14

Metals and Metal Castings and Forgings

Ser. No. 391,859. FANSTEEL METALLURGICAL CORPORATION, North Chicago, Ill. Filed Apr. 26, 1937.

Fasaloy

For Alloys of Precious, Semi-Precious, or Rare Metals, Containing Some or All of the Elements, Gold, Silver, Platinum, Palladium, Ruthenium, and the like.
Claims use since July 6, 1936.

CLASS 15

Oils and Greases

Ser. No. 392,641. E. F. HOUGHTON & CO., Philadelphia, Pa. Filed May 12, 1937.

CUT-MAX

For Cutting Oils.
Claims use since Apr. 23, 1937.

Ser. No. 396,712. EMERY INDUSTRIES, INC., Cincinnati, Ohio. Filed Aug. 24, 1937. Under 10-year proviso.

Emery

For Candles.
Claims use since 1840.

Ser. No. 397,277. CITIES SERVICE OIL COMPANY, Bartlesville, Okla. Filed Sept. 10, 1937.

BLUE CLUB MOTOR OIL

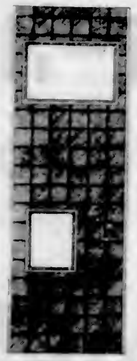
The words "Motor Oil" are disclaimed except as shown.
For Lubricating Oil For Motors and Engines.
Claims use since June, 1923.

Ser. No. 398,179. STANDARD OIL COMPANY OF NEW JERSEY, Wilmington, Del. Filed Oct. 5, 1937.

ALUMINECK

For Lubricating Greases.
Claims use since Sept. 9, 1937.

Ser. No. 398,180. STANDARD OIL COMPANY OF NEW JERSEY, Wilmington, Del. Filed Oct. 5, 1937.



ROLUBRICANT

For Lubricating Greases.
Claims use since Sept. 9, 1937.

CLASS 16

Paints and Painters' Materials

Ser. No. 397,260. R. H. MACY & CO, INC., New York, N. Y. Filed Sept. 9, 1937.

The drawing is lined for green. The representation of a label per se is disclaimed.
For Ready Mixed Paints, Paint Enamels, Varnishes, Varnish Stains, Paint Oils, Fillers, Lacquers.
Claims use since March, 1932.

Ser. No. 397,611. THE JOHN P. COCHRAN COMPANY, Cleveland, Ohio. Filed Sept. 21, 1937.

COLORLUX

For Ready Mixed Paints, Paint Enamels, Lacquers, and Varnishes.
Claims use since Sept. 1, 1937.

Ser. No. 398,060. JOSEPH SMIDT, Chicago, Ill. Filed Oct. 2, 1937.

SEE MORE

For Paints, Varnishes, and Enamels—Namely, Ready-Mixed Paint, Paint Paste, Paint in Powder Form, and Paint Enamels—and Polishes—Namely, Automobile and Furniture Polish.
Claims use since Aug. 1, 1936.

Ser. No. 398,384. OTTO C. BALTZ, doing business as Jackson Laboratories, Philadelphia, Pa. Filed Oct. 12, 1937.

JAXITE

For Automobile Polish.
Claims use since Aug. 13, 1937.

CLASS 17

Tobacco Products

Ser. No. 396,659. FRANCISCO ARANGO, JR., doing business as Tampa Cigar Co., Tampa, Fla. Filed Aug. 23, 1937.

TAMPA Luints

The word "Tampa" is disclaimed apart from the mark.
For Cigars.
Claims use since Aug. 2, 1937.

CLASS 19

Vehicles, Not Including Engines

Ser. No. 394,993. FLOREDA BABETTE LA PLANTE, New York, N. Y. Filed July 8, 1937.

For Bicycles.
Claims use since October, 1928.

CLASS 21

Electrical Apparatus, Machines, and Supplies

Ser. No. 393,959. P. R. MALLORY & CO., INC., Indianapolis, Ind. Filed June 11, 1937.

Vibrapack

For Electric Power Supply Devices of the Type Using a Vibratory Switch Current Interrupter Together With Voltage Transforming Means to Convert Electric Energy of One Voltage Into Electric Energy of Another Voltage.
Claims use since Apr. 21, 1937.

Ser. No. 394,047. PENN ELECTRIC SWITCH CO., Des Moines, Iowa. Filed June 14, 1937.

PENN

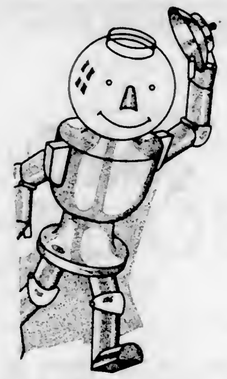
For Automatic Electric Switches, Particularly Pressure Operated, Float Operated, Vacuum Operated, and Temperature Operated Switches.
Claims use since Jan. 29, 1937.

Ser. No. 394,930. BOONTON RADIO CORPORATION, Boonton, N. J. Filed July 7, 1937.

XQ 437

For Mica Insulators for Electrical Use.
Claims use since June 29, 1937.

Ser. No. 396,248. WESTERN RAILROAD SUPPLY COMPANY, Chicago, Ill. Filed Aug. 10, 1937.



For Parkway Cable Sealing Compound Used for Sealing the Outlets for Electrical Cables and Protecting the Same from Dirt, Moisture, Corrosion, and Deterioration.
Claims use since August, 1913.

Ser. No. 396,391. ELECTRONIC LABORATORIES, INCORPORATED, Indianapolis, Ind. Filed Aug. 14, 1937.

VIBRAPAK

For Electric Vibrator-Type Power Supply Units Including D. C. to A. C. Converters and D. C. to A. C. Transformers.
Claims use since May 24, 1937.

Ser. No. 396,394. S. W. FARBER, INC., Brooklyn, N. Y. Filed Aug. 14, 1937.

For Electrically Heated Beverage Makers.
Claims use since Apr. 16, 1937.

Ser. No. 397,030. THE HOOVER COMPANY, North Canton, Ohio. Filed Sept. 2, 1937.

norca

For Electrically Operated Suction Cleaners.
Claims use since July 1, 1937.

Ser. No. 397,194. THE MAGNAVOX COMPANY, Fort Wayne, Ind. Filed Sept. 7, 1937.

Transradiant

For Electrically Illuminated Signs.
Claims use since Apr. 1, 1936.

Ser. No. 398,006. GENERAL CABLE CORPORATION, New York, N. Y. Filed Oct. 1, 1937.

RURALAY

For Bare and Insulated Electrical Wires and Cables.
Claims use since Sept. 1, 1937.

CLASS 22

Games, Toys, and Sporting Goods

Ser. No. 394,802. PLA-WOOD PRODUCTS CORPORATION, Cleveland, Ohio. Filed July 2, 1937.

No claim is made to the word "Official" apart from the mark or to the representation of the goods per se.

For Toy Paddle with Attached Elastic Cord and Ball.
Claims use since June 1, 1936.

Ser. No. 397,263. LOUIS MARX & COMPANY, INC., New York, N. Y. Filed Sept. 9, 1937.

SOAP BOX

For Toy Speedway or Racetrack and Miniature Toy Vehicles.
Claims use since Aug. 26, 1937.

Ser. No. 397,466. DONALD B. WURZBURG, INC., Grand Rapids, Mich. Filed Sept. 15, 1937.

WEE WINKIE TOGS

The word "Togs" is disclaimed except as shown.

For Dolls' Clothing—Namely, Dresses, Slips, Panties, Coats, and Capes.
Claims use since Aug. 28, 1937.

Ser. No. 398,303. MCLOUGHLIN BROS., INC., Springfield, Mass. Filed Oct. 9, 1937.

MAGIC DOLL

Applicant disclaims the word "Doll" apart from the mark.

For Dolls and Costumes Thereof.
Claims use since Sept. 27, 1937.

Ser. No. 398,394. JOE E. ELLEDGE, Colorado Springs, Colo. Filed Oct. 12, 1937.

Revance

(RE turn - - ad VANCE)

For Game Played with a Deck of Specially Prepared Cards.
Claims use since July 23, 1937.

Ser. No. 398,555. CHISHOLM-RYDER CO., INC., Niagara Falls, N. Y. Filed Oct. 16, 1937.

PREMAX

For Fishing Rods and Reels.
Claims use since May 1, 1933.

Ser. No. 398,662. MILTON BRADLEY COMPANY, Springfield, Mass. Filed Oct. 19, 1937.

FIVE STAR FINAL

For Board Games.
Claims use since Apr. 1, 1937.

Ser. No. 398,721. THE ENTERPRISE MANUFACTURING COMPANY, Akron, Ohio. Filed Oct. 20, 1937.

SIGNAL

For Floats for Fishing Tackle.
Claims use since Oct. 13, 1937.

CLASS 23

Cutlery, Machinery, and Tools, and Parts Thereof

Ser. No. 383,496. THE UNION FORK & HOE COMPANY, Columbus, Ohio. Filed Sept. 21, 1936.

For Hand Operated Tools—Namely, Axes, Lettuce Cutters, Thistle, Dock, and Weed Cutters, D-Handles for Tools, Manure Drags, Potato Drags, Phosphate Drags, Stone Drags, Lawn Edgers, Turf Edgers, Light and Heavy Forks, Alfalfa Forks, Asphalt Forks, Baling Forks, Ballast Forks, Barley Forks, Beet Forks, Clover Forks, Coal Forks, Coal Scoop Forks, Coke Forks, Cotton Seed Forks, English Digging Forks, Ensilage Forks, Fish Forks, Floral Spading Forks, Grain Forks, Hay Forks, Header Forks, Manure Forks, Mill Forks, Phosphate Forks, Potato Digging Forks, Pulp Forks, Shaving Forks, Spading Forks, Street Forks, Stone Forks, Stone Picker Forks, Tanners' Forks, Tar Forks, Vegetable Scoop Forks, Floral Garden Tools, Ice Chisels, Beet Hoes, Blackland Hoes, Boys' Hoes, Corn Hoes, Cotton Hoes, Cotton Chopper Hoes, Cultivator Hoes, Eye Hoes, Field Hoes, Floral Hoes, Garden Hoes, Grading Hoes, Grape Hoes, Grub Hoes, Handled Sprouting Hoes, Handled Square Eye Hoes, Ladies' Hoes, Mattock Hoes, Meadow Hoes, Mortar Hoes, Mortar Mixer Hoes, Nursery Hoes, Nurserymen's Hoes, Onion Hoes, Planter Hoes, Rhode Island Hoes, Riveted Hoes, Scuffle Hoes, Sprouting Hoes, Strawberry Hoes, Street Hoes, Sugar Beet Hoes, Thinning Hoes, Tobacco Hoes, Warren Hoes, Weeding Hoes, Whirlwind Hoes, Clam Hooks, Garbage Hooks, Manure Hooks, Nurserymen's Hooks, Phosphate Hooks, Potato Hooks, Refuse Hooks, Stone Hooks, Lawn Combs, Pokers, Asphalt Rakes, Brume Rakes, Clam Rakes, Curved Tooth Rakes, Dandelion Rakes, Flat Bow Rakes, Floral Rakes, Garden Rakes, Gravel Rakes, Lawn Rakes, Level Head Rakes, Malleable Rakes, Pine Needle Rakes, Road Rakes, Round Bow Rakes, Single Shank Rakes, Steel Rakes, Stone Rakes, Tar Rakes, Two-man Rakes, Wire Lawn Rakes, Seedling Setters, Scoops, Barn Floor Scrapers, Chicken House Scrapers, Deck Scrapers, Floor Scrapers, Ship Scrapers, Fire Shovels, Floral Shovels, Side Walk Cleaners, Sod Lifters, Concrete Spades, Hand Spades, Tool Handles and Parts Thereof, Garden Trowels, Nurserymen's Trowels, Transplanting Trowels, Dandelion Weeders, Hand Weeders, Onion Weeders.
Claims use since Dec. 22, 1934.

Ser. No. 388,443. FRED P. GLICK, doing business as Fabriform Steel Products Co., Bell, Calif. Filed Feb. 2, 1937.

FABRIFORM

For Complete Oil Re-Refineries Sold as a Single Unit, and Replacement Parts Therefor, Mining Apparatus and Equipment—Namely, Excavators, Conveyors, Ball Mills, Rod Mills, Classifiers, Mining Cars, Flotation Machinery, Amalgamators, and Custom-Built Special Mining Machinery, and Replacement Parts Therefor; Road Working Machinery and Equipment—Namely, Excavators, Scrapers, Graders, and Steam Shovels, and Replacement Parts Therefor; Steel- and Wood-Working Machinery and Replacement Parts Therefor; Manually Controlled Non-Electric Hoists and Jacks.
Claims use since Jan. 1, 1936.

Ser. No. 390,890. AMERICAN IRON & MACHINE WORKS COMPANY, Oklahoma City, Okla. Filed Apr. 3, 1937.

Applicant claims ownership of registered trade-mark of Ct. #216,830, issued Aug. 24, 1926.

The drawing is lined for red and blue.

For Oil Field Equipment Including: Bailers, Break-Out Blocks, Blow-Out Preventers, Core Barrels, Core Bits, Crown-Blocks, Cat-Heads, Draw-Works, Drilling Rigs, Drill Bits, Engine Bases, Engine Braces, Engine Pistons, Mud-Pump Valves, Inside Pipe-Cutters, Pipe Racking Apparatus, Pipe Swivels, Pipe-Tongs, Rocker Arms, Releasing Joints, Rotary Tables, Shale Separators, Sheaves, Water Cooling Apparatus for Brake-Drums, Water Softening Apparatus of a Mechanical Nature and Exclusive of Traps, for Introducing Chemicals to Boiler Feed Water, Whipstocks, Wrenches, Flow-Beams, Paraffin Removing Apparatus, Pressure Flow Apparatus for Wells, Sucker-Rod Couplings, Sucker-Rod Guides, Sucker-Rod Reciprocating Apparatus, Wall Packers, Well Pumps, Casing Heads, Tubing Supports, Tubing Heads, and Metal Portable Tool Houses.
Claims use since August, 1928.

Ser. No. 394,510. R. SEELIG & HILLE, Dresden, Germany. Filed June 25, 1937.

Reliance

For Automatic Bag and Infusion Bag Packaging Machine for Portioning Off, Filling, and Wrapping Bags.
Claims use since Mar. 3, 1937.

Ser. No. 395,782. RUTH ZWINGENBERGER, doing business as Helios-Wirkmaschinenzubehoer Zwingenberger & Co., Hohenstein-Ernstthal, Saxony, Germany. Filed July 23, 1937.

HELIOS

For Knitting Machine Parts.
Claims use since May 29, 1933.

Ser. No. 396,534. THE GAIRING TOOL COMPANY, INC., Detroit, Mich. Filed Aug. 18, 1937.

GAIR-LOCK

The word "Lock" is disclaimed from the word "Gair".

For Metal Working Tools Employing Removable Cutting Blades.
Claims use since July 1, 1937.

Ser. No. 397,107. JOHN BLUE, JR., Laurinburg, N. C. Filed Sept. 4, 1937.

The noun "Product" is disclaimed apart from the mark. The drawing is lined for blue.

For Farm Machinery—Namely, Fertilizer Sowers, Walking and Riding Plows, Planters, Harrows, Seeding Machines, and Machine Insecticide Sprayers and Dusters.
Claims use since Jan. 1, 1936.

Ser. No. 397,157. GUY E. STEWART, doing business as Stewart Blade Company, Brooklyn, N. Y. Filed Sept. 4, 1937.

Character

For Razor Blades.
Claims use since Sept. 1, 1937.

Ser. No. 397,603. AMERICAN MERCHANDISE CO. INC., New York, N. Y. Filed Sept. 21, 1937.

HYGLO

For Razor Blades.
Claims use since June 2, 1937.

Ser. No. 397,759. OTTO E. KRAUS, Chicago, Ill. Filed Sept. 24, 1937.

"STUDIO"

For Razor Blades.
Claims use since Aug. 9, 1937.

Ser. No. 397,892. THE AP PARTS CORPORATION, Toledo, Ohio. Filed Sept. 28, 1937.

Silver Streak

For Mufflers for Explosive Engines and Parts Thereof.
Claims use since Sept. 17, 1937.

CLASS 26

Measuring and Scientific Appliances

Ser. No. 391,716. H. A. THRUSH & COMPANY, Peru, Ind. Filed Apr. 22, 1937.

THRUSH

DUB-L WEAVE

For Neckwear Tie Linings, in the Piece, of Cotton, Mohair, Woolen, Rayon, or Other Materials, or a Combination Thereof.
Claims use since June 2, 1936.

352,541. (CLASS 42. KNITTED, NETTED, AND TEXTILE FABRICS.) M. J. MACK CORP., New York, N. Y. Filed Sept. 9, 1937. Serial No. 397,257.

Woolike

For Neckwear Tie Linings in the Piece Manufactured from Cotton, Rayon, Woolen, Mohair, and/or Other Kindred Materials, or a Combination of Either, or All.
Claims use since June, 1936.

352,542. (CLASS 46. FOODS AND INGREDIENTS OF FOODS.) MEEKER SUGAR REFINING COMPANY, Chicago, Ill., and Meeker, La. Filed Sept. 13, 1937. Serial No. 397,368.

KANDY KRYSTALS

For Sugar.
Claims use since 1929.

352,543. (CLASS 42. KNITTED, NETTED, AND TEXTILE FABRICS.) CHARLES P. COCHRANE COMPANY, Philadelphia, Pa. Filed Oct. 4, 1937. Serial No. 398,095.

Pebbleweave

For Carpets and Rugs.
Claims use since 1932.

352,544. (CLASS 39. CLOTHING.) GEORGE HESS CO. INC., New York, N. Y. Filed Oct. 16, 1937. Serial No. 398,574.

June Yardley

For Women's Dresses.
Claims use since Sept. 16, 1936.

352,545. (CLASS 39. CLOTHING.) GEORGE HESS CO. INC., New York, N. Y. Filed Oct. 16, 1937. Serial No. 398,575.

Babs Barclay

For Women's Dresses.
Claims use since Sept. 16, 1936.

352,546. (CLASS 39. CLOTHING.) GEORGE HESS CO. INC., New York, N. Y. Filed Oct. 16, 1937. Serial No. 398,576.

Fay Finchley

For Women's Dresses.
Claims use since Sept. 16, 1936.

TRADE-MARK REGISTRATIONS RENEWED

118,648. WATERPROOF OUTER CLOTHING—VIZ., RAIN-COATS. Registered September 25, 1917. BENJAMIN FLIGEL, New York, N. Y. Renewed September 25, 1937.

119,373. MATERIALS FOR GENERATION OF OXYGEN AND PEROXID OF HYDROGEN FOR INDUSTRIAL AND THERAPEUTICAL USES. Registered November 27, 1917. THE ROESSLER & HASSLACHER CHEMICAL CO., New York, N. Y. Renewed November 27, 1937, to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware, assignee by mesne assignments.

119,956. ELECTRICALLY-SELF-PROPELLED AUTOMOBILES, BODIES, RUNNING-GEARS, CHASSIS. Registered December 25, 1917. FORD MOTOR COMPANY, Highland Park, Mich. Renewed December 25, 1937, to Ford Motor Company, Dearborn, Mich., a corporation of Delaware, successor.

120,054. RUBBER ERASERS. Registered January 8, 1918. AMERICAN LEAD PENCIL CO., New York, N. Y. Renewed January 8, 1938, to American Lead Pencil Company, Hoboken, N. J., a corporation of New York.

120,064. CERTAIN NAMED TOILET PREPARATIONS. Registered January 8, 1918. A. BOURJOIS & CO., INC. Renewed January 8, 1938, to Bourjois, Inc., New York, N. Y., a corporation of New York, assignee.

120,245. TOILET SOAP. Registered January 29, 1918. A. BOURJOIS & CO., INC. Renewed January 29, 1938, to Bourjois Inc., New York, N. Y., a corporation of New York, assignee.

120,330. CERTAIN NAMED TOILET PREPARATIONS. Registered February 5, 1918. A. BOURJOIS & CO., INC. Renewed February 5, 1938, to Bourjois, Inc., New York, N. Y., a corporation of New York, assignee.

120,758. ENGINE, PUMP, AND COMPRESSOR OIL-RINGS MADE OF METAL. Registered March 5, 1918. MCQUAY-NORRIS MFG. CO., St. Louis, Mo., a corporation of Missouri. Renewed March 5, 1938.

121,042. INSECTICIDES, FUNGICIDES, AND DISINFECTANTS. Registered April 2, 1918. CALIFORNIA SPRAY CHEMICAL COMPANY, Watsonville, Calif. Renewed April 2, 1938, to California Spray-Chemical Corporation, Wilmington, Del., and Richmond, Calif., a corporation of Delaware, assignee.

121,242. CERTAIN NAMED PAPER AND STATIONERY. Registered April 23, 1918. J. C. BLAIR COMPANY, Huntingdon, Pa. Renewed April 23, 1938, to Western Tablet & Stationery Corporation, Dayton, Ohio, a corporation of Delaware, assignee.

121,252. SODIUM AND ALUMINUM SALTS FOR USE IN CLARIFYING WATER, MANUFACTURE OF PAPER, AND OTHER PURPOSES. Registered April 23, 1918. BOOTH CHEMICAL COMPANY, Townley, N. J. Renewed April 23, 1938, to Booth Chemical Company, Elizabeth, N. J., a corporation of New Jersey.

121,284. CERTAIN NAMED ELECTRICAL APPARATUS, MACHINES, AND SUPPLIES. Registered April 23, 1918, to FRANKEL CONNECTOR CO. INC., New York, N. Y., a corporation of New York. Renewed April 23, 1938.

121,397. FACE-POWDER, TOILET WATERS, ROUGE, LIP-STICKS, PERFUMES, EYEBROW-PENCILS, AND POMADES. Registered April 30, 1918. A. BOURJOIS & CO., INC. Renewed April 30, 1938, to Bourjois, Inc., New York, N. Y., a corporation of New York, assignee.

121,483. BUFFING AND POLISHING COMPOSITIONS. Registered April 30, 1918. THE NULITE POLISH COMPANY, INC., Brooklyn, N. Y., a corporation of New Jersey. Renewed April 30, 1938.

121,508. INNER TUBES FOR AUTOMOBILE-TIRES. Registered April 30, 1918. ROLAND V. SMITH. Renewed April 30, 1938, to R. V. Smith Supply Company, Oklahoma City, Okla., a corporation of Oklahoma, assignee.

121,511. SALTS, BASES, OR COMPOUNDS OF AMINOXYARSENOBENZENE OR OTHER DERIVATIONS OF OXYARLARSINIC ACIDS. Registered April 30, 1918. TAKAMINE LABORATORY, INC., New York, N. Y. Renewed April 30, 1938, to Sankyo Company, Ltd., Tokyo, Japan, a corporation of Japan, assignee.

121,512. SALTS, BASES, OR COMPOUNDS OF AMINOOXYARSENOBENZENE OR OTHER DERIVATIONS OF OXYARLARSINIC ACIDS. Registered April 30, 1918. TAKAMINE LABORATORY, INC., New York, N. Y. Renewed April 30, 1938, to Sankyo Company, Ltd., Tokyo, Japan, a corporation of Japan, assignee.

LABELS

REGISTERED NOVEMBER 30, 1937

50,399.—*Title:* NATURAL MINERAL EXTRACTS. For a Natural Mineral Tonic and Astringent. COLONIAL DRUG COMPANY, Tulsa, Okla. Published July 1, 1937.

50,400.—*Title:* PRE-VUE. For Canned Creaming Onions. CONTINENTAL FOODS CORP., Los Angeles, Calif. Published August 9, 1937.

50,401.—*Title:* "HENTAILS" WITH COCKTAILS. For Biscuits. DONNA BEACH FERGUSON, New York, N. Y. Published December 17, 1936.

50,402.—*Title:* RAG DARLING. For Wheat Flour. EAGLE MILLING COMPANY, Edmond, Okla. Published October 20, 1937.

50,403.—*Title:* ALL BUTTER. For Bread. CHARTON C. FRANTZ, doing business as The Frantz Co., Pittsburgh, Pa. Published September 10, 1937.

50,404.—*Title:* THE SUZY Q FROCK. For Frocks for Women. S. L. HOFFMAN & CO., INC., New York, N. Y. Published November 3, 1937.

50,405.—*Title:* HOPPE'S GUN CLEANING PATCHES. For Gun Cleaning Patches. FRANK A. HOPPE, INC., Philadelphia, Pa. Published September 30, 1937.

50,406.—*Title:* SKILBRU. For Beer. KAMM & SCHELLINGER COMPANY, INC., Mishawaka, Ind. Published September 28, 1937.

50,407.—*Title:* KEPHART'S VITAMINIZED OIL TREATMENT. For a Scientific Product for the Hair and Scalp. KEPHART LABORATORIES, Bozeman, Mont. Published September 4, 1937.

50,408.—*Title:* KROGER FRES-SHORE OYSTERS. For Oysters. THE KROGER GROCERY & BAKING COMPANY, Cincinnati, Ohio. Published January 1, 1936.

50,409.—*Title:* LAYER-PAK. For Canned Vegetables for Salads and Garnish. THE LARSEN COMPANY, Green Bay, Wis. Published October 7, 1937.

50,410.—*Title:* EASTSIDE SPARKLING ALE. For Ale. LOS ANGELES BREWING CO., Los Angeles, Calif. Published October 11, 1937.

50,411.—*Title:* IRISH SWEEPSTAKES. For a Game. MEYER D. MADWAY, Philadelphia, Pa. Published August 11, 1937.

50,412.—*Title:* PALMA. For a Mixture of Cottonseed, Corn, Peanut and Imported Olive Oil. MOOSALINA PRODUCTS CORP., Brooklyn, N. Y. Published September 1, 1937.

50,413.—*Title:* DEVIL'S FOOD PIE. For Pies. MOUNTAIN CITY MILL COMPANY, doing business as Chattanooga Bakery, Chattanooga, Tenn. Published September 17, 1937.

50,414.—*Title:* BREETHEX. For Liquid Breath Purifier. WILLARD H. NELSON, doing business as Willard Products Company, Moline, Ill. Published July 15, 1937.

50,415.—*Title:* FRESH JERSEY EGGS. For Eggs. NEW JERSEY FEDERATED EGG PRODUCERS COOPERATIVE ASSOCIATION, INC., Ocean Gate, N. J. Published July 2, 1937.

50,416.—*Title:* MAR-VELO PRODUCTS CO. (M. P. CO.) For a Cleaning Compound and Water Softener. MELVIN RALPH PAYNE, Fort Wayne, Ind. Published December 28, 1935.

50,417.—*Title:* MEL-BRO. For Long Island Duckling. PFAELZER BROTHERS, Chicago, Ill. Published October 12, 1937.

50,418.—*Title:* PRUICIDE. For a Leather Preserver. PRUDEN CHEMICAL COMPANY, Orlando, Fla. Published October 30, 1937.

50,419.—*Title:* TEXSUN. For Canned Grapefruit Juice. RIO GRANDE VALLEY CITRUS EXCHANGE, Weslaco, Tex. Published October 12, 1937.

50,420.—*Title:* BY REQUEST. For Chocolates. F. H. ROBERTS COMPANY, Cambridge, Mass. Published January 16, 1937.

50,421.—*Title:* VIGILANTE. For Whiskey. ROCKY MOUNTAIN BRANDS, INCORPORATED, Red Lodge, Mont. Published November 15, 1935.

50,422.—*Title:* MOUNTAIN ELK. For Bourbon Whiskey. ROCKY MOUNTAIN BRANDS, INCORPORATED, Red Lodge, Mont. Published October 15, 1937.

50,423.—*Title:* SILVER ANCHOR. For Bourbon Whiskey. ROCKY MOUNTAIN BRANDS, INCORPORATED, Red Lodge, Mont. Published October 15, 1937.

50,424.—*Title:* KUMMEL ADE. For a Soft Drink. P. B. ROMELFANGER, Minneapolis, Minn. Published August 15, 1934.

30,425.—*Title:* SALERNO SALTINE CRACKERS. For Salted Crackers. SALERNO-MEGOWEN BISCUIT COMPANY, Chicago, Ill. Published September 20, 1937.

30,426.—*Title:* SHEPARD'S FLY GUARD AND VETERINARY LINIMENT. For a Fly Guard and Veterinary Liniment. MARY LOUISA SHEPARD, Wilmington, N. C. Published October 20, 1937.

30,427.—*Title:* KING SOL—WISDOM BLENDED IN CIGARETTES. For Cigarettes. LEYCIADES L. SMITH, Vinita Park, Mo. Published August 5, 1937.

30,428.—*Title:* WILSON'S ISO-RUB. For Preparation for Bathing and Massaging Purposes. ANNA WILSON, doing business as Wilson Drug Company, Chicago, Ill. Published January 10, 1936.

PRINTS

REGISTERED NOVEMBER 30, 1937

16,588.—*Title:* WHITE BEAR BREAD. For Bread. HENRY BAEHR BAKERY, Wisner, Nebr. Published September 15, 1937.

16,589.—*Title:* GANGWAY! For Wheat Breakfast Food. THE CREAM OF WHEAT CORPORATION, Minneapolis, Minn. Published October 25, 1937.

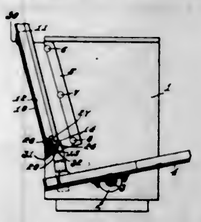
16,599.—*Title:* PITTSBURGH PAINTS, SMOOTH AS GLASS. For Paint. PITTSBURGH PLATE GLASS COMPANY, Pittsburgh, Pa. Published April 12, 1937.

16,600.—*Title:* KIN-KUR-THUM. For a Salve for Healing Peeps. CARL EDWARD SCHMITT, doing business as Mountain City Poultry Company, Altoona, Pa. Published May 3, 1937.

16,601.—*Title:* ENJOY ALTES LAGER. For Beer. TIVOLI BREWING COMPANY, Detroit, Mich. Published August 25, 1937.

REISSUES

NOVEMBER 30, 1937



20,559

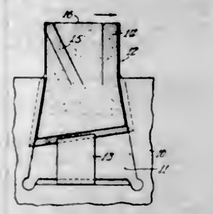
CHAIR BACK

Charles C. Adelsperger, deceased, late of Union City, Ind., by Union City Body Company, assignee, Union City, Ind.

Original No. 1,994,162, dated March 12, 1935, Serial No. 718,594, April 2, 1934, which is a division of Serial No. 598,231, March 11, 1932. Application for reissue November 20, 1936, Serial No. 111,861

6 Claims. (Cl. 155—184)

5. A chair structure comprising an upholstery carrying member generally rectangular in form and formed with an outwardly opening groove extending around at least three sides thereof, a resilient member positioned in said groove, means engaging the free ends of said resilient member for drawing said resilient member snugly into said groove and placing the same under tension therein, and a sheet of flexible covering material substantially co-extensive in size with said carrying member and having a portion fitting within said groove and embraced by said resilient member.



20,560

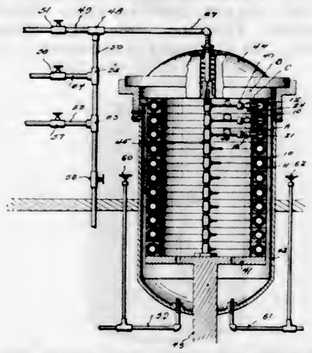
ABRASIVE SAW TOOTH

Fred Bley, Chicago, Ill., assignor, by mesne assignments, to The Carborundum Company, Niagara Falls, N. Y., a corporation of Delaware

Original No. 1,985,972, dated January 1, 1935, Serial No. 714,041, March 5, 1934. Application for reissue March 5, 1936, Serial No. 67,414

11 Claims. (Cl. 125—22)

1. An abrasive saw tooth comprising a flat relatively long body having one end providing a base portion adapted for mounting on a rotatable support with its other end projecting from the support and its outer extremity providing a grinding surface, all of said projecting portion except a narrow front edge section being of uniform thickness and bounded on opposite sides by parallel plane surfaces, said narrow front section being thicker than the main body thereof.



20,561

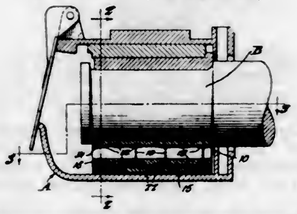
METHOD FOR CURING RUBBER ARTICLES

Floyd L. Bucy and Vela A. La Rock, Eau Claire, Wis.

Original No. 2,035,861, dated March 31, 1936, Serial No. 746,392, October 1, 1934. Application for reissue June 1, 1937, Serial No. 146,701

6 Claims. (Cl. 18—53)

4. The method of mold-vulcanizing a cord-reinforced pneumatic tire with an expansible core which comprises driving air from the core by conducting a non-deteriorating distending fluid other than air under pressure into the core while venting fluid from the core, stopping the venting of fluid upon the attaining of a predetermined difference of pressures between that of the distending fluid within the core and that of fluid flowing from the core, and retaining the distending fluid within the core to hold it and the tire distended, the said predetermined difference of pressures being effected after a sufficient flow of the said distending fluid through the core to wash substantially all of the air therefrom.

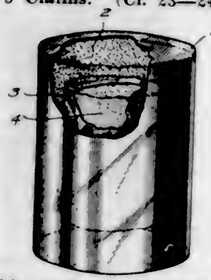


20,562

JOURNAL LUBRICATOR

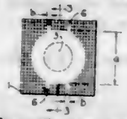
Homer B. Cunningham, Connellsville, and James William Tucker, Pittsburgh, Pa.

Original No. 1,943,298, dated January 16, 1934, Serial No. 642,796, November 15, 1932. Application for reissue December 27, 1935, Serial No. 56,376



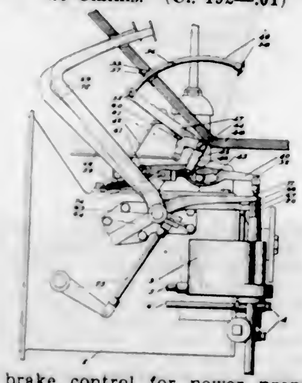
8 Claims. (Cl. 308—87)

8. A lubricator of the character described comprising a peripherally closed hollow flexible lubricant applicator of material suitable for conveying lubricant to and wiping it onto a moving surface in contact with the applicator and which



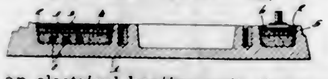
surface tends upon movement to cause the applicator to rotate, and flexible tension means connected with the applicator at opposed portions thereof and extending across the space therewithin and maintaining such opposed portions against separation to such an extent of separation as would permit the applicator to rotate due to movement of said surface.

20,563
METHOD OF PACKING ACID SULPHATES AND THE LIKE COMPOUNDS
Leo Löwenstein, Berlin-Wilmersdorf, Germany
Original No. 2,020,072, dated November 5, 1935, Serial No. 733,129, June 29, 1934. Application for reissue February 18, 1937, Serial No. 126,319½. In Germany September 1, 1930
5 Claims. (Cl. 23—240)



3. A durable package of sulphates having an acid reaction and being capable of destroying the ordinary cellulosic packing material comprising an outer container having an alkali metal carbonic acid salt capable of reacting with said sulphate, an inner container of organic sheet packing material of such character as to be destroyed by sulphuric acid evolved by the reaction of said acid sulphate with water, sub-divided acid sulphate in said inner container and completely surrounded thereby, said inner container being completely surrounded by said carbonic acid salt.

20,564
PRODUCT PACKAGING
Leroy L. Salfisberg, South Orange, N. J., assignor to Ivers-Lee Company, Newark, N. J., a corporation of Delaware
Original No. 2,012,405, dated August 27, 1935, Serial No. 737,721, July 31, 1934. Application for reissue May 20, 1936, Serial No. 80,786
13 Claims. (Cl. 206—46)

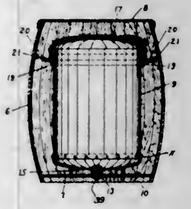


13. A spot window display package for a pellet or like commodity unit comprising, a flat envelope composed of two layers of transparent heat sealable coated cellophane or the like, joined together by fused thermo-plastic material and interlocking minute deformations throughout their opposed surfaces except for a central spot, said spot remaining transparent, said deformations and thermo-plastic material holding together said layers and forming a stiffened substantially flat flange, relatively translucent to light and securing the pellet in place between the layers at said central spot and providing for the reflection of light to produce a stippled sheen effect surrounding said central spot, said pellet being clearly visible at the central transparent spot.

20,565
COMBINED CLUTCH AND BRAKE CONTROL
Edwin G. Staude, Minneapolis, Minn.
Original No. 1,447,008, dated March 6, 1923, Serial No. 81,468, March 1, 1916. Renewed February 27, 1919, Serial No. 279,600. Application for reissue November 23, 1934, Serial No. 754,523
26 Claims. (Cl. 192—.01)

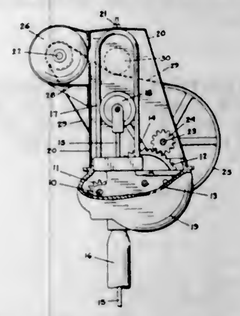
1. A brake control for power propelled vehicles comprising a pedal, an accelerator rod actuated thereby, a fluid circulating system, a brake operating means therein, a valve controlling the flow of fluid through said system, the initial movement of said pedal operating said valve to cut off the flow of fluid through said system, the release of said pedal allowing the movement of said valve to open the passage through said system and actuate said brake-operating means.

20,566
ELECTRICAL HEATING UNIT
Edwin L. Wiegand, Pittsburgh, Pa.
Original No. 1,994,676, dated March 19, 1935, Serial No. 698,323, November 16, 1933. Application for reissue July 29, 1935, Serial No. 33,743
11 Claims. (Cl. 219—25)



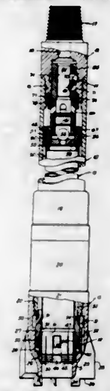
4. In an electrical heating unit, the combination of a heated member having a recess therein, an electrical resistance heating element disposed within said recess, a thin layer of cement disposed between the heating face of the element and walls of the recess and forming a mechanical and thermal bond therebetween, and a metal sheath enclosing said heating element except for the heating face thereof.

PATENTS



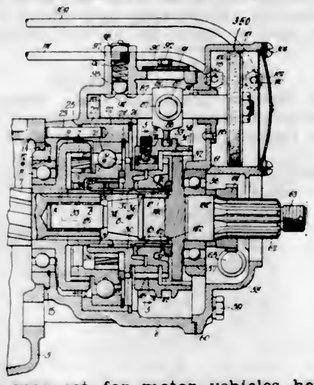
GRANTED NOVEMBER 30, 1937

2,100,309
RETURNABLE SHIPPING CONTAINER
Robert C. Bender, Davenport, Iowa
Original application September 29, 1934, Serial No. 746,069. Divided and this application May 14, 1936, Serial No. 79,657
3 Claims. (Cl. 217—72)



1. A shipping package, comprising an outer container, an inner cylindrical container, including a dish-shaped bottom provided with openings for drainage, a cover of inverted dish-shape for said container, similar to said bottom and adapted for interchangeable use therewith, means for holding said bottom and the bottom of the outer container in spaced relation, means for detachable connection of the bottom of the inner container with the bottom of the outer container, and connections between the upper end of the inner container capable of adjustment to conform with the spacing between said containers.

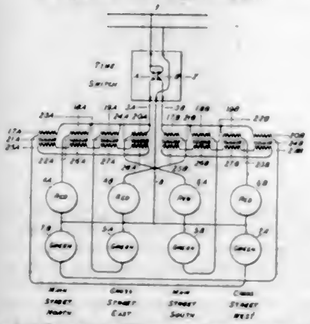
2,100,310
POWER TAKE-OFF
John R. Betts, Kearney, Nebr.
Application May 17, 1937, Serial No. 142,969
4 Claims. (Cl. 290—55)



4. An attachment for windmills of the kind having gearing driven by a wind wheel and a helmet for covering the windmill gearing, said attachment including a shaft having a gear adapted to mesh with a gear of the windmill gearing, a generator adapted to be secured to the windmill helmet on the outer side thereof, said generator including a shaft in parallel relation with the first said shaft of said attachment, and a connection between said two shafts whereby the first said shaft will drive said generator.

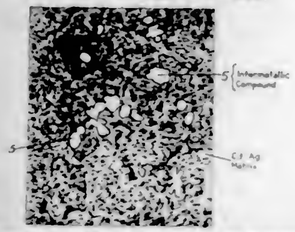
2,100,311
CORE DRILL
Alfred C. Catland, Alhambra, Calif., assignor to Globe Oil Tools Company, Los Nietos, Calif., a corporation of California
Application April 1, 1935, Serial No. 14,120
16 Claims. (Cl. 255—72)

1. In a core drill having a barrel and a core forming cutting head, the combination of a shiftable spring urged core recovering element, a sleeve positioned in the element to hold the element inoperative and adapted to readily pass the core, and spring means for moving the element out of engagement with the sleeve after the passage of the core through the element.



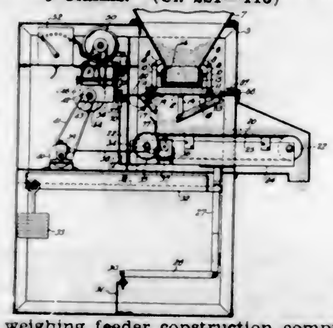
2,100,312
TRANSMISSION
Thomas L. Fawick, Akron, Ohio, assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application March 13, 1935, Serial No. 10,769
14 Claims. (Cl. 74—332)

1. A gear set for motor vehicles having, in combination, an internal gear, a composite gear having external teeth meshing with the internal teeth of said internal gear, a first driven member



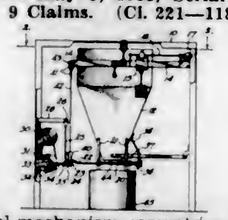
having external teeth meshing with the internal teeth of said composite gear, a first shaft fixed to said internal gear and having an extension extending through said internal gear, said composite gear and said first driven member, a bearing supporting the composite gear and located externally of the composite gear and in radial alignment with the internal teeth of said composite gear, bearing means carried by the extension of said first shaft and supporting said first driven member, said last bearing means being located internally of said first driven member and in radial alignment with the external teeth of the first driven member, a second driven member fixed on the extending end of the extension of said first shaft, a second shaft, and means for connecting said first and second driven members selectively to said second shaft.

2,100,313
TRAFFIC CONTROL SYSTEM
Alan S. Fitz Gerald, Wynnewood, Pa.
Application December 21, 1933, Serial No. 703,342
In Great Britain December 23, 1932
7 Claims. (Cl. 177—337)



1. In a traffic signalling system for a highway intersection, electric stop and go signals, a circuit for said stop signal, a second circuit for said go signal, means for intermittently and simultaneously energizing said circuits to an extent sufficient to render the said signals operative, and an impedance device connected in said circuits, said device having minimum impedance when both said circuits are energized, but presenting a substantially greater impedance to one of said circuits when the other circuit is deenergized, whereby, when said stop signal fails to function, said go signal is rendered inoperative.

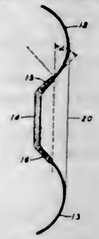
2,100,314
LINER FOR BEARINGS
Oscar E. Harder, Columbus, Ohio, assignor, by mesne assignments, to Federal-Mogul Corporation, Detroit, Mich., a corporation of Michigan
Application November 5, 1934, Serial No. 751,546
10 Claims. (Cl. 308—242)



1. A bearing material comprising essentially a matrix consisting of cadmium with silver in solid solution therein, in combination with small hard particles of an intermetallic compound including one of said elements dispersed throughout said matrix, the silver being present in an appreciable amount not exceeding 15 per cent by weight of the balance of the metal in the alloy.

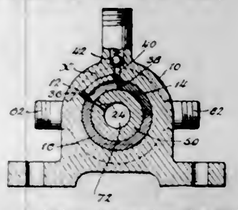
2,100,315
WEIGHING FEEDER
Elmer E. Harper, Kansas City, Mo.
Application May 27, 1935, Serial No. 23,720
6 Claims. (Cl. 221—118)

1. A weighing feeder construction comprising, in combination with a material-supply container, material-feeding mechanism for feeding material from said container, a scales mechanism, a conveyor supported on said scales mechanism and operating to deliver the material as fed thereto by said feeding mechanism, an actuating means and a control member actuated by fluctuations in said scales mechanism for effecting such regulation of the operation of said feeding mechanism as will maintain the scales in balanced condition, said control member being mounted for intermittent engagement with said actuating means and feeding mechanism while free to move between successive driving impulses for allowing said control member entirely idle and independent adjusting movement in response to fluctuations of said scales mechanism.



2,100,316
WEIGHT CONTRCLLED FEEDING MEANS
Elmer E. Harper, Kansas City, Mo.
Application May 9, 1935, Serial No. 20,599
9 Claims. (Cl. 221—118)

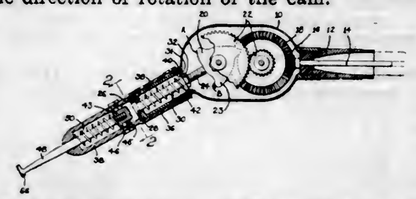
1. Control mechanism comprising, in combination with material-feeding mechanism, scales apparatus including a scale beam in cooperative relation to said feeding mechanism for responding directly to variations in the feeding operation, a movable driven member forming a part of said feeding mechanism and provided with an abutment element, an actuating means provided with a reciprocating abutment element in spaced relation to said first element, and a control element responsive to fluctuations of said beam and



located between said first elements for constituting a variable drive abutment between said actuating means and said movable member.

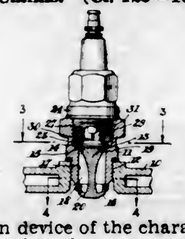
2,100,317
BOW
Clarence N. Hickman, Jackson Heights, N. Y.
Application June 22, 1935, Serial No. 27,890
12 Claims. (Cl. 124—23)

1. A bow having a handle portion, reflexed limbs forming an abrupt forward angle with the handle portion and a string connecting the tips of the limbs and resting on the belly of the active bending portions of the limbs.



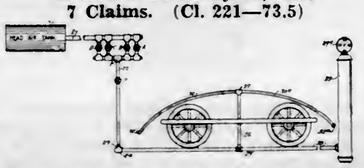
2,100,318
FUEL INJECTOR PUMP
John W. Berhman, Lincoln Park, and Raymon L. Robiolio, Paterson, N. J., assignors, by direct and mesne assignments, of forty percent to Federal Industrial Corporation, Paterson, N. J., a corporation of New Jersey, and sixty percent to Charles W. Brooks, Montclair, N. J.
Application October 31, 1935, Serial No. 47,534
7 Claims. (Cl. 103—145)

1. In a pump of the character described, a casing provided with an annular pump chamber concentric about its axis, complementary pumping parts disposed in said chamber and each being in the form of a segment of a ring concentric about said axis, one of said parts having a sliding fit in said chamber for rocking movement about said axis relatively with respect to the other part, said pump being provided with an inlet passage for the admission of liquid into said chamber between adjacent ends of said parts, said pump being provided with an outlet passage for the expulsion of the liquid from between said ends, means for controlling the volume of liquid expelled through said outlet passage for each stroke of said rocking part, and means for imparting rocking movement to said one of said parts.



2,100,319
DENTAL OR SURGICAL INSTRUMENT
Harold J. Brown and George E. Farrell, Dorchester, Mass.
Application June 7, 1932, Serial No. 615,893
4 Claims. (Cl. 32—61)

2. A dental or surgical instrument of the class described comprising a casing, a cam in the casing, a cam follower reciprocated by the cam, a tool holder reciprocated by the cam follower, the cam having a projection with a gradual rise in one direction and a steep rise in the other direction to permit change of the character of the reciprocation of the tool holder depending on the direction of rotation of the cam.



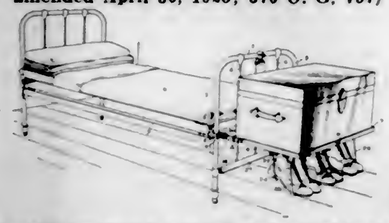
3. In a dental instrument, the combination with a casing to be held in the operator's hand and a tool holder reciprocable with respect to the casing, of an elevator tool carried by the holder to reciprocate on its longitudinal axis, the elevator tool having a shank and a thin walled operating portion of sufficiently small dimensions to enter the crevice between a root and the alveolar socket, whereby the tool may be worked into the crevice to loosen the root without the application of lateral forces on the tool.

2,100,320
SPARK PLUG
George M. Browning, Rutherford, N. J.
Application November 16, 1934, Serial No. 753,328
Renewed February 25, 1937
12 Claims. (Cl. 123—169)

1. An ignition device of the character described comprising a casing the upper end of which is provided with means for holding a spark-plug, formed with a chamber in said casing having upper and lower transverse walls, the upper end wall of which is provided with a passage for gas and the lower end wall thereof having a passage for gas of relatively large area.

2,100,321
TIRE INFLATION DEVICE
James H. Cox, Los Angeles, Calif.
Application July 17, 1933, Serial No. 680,820
Renewed February 23, 1937
7 Claims. (Cl. 221—73.5)

1. In a tire inflating and deflating mechanism, the combination of a source of pressure fluid, a reservoir, a pipe line connecting said source and reservoir, a plurality of sets of fluid-conducting pipes adapted to be detachably connected with the



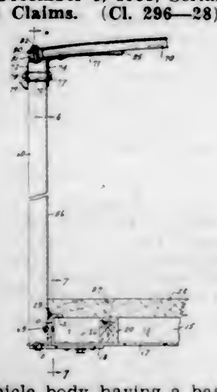
tires, and branch pipes connecting the said pipe line with the respective sets of fluid-conducting pipes, for the purpose specified.

2,100,322

FOLDING TRUNK LOCKER AND SHOE RACK

Raymond Dailey, United States Army

Application June 19, 1935, Serial No. 27,397
1 Claim. (Cl. 211—86)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



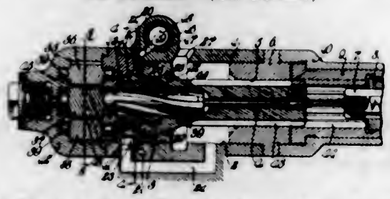
A combined trunk support and adjustable shoe rack adapted to be mounted on a bed having uprights and a cross member connecting said uprights, said combined structure consisting of a trunk locker frame pivotally mounted on said uprights, supporting arms pivotally mounted on opposite sides of said frame at their upper ends adapted to be removably mounted at their lower ends on said cross member to support the locker frame in its horizontal position and a shoe rack consisting of parallel shoe supporting loops pivotally suspended beneath said frame and supported thereby and adapted to be swung out into shoe displaying position or back into shoe concealing position and means of securing said loops in either of said positions.

2,100,323

AUTOMOTIVE TRUCK BODY

Benjamin F. Fitch, Greenwich, Conn., assignor to Motor Terminals Company, New York, N. Y., a corporation of Delaware

Application December 6, 1933, Serial No. 701,170
2 Claims. (Cl. 296—28)



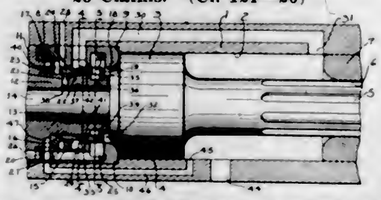
1. In a vehicle body having a base and sheet metal side wall panels extending upwardly therefrom and having upright external braces connecting adjacent panels, a roof carried by said side walls comprising a sheet of corrugated metal with the lengths of the valleys and ridges extending transversely of the body, a cornice structure comprising an outwardly sloping plate secured to the underside of said roof and extending inwardly over the interior of the body from the plane of the panels and providing horizontally facing ventilation openings between the plate and the corrugations of said roofing, and downwardly extending flanges carried by said plate depending in embracing relation to the upper ends of the braces and the upper margins of the panels respectively, said outwardly sloping plate extending inwardly, as aforesaid, a distance which, is several times as great as the depth of the valleys in the corrugated sheet.

2,100,324

ROCK DRILL ROTATION MEANS

Elmer G. Gartin, Claremont, N. H., assignor to Sullivan Machinery Company, a corporation of Massachusetts

Application April 26, 1934, Serial No. 722,571
14 Claims. (Cl. 121—7)



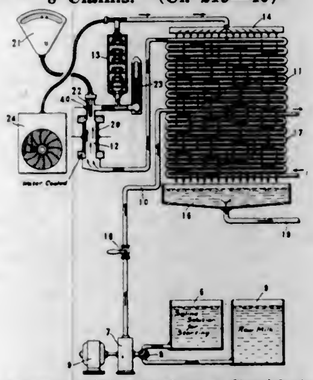
1. In a rock drill, a pressure fluid actuated hammer motor comprising a cylinder and a piston reciprocable therein, said piston adapted to deliver impact blows to the shank of a drill steel, and drill steel rotation means comprising a rifle bar interlocked with the piston, a rotary lock for controlling rifle bar rotation and including a rotary locking element fixed to said rifle bar, means for supplying pressure fluid to said rotary lock to lock said rotary locking element against rotation during the piston stroke in one direction and for connecting said lock to exhaust to release said rifle bar for free rotation during the other piston stroke, said rifle bar when held against rotation effecting rotation of the piston during one piston stroke, and means for transmitting the rotary motion of the piston to the drill steel.

2,100,325

PRESSURE FLUID MOTOR

Elmer G. Gartin, Claremont, N. H., assignor to Sullivan Machinery Company, a corporation of Massachusetts

Application November 1, 1934, Serial No. 751,012
25 Claims. (Cl. 121—26)



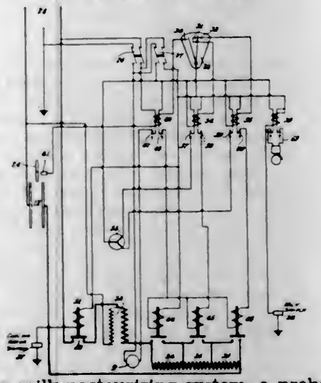
1. In a pressure fluid motor, a cylinder having a bore, a piston reciprocable therein, and fluid distribution means for effecting reciprocation of said piston including a valve chest having a valve chamber, a fluid actuated fluid distributing valve movably mounted in said valve chamber, and passage means controlled by the valve for supplying pressure fluid to the opposite ends of the cylinder bore and including passage means in said valve for providing a double fluid flow past the external and internal surfaces of the valve to the opposite ends of the cylinder bore.

2,100,326

PASTEURIZATION OF MILK

Benjamin E. Getchell, Plainville, Conn., assignor to The Trumbull Electric Manufacturing Company, Plainville, Conn., a corporation of Connecticut

Application March 21, 1936, Serial No. 70,170
8 Claims. (Cl. 219—40)



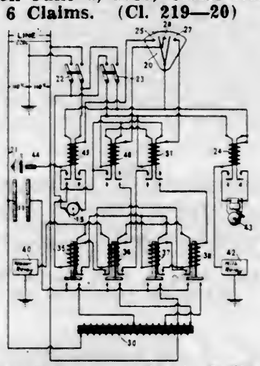
1. In a pasteurizing system, a liquid circulating system including a heating chamber having electrodes and a liquid heated preheater, a motor driven pump for forcing a liquid through said circulating system, manually controlled means for synchronizing the rate of flow of the liquid with the demand of a bottling machine, means for applying an alternating current to the electrodes for heating the liquid forced through the heating chamber, means for increasing and decreasing the value of the current passing through the heating chamber including a number of resistances, one of which is normally in the heating circuit, and the others out of the heating circuit, means controlled by the temperature of the heated liquid for cutting any or all of the resistances in or out of the heating circuit.

2,100,327

PASTEURIZING SYSTEM

Benjamin E. Getchell, Plainville, Conn., assignor to The Trumbull Electric Manufacturing Company, Plainville, Conn., a corporation of Connecticut

Application May 16, 1936, Serial No. 80,034
12 Claims. (219—20)



1. In a milk pasteurizing system, a preheating heat regenerative device, a heating chamber and means for delivering the heated liquid to the preheater, a motor driven pump for forcing liquid through the preheater and the heating chamber, means for controlling the rate of flow and thermostatically controlled means for applying an alternating current to the heating chamber, said means including an induction regulator and a number of relays together with a contacting device controlling the circuits through the relays to stop the pump and decrease the voltage when the temperature of the heated liquid falls below a predetermined minimum and start the pump when the liquid in the heating chamber falls below a predetermined level and again stop the pump when the liquid in the heating chamber rises to a predetermined level and repeat such cycle until the temperature of the heated liquid reaches a predetermined value.

2,100,328

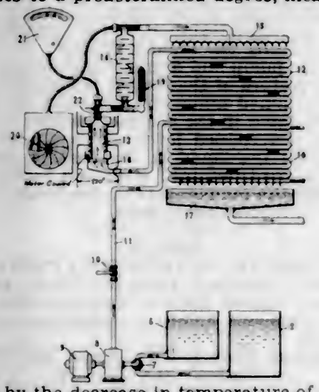
ELECTRICAL PASTEURIZING PROCESS

Benjamin E. Getchell, Plainville, Conn., assignor to The Trumbull Electric Manufacturing Company, Plainville, Conn., a corporation of Connecticut

Application June 1, 1936, Serial No. 82,700
6 Claims. (Cl. 219—20)

1. A pasteurizing apparatus including an electric heater having a conduit with a heating chamber having spaced electrodes, means for applying alternating current to said electrodes, means for passing a liquid through said heater, means for inductively changing the voltage supply to said electrodes, and means responsive to the temperature of the liquid which has passed through the heater for controlling said voltage changing means, said last mentioned means including a selective contactor for increasing the voltage on the electrodes when the temperature of the liquid falls a small amount below a predetermined value and another selective contactor for decreasing the voltage on the electrodes when the temperature of the liquid rises a small amount above said predetermined value, said voltage changing means including an auto-transformer having taps for voltages a small amount above and below that of line voltage and also a tap for applying a voltage substantially below line voltage to said electrodes.

2,100,329



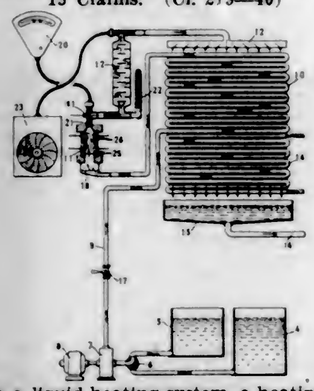
PASTEURIZING SYSTEM, ETC.

Benjamin E. Getchell, Plainville, Conn., assignor to The Trumbull Electric Manufacturing Company, Plainville, Conn., a corporation of Connecticut

Application June 6, 1936, Serial No. 83,839
11 Claims. (Cl. 219—40)

1. In a pasteurizing system, a heating chamber having three pairs of electrodes, two of which are

normally in circuit, means for forcing liquid through said chamber, means controlled by the increase in temperature of the liquid as it leaves the chamber for automatically cutting out one pair when the temperature of the treated liquid increases to a predetermined degree, means con-

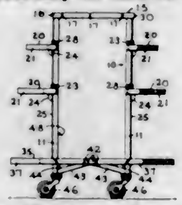


trolled by the decrease in temperature of the liquid as it leaves the chamber for automatically applying current to the third pair of electrodes when the temperature decreases a predetermined amount, and means for automatically controlling the rate of flow of liquid through the heating chamber.

2,100,330
PASTEURIZING APPARATUS

Benjamin E. Getchell, Plainville, Conn., assignor to The Trumbull Electric Manufacturing Company, Plainville, Conn., a corporation of Connecticut

Application June 6, 1936, Serial No. 83,840
15 Claims. (Cl. 219—40)



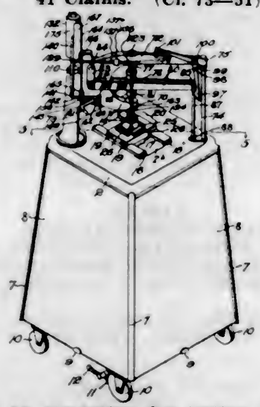
1. In a liquid heating system, a heating chamber having at least two pairs of electrodes, means for applying alternating current to the pairs of electrodes, thermostatically controlled means for varying the voltage applied to one pair of electrodes while maintaining the voltage applied to another pair and means for forcing liquid through the heating chamber.

2,100,331
RACK

Julius B. Graham, Shubuta, Miss.

Application November 21, 1936, Serial No. 112,165
7 Claims. (Cl. 211—137)

1. In a rack of the class described, a pair of spaced-apart frame members, each comprising a pair of leg portions and a bridge portion joining the upper ends of said leg portions; a top plate extending over each of said bridge portions and having a downturned rim extending over a section of said leg portions and bridge portions; means for securing said top plate to said frame members; a plurality of shelves extending out-

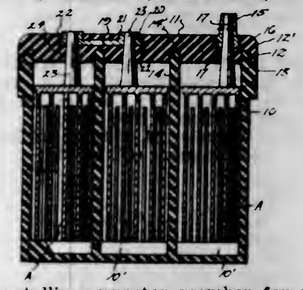


wardly beyond the vertical plane of said top plate; means for securing said shelves to said leg portions; a pair of horizontally-disposed cross members, one of each extending from one leg to the other leg of each of said pair of frame members and secured thereto; and a bottom plate spaced below said shelves and disposed upon said cross members.

2,100,332
WEAR TESTING, MEASURING, AND RECORDING APPARATUS AND METHOD

Edgar F. Hathaway, Wellesley, and Walter Bixby, Dorchester, Mass.

Application December 13, 1934, Serial No. 757,358
41 Claims. (Cl. 73—51)



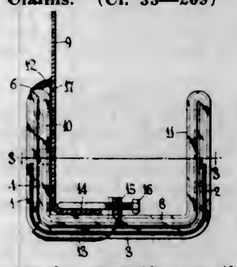
16. In an apparatus for testing the wearing qualities of floor coverings, fabrics and the like, a plate-like holder for a test specimen to be examined, a supporting spider for said holder having means for guiding the holder for movement relative to the spider and in the plane of the test specimen, guide means whereon the spider is bodily movable in a parallel plane but angularly with respect to the first mentioned movement, controlling cam means and drive connections for the holder, and associated cam means and drive connections for the spider, said two cam means being shaped, constructed and arranged with respect to each other to move the holder and test specimen with a predetermined compound movement alternately in one and the reverse directions along a recurring closed path.

32. A method of testing the wearing qualities of floor coverings, fabrics and the like comprising supporting and moving a test specimen in a predetermined sinuous closed path described alternately in opposite directions and in its own plane, and intermittently impacting and compressing successive portions of a total test surface of the moving specimen alternately during movement of the respective portion in one and the opposite directions in said path.

2,100,333
STORAGE BATTERY

Jack W. Hess, Dallas, Tex., assignor, by direct and mesne assignments, to The Richardson Company, a corporation of Ohio

Application March 22, 1934, Serial No. 716,848
3 Claims. (Cl. 136—124)

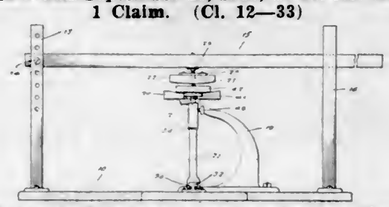


3. A metallic connector member for a multicell storage battery of a type having a single integral cover, said connector having an elongated body portion adapted to be embedded in the material of a cover and to bridge the space between cells, a peripheral flange portion located at the lower edge of said body portion, and thick walled extensions rising from the upper face of said body portion at each end thereof, said extensions and said body portion having continuous conical perforations therethrough to accept the tapered lugs of plate assemblies.

2,100,334
INDICATOR

Erwin C. Horton, Hamburg, N. Y., assignor to Trico Products Corporation, Buffalo, N. Y.

Application May 1, 1936, Serial No. 77,457
5 Claims. (Cl. 33—209)

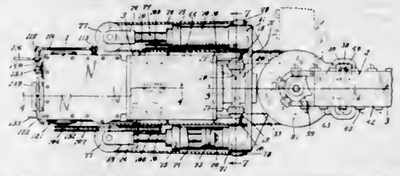


1. An indicator for mounting on the instrument panel of motor vehicles, or the like, comprising, in combination with the instrument panel, a tubular indicator body of substantially U-shape providing front and back upright legs, an indicating liquid contained within the body for registering an indication in the front leg, means for mounting the indicator body on the instrument panel with the front and back legs straddling the latter, and an equalizing passage connecting the upper portions of the upright legs and conforming substantially in shape to that of the tubular indicator body to straddle the instrument panel therewith.

2,100,335
SHOE REPAIR DEVICE

Roy L. James, North Platte, Nebr.

Application September 10, 1935, Serial No. 39,969
1 Claim. (Cl. 12—33)



A device of the character described, a pedestal, a last plate supported by the pedestal and provided with a depression, a lever, supporting means for the lever disposed at one side of the last plate and to which one end of the lever is pivoted, a pressure plate on the lever for movement therewith into and out of cooperative position relative to the last plate and cooperable with the depression in the last plate for molding the shoe shank into shape to provide a metatarsal support, a pair of welt plates disposed on each side of the last plate, supporting standards for the welt plates, means securing the welt plates on the supporting standards for tilting movement in either of two directions only, a fixed guide rail for each standard, and interengaging means on said guide rail and standard whereby the latter is trained to move in a fixed path laterally toward and away from said pedestal.

2,100,336
MINING APPARATUS

Joseph F. Joy, Claremont, N. H., assignor to Sullivan Machinery Company, a corporation of Massachusetts

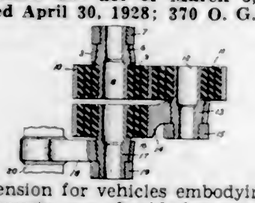
Application November 14, 1935, Serial No. 49,781
35 Claims. (Cl. 262—28)

1. In a mining apparatus, a portable base embodying a vertically tiltable frame, a tiltable support mounted on the forward end of said frame at the forward end of said base to rock with respect thereto, a kerf cutter carried by said support and having orbitally movable cutting elements, said kerf cutter swingable about its pivot to cut a plane kerf in a mine wall, and power operated devices connected to said tiltable support for rocking the latter relative to said frame and for vertically tilting said frame, said power operated devices common both to support rocking and frame tilting.

2,100,337
ZIRCONIUM OXIDE OPACIFIER AND METHOD OF MAKING SAME

Charles J. Kinzie, Niagara Falls, N. Y., assignor to The Titanium Alloy Manufacturing Company, New York, N. Y., a corporation of Maine

No Drawing. Application June 22, 1935, Serial No. 27,869
9 Claims. (Cl. 106—36.2)



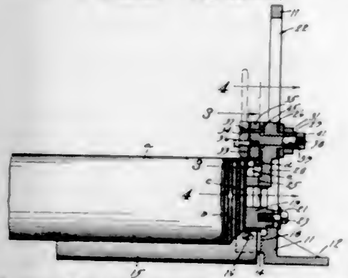
1. The method of making a vitreous enamel white opacifying composition which comprises

electro-thermally converting without fusion zirconium-containing materials mixed with a carbonaceous reducing agent to elimination of substantially all the silicon therein, heating the resulting product to oxidation to form a product composed chiefly of zirconium oxide but also containing undesired impurities, then heating said product to about 950° to 1050° C. in the presence of chlorine to reduce and volatilize the impurities including substantially all the iron and titanium, and finally calcining the residual product to eliminate substantially all the chlorides therefrom.

2,100,338

SUSPENSION FOR VEHICLES

Harry A. Knox, Washington, D. C.
Application February 15, 1937, Serial No. 125,791
7 Claims. (Cl. 267—21)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

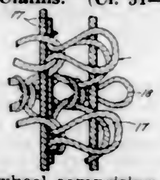


1. A suspension for vehicles embodying torque resisting elements, one of said elements connected to the load carrying member, another of said elements connected to the load, the third of said elements intermediate the first two elements to have an angular movement equal to the sum of the movements of the other two elements and connecting members from the third element to each of the other two elements.

2,100,339

OPENING DEVICE

Henry W. Lindgren, Waukegan, Ill., assignor to American Can Company, New York, N. Y., a corporation of New Jersey
Application August 11, 1934, Serial No. 739,487
5 Claims. (Cl. 30—2)

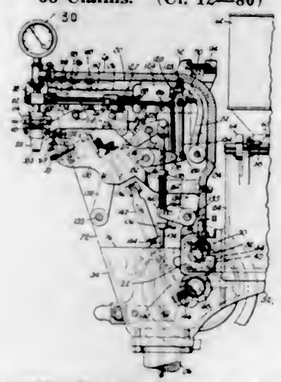


1. A tool for severing the end of fiber tube containers of varying diameters, comprising in combination, a stationary frame having a vertical portion and a trough member associated therewith for selectively supporting containers of different diameter sizes, and a cutting element pivotally mounted in the vertical portion of said frame and slidable bodily therein in a direction transverse to the container to be cut whereby to engage containers of varying diameters, said cutting element being adapted to be rocked on its axis into engagement with a supported container to pierce a wall of the same and for thereafter severing an end of a said container during rotation of the container relative to said tool.

2,100,340

BUFFING WHEEL

Stephen W. Lippitt, Cleveland, Ohio
Application February 3, 1937, Serial No. 123,897
14 Claims. (Cl. 51—193)



1. A buffing wheel comprising a fabric formed from cords of twisted strands of paper.

2,100,341

SHOE BOTTOM COATING MACHINE

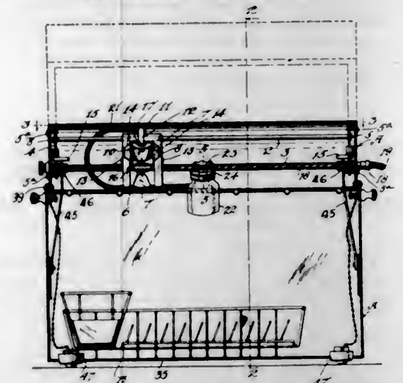
Wilbur L. MacKenzie, Beverly, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application November 24, 1934, Serial No. 754,648
38 Claims. (Cl. 12—80)

1. In an extruding machine, a nozzle mounted on the machine and having a depending flexible work-contacting end portion, and a work-contacting rigid finger mounted adjacent to and to the rear of said nozzle thereby to limit the deflection of the resilient end portion by work raised into contact with the finger and nozzle as the work is moved forwardly beneath the nozzle.

2,100,342

NOZZLE FOR EXTRUDING MACHINES

Wilbur L. MacKenzie, Beverly, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Original application November 24, 1934, Serial No. 754,648. Divided and this application July 11, 1936, Serial No. 90,168
23 Claims. (Cl. 91—43)

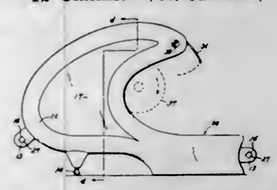


3. A nozzle having a flattened flexible tip portion provided with an outlet opening in a side face of said tip portion and adapted to be deflected by pressure against a piece of work, and means acting directly on said flexible tip portion to resist excess flexure thereof by a piece of work with which the nozzle may be in contact.

2,100,343

FLUID ACTUATED DEVICE

Othmar Maycen, New York, N. Y., assignor to Clarence N. Wheeler, Glen Ridge, N. J.
Application June 10, 1933, Serial No. 675,193
24 Claims. (Cl. 299—49)

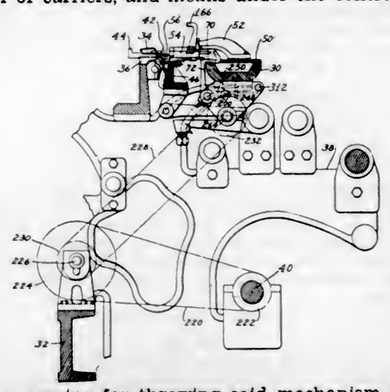


1. A device of the character described comprising a stationary screw, a fluid actuated impeller mounted to rotate coaxially thereon and to coact therewith so as to move longitudinally of said screw upon rotation of the impeller, and a fluid spraying nozzle movable by and with said impeller longitudinally of said screw for directing a fluid jet onto said impeller to rotate the latter.

2,100,344

BUFFING HOOD

Gustav H. Medart, Los Angeles, Calif.
Application January 22, 1937, Serial No. 121,850
12 Claims. (Cl. 51—270)



1. A buffing hood comprising; adjustably spaced side walls connected by cross walls under tension; all of said walls being of resilient and easily stretchable material, and adapted to deflect outwardly under internal impacts.

2,100,345

KNITTING MACHINE

Max C. Miller, Cumberland, R. I.
Application June 8, 1934, Serial No. 729,553
43 Claims. (Cl. 66—145)

1. In a flat knitting machine, the combination with a series of needles movable as a unit and their cooperating knitting elements including yarn measuring sinkers to which the yarn is fed, of a plurality of yarn carriers each adapted for laying yarn along said needle series and for idling adjacent the same end thereof, a yarn severing device for severing yarn extending between the fabric and an idled carrier or carriers, mechanism operating in timed relation to the operation of the machine during the traverse of a selected active carrier to actuate said cutter to cut yarn extending between the fabric and said idled carrier or carriers, and means under the control of

the operator for throwing said mechanism into operation to cut the idled yarn or yarns.

2,100,346

INTAGLIO PRINTING ELEMENTS AND METHOD OF PRODUCING THE SAME

William N. Misuraca, Merrick, N. Y., assignor to Photo-Cylinder Corporation, a corporation of New York
Application June 8, 1933, Serial No. 674,802
13 Claims. (Cl. 95—5.7)

1. The method of preparing an intaglio printing surface, which comprises exposing a film to the object to be reproduced through a half-tone screen and through a diaphragm to produce a series of dots in certain portions of the film, exposing a film a second time to light having uniform intensity and through a half-tone screen and a diaphragm of a character to produce a series of lines in the portions of the film left unexposed in the first instance, making a positive from said film, and preparing from the positive, a resist through which a metallic member is etched to produce the intaglio printing surface.

2,100,347

WOVEN BRAKE LINING, YARN, AND PROCESS FOR MAKING SAME

William Nanfeldt, Clifton, N. J., assignor to World Bestos Corporation, Paterson, N. J., a corporation of Delaware
No Drawing. Application September 21, 1934, Serial No. 744,941
10 Claims. (Cl. 117—53)

1. A yarn suitable for brake lining comprising asbestos and cotton fibres matted together and twisted with a reinforcing filament, and a powdered mixture containing iron oxide coating said fibres.

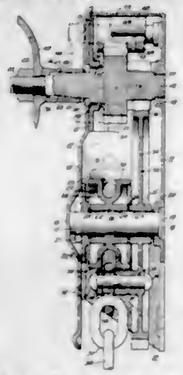
2,100,348

LIGHT BEAM TRANSMISSION SYSTEM

Alexander McLean Nicolson, New York, N. Y., assignor to Communication Patents, Inc., New York, N. Y., a corporation of Delaware
Application April 13, 1934, Serial No. 720,449
4 Claims. (Cl. 250—7)

1. A plural channel signaling system comprising means for generating a plurality of electrical

currents representing individual signals, means for generating light waves, means for impressing said electrical currents directly on said last mentioned means to vary the amplitude of said light waves in accordance with the variations in amplitude of said currents, means for collecting and



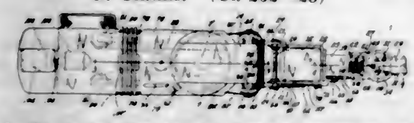
projecting said light to a distant point in the form of adjacent beams, means at said distant point for separating said adjacent light beams into spatially disposed beams, and means in each of said beams for eliminating substantially all light frequencies except a certain desired frequency.

2,100,349

HAND BRAKE MECHANISM

Raymond C. O'Connor, Chicago, Ill., assignor to Union Railway Equipment Company, Chicago, Ill., a corporation of South Dakota

Application December 26, 1935, Serial No. 56,183
4 Claims. (Cl. 74—505)



1. In hand brake mechanism, the combination of a frame provided with a removable cover plate, a gear shaft extending transversely and supported within the frame, a gear wheel, and a winding drum independently mounted upon the shaft and individually rotatable with respect to one another, a brake chain, anchoring means on the gear wheel for the end of the brake chain in position to carry the chain around the drum, and a hand operated gear mechanism for operating the gear wheel.

2,100,350

MINING APPARATUS

Charles F. Osgood, Claremont, N. H., assignor to Sullivan Machinery Company, a corporation of Massachusetts

Application January 2, 1936, Serial No. 57,156
32 Claims. (Cl. 262—28)

1. In a mining apparatus, a swinging arm structure, a cutter support pivotally mounted on said arm structure, a kerf cutter carried by said cutter support, and common motor operated devices having common final terminal elements through which arm structure swing and cutter support tilt are effected for swinging said arm structure and for tilting said cutter support about its pivot relative to said arm structure to move said kerf cutter into parallel cutting planes, said devices operative to effect swinging of said arm structure while said cutter support remains stationary as regards swinging movement about its pivot relative to said arm structure.

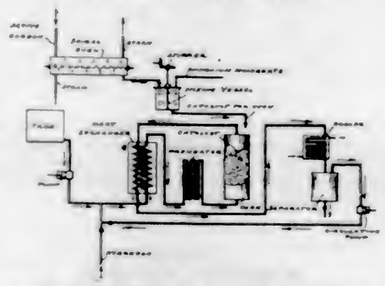
2,100,351

PROCESS OF MAKING PLASTIC SUBSTANCES AND PRODUCT OBTAINED

Joseph C. Patrick, Trenton, N. J.

No Drawing. Application November 14, 1934, Serial No. 752,945
4 Claims. (Cl. 260—6)

1. The process which comprises chlorinating gaseous products consisting largely of hydrocarbons of the olefin type obtained from cracked petroleum hydrocarbons until an oily mixture having a boiling point between about 80° C. and about 200° C. is obtained, and treating the chlorinated mixture with an alkaline polysulfide solution.



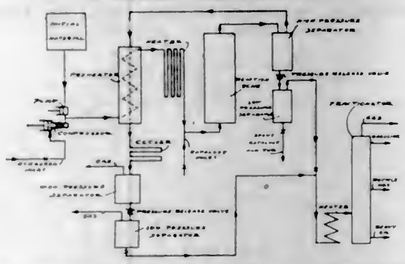
2. A plastic comprising products of reaction between an alkaline polysulfide solution and organic compounds which consist of hydrocarbons of the olefin type obtained from cracked petroleum hydrocarbons that have been chlorinated, said chlorinated compounds having a boiling point between about 80° C. and about 200° C.

2,100,352

CATALYTIC REACTION

Mathias Pier, Heidelberg, and Walter Simon and Paul Jacob, Ludwigshafen-on-the-Rhine, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

Application January 10, 1934, Serial No. 706,044
In Germany January 17, 1933
7 Claims. (Cl. 196—53)



1. A process for heat-treating a distillable carbonaceous material with a hydrogenating gas which comprises acting with said hydrogenating gas upon the said distillable carbonaceous material at an elevated temperature suitable for said heat treatment while in contact with a catalyst consisting of an activated carrier containing carbon which after activation by an activating treatment at a temperature below 500° C. has been treated at a temperature above 500° C. with steam in the absence of said distillable carbonaceous material and which is provided with a substance catalytically promoting the said heat treatment with a hydrogenating gas.

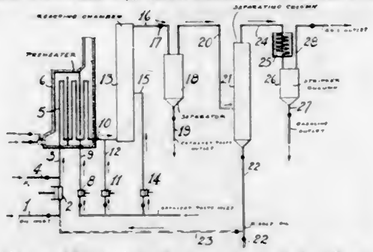
2,100,353

PRODUCTION OF HYDROCARBONS OF LOW BOILING POINT

Mathias Pier, Heidelberg, and Ernst Donath, Mannheim, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

Application May 2, 1934, Serial No. 723,502
In Germany May 19, 1933
1 Claim. (Cl. 196—53)

A process for cracking a heavy hydrocarbon oil into lower hydrocarbon products, which comprises continuously passing a hydrocarbon oil which boils predominantly above 325° C. and which is capable of being cracked into low boiling hydrocarbons together with a small amount of a suspended finely divided sulfur-immune splitting and hydrogenating catalyst and an amount of added hydrogen, sufficient to prevent excessive coking and polymerization, but so regulated that less than 100 liters of hydrogen for each kilogram of normally liquid product leaves the reaction chamber, completely thru a reaction zone maintained under a temperature and pressure suitable for cracking in the liquid phase, continuously discharging the entire reaction mixture together with the suspended catalyst while still under reaction pressure from the reaction zone into a separating zone, continuously withdrawing vaporous products from said zone and separately withdrawing liquid products containing suspended catalysts from said zone, releasing the pressure on said liquid products whereby due to the sensible heat contained in said products lower boiling oils, including gas oil, are removed as vapors therefrom, combining said vapors with products withdrawn in vaporous form from the separating zone, subjecting the mixture to a fractionating operation, recovering a gas oil from said fractionating operation and returning said gas oil to the reaction zone as part of the charging stock containing fresh catalyst.



2,100,354

TREATMENT WITH HYDROGENATING GASES OF DISTILLABLE CARBONACEOUS MATERIALS

Mathias Pier, Heidelberg, and Walter Simon and Georg Grassl, Ludwigshafen-on-the-Rhine, Germany, assignors to Standard-I. G. Company, Linden, N. J., a corporation of Delaware

Application March 9, 1935, Serial No. 10,336
